Two other thinkers from the Marxist stable—Antonio Gramsci (1892–1937) and Louis Althusser (1918–90)—injected new life into ideology studies. Gramsci’s two major contributions were to introduce the notion of hegemony and to explore the real-world practice of ideological thinking. Ideological hegemony, in which a dominant ideology was imposed by a class, could be exercised not merely through state violence but also through cultural means, permeating social life and engendering consensus and ostensible universality. This hegemony could be the basis of a moral and intellectual order. Moreover, rejecting the Marxist depiction of ideology as metaphysical, Gramsci reintegrated philosophical thinking into normal human thought-practices. He distinguished between individual, professionally formulated philosophies, the hegemonic thinking of leading groups, and the faiths and fragmented insights of the masses, all of which combined to form ideological systems.

Althusser identified various repressive apparatuses such as the state, the church, and the military that ensured the ideological underpinning of the existing order and control over the workers. But he broke away from Marxist assumptions in acknowledging that ideology was itself a reality, penetrating all walks of life. It was a feature of human thought that people produced an imagined representation of their relation to the concrete world.

But another strand of considering ideologies was emerging in the social sciences, especially in the United States. Based on field research of attitude and opinion studies, political scientists were investigating empirical and cognitive belief-systems that could be subjected to statistical analysis, rather than as a pathological manifestation of defective thinking. This

behaviorist approach took ideology at face-value as a mixture of rational and emotional explanations for the daily acts and beliefs of the “common man and woman.” This understanding of ideology invested it with an apparently neutral aura, as a resource for generating shared purposes and crafting social visions; yet it was usually applied to the defense of democratic politics. This was partly a functionalist approach to ideology, and it extended that form of thought from ideologues and intellectuals to the population at large in a more decisive manner than suggested by Gramsci. Ideology was thus a grassroots and typical product of thinking, vernacular as well as professional, although bereft of the critical and power-wielding edge that the Marxist version of the concept had accrued. Ideology now seemed destined to stay as a permanent facet of thinking in and about society.

Nonetheless, one positivist, matter-of fact reformulation of ideology converged surprisingly with one of Marx’s and Engels’s conclusions: the anticipated withering away of ideology. But whereas for the Marxists the demise of ideology would be the consequence of negating alienation and rediscovering social truth, for the end-of-ideology prophets—whose voice was heard mainly in the 1950s—the increasing convergence of advanced industrial societies over material ends and lifestyles would render ideology superfluous. That ostensible empirical claim interpreted ideology solely as passionate and extreme political disagreement. Hence, it was blind to the scenario that ideological convergence would still have resulted in the existence of one ideology rather than none, and its apocalyptic macro-perspective typically confused overlap with consensus.

The Symbolic and Linguistic Turn in Approaching Ideology

The next major conceptual input into the comprehension of ideology came from social and cultural anthropologists such as Clifford Geertz, who viewed ideologies as symbolic arrangements that helped to simplify the complexities of social reality. Ideologies provided maps that made sense of social space by guiding their users through a social terrain. Without them, individuals and groups could not orient themselves or express important

aspects of their identity. In addition, such approaches regarded ideologies as renderings of social time: imagined histories of the past and the future through which one or more collective national identities could be fashioned.

The linguistic turn in the final third of the twentieth century had another significant impact on ideology studies. Through focusing on the properties of language and its interpretation, ideologies were now seen as having grammatical and structural properties. The ideas of which they consisted were mutually interdependent and appeared in specific sequences. If liberty was linked to property and security, it obtained a different meaning than when attached to equality and self-development. The emphasis could be transferred onto the microstructure of ideologies. Assisted by Ludwig Wittgenstein's notion of family resemblances, ideologies were now perceived as ranging from relatively coherent and tightly organized ideas and concepts to looser and more fluid conceptual relationships, whose membership was flexible and whose boundaries were vague. Thus, liberalism could shade into libertarianism, but also it could mutate into social democracy at its edges. The identification of many variants transformed the study of ideology into a nuanced examination of the structure and properties of its components that replaced cruder and more simplistic generalizations about ideology as such, or even about major ideologies—liberalism or conservatism—that had tended to single out one or two properties of each.

Recent studies of ideology, consequently, have shifted away from unmasking it to decoding it. On one dimension, employing hermeneutical insights, ideologies are consumed as well as produced. In their more formal manifestations, they are designed to elicit support and activity, but they are simultaneously subject to multiple interpretations that reduce the efficacy of their decontesting role. On another, Paul Ricoeur's phrase the "surplus of meaning" indicates the noncognitive and unintentional facets of political language, when the texts and speech-acts one formulates contain more meaning than intended by their producers. The identification of context serves as an aid to decoding ideologies, as even the same expression of ideas may carry diverse significations, depending on the context in which we choose to hear it. The right to property was at one time a radical cry to endow the socially marginalized and at another a defensive slogan voiced

by the well-to-do. When attached to the term *social*, property loses its individualistic, libertarian coloring, while linking it to *intellectual* endows it with a defense of human creativity and originality.

The association of ideology with power was not abandoned, though, as ideologies became increasingly understood as contestations over the control of political language. As the meanings attached to political words became a focal site of dispute, such insights were separately advanced in the philosophical field through W. B. Gallie's (1955–56) notion of essentially contested concepts, a standpoint maintaining that many concepts were incapable of accruing a precise meaning. Initially that argument referred to the impossibility of agreeing on the worth and ranking of the values embedded in political concepts. Later, a morphological analysis was added, according to which each political concept possessed more conceptions than could be articulated in any of its expressed forms. The choice of which conceptions of a concept to press into service was logically arbitrary but culturally significant: Would, for instance, equality refer to identical outcomes, to similar needs, or to leveling out opportunities? Ideologies were thus particular, decontested, combinations of concepts from among a potentially indeterminate pool of meanings those concepts could channel. This association of ideology with a response to the challenge of semantic indeterminacy combined the typical ideological drive to finality with the impossibility of securing it in a durable manner. Hegemony was replaced with ephemeral and mutating power. Ideologies were therefore polysemic thought-clusters that vied with each other over legitimating or delegitimizing competing semantic renderings of the social world and the practices that obtain within it.

The morphological decoding of ideologies extracts four salient features. Proximity draws attention to the interrelationship of the conceptual meanings that ideologies contain: Each concept within an ideology is crucially informed by the idea-environment in which it is located. Permeability identifies the intersecting of ideological positions, indicating that ideologies are by no means mutually exclusive in their substantive stances, nor are they separated by clear ideational boundaries. That is also true of the main political concepts, many of which contain within their domain other concepts that are at the same time analytically distinct:

Democracy comprises equality, which is a concept in its own right. Proportionality refers to the relative weight that the conceptual components of an ideology possess. Mostly, ideologies are to be distinguished not by the presence or absence of a concept, but by the importance and centrality attributed to it within one ideology in contrast to its downplaying in another.

Finally, priority emphasizes the major political role of ideologies as ranking devices for socially valued or urgent goods. In spatial terms, that is conveyed by the three-band structure of any ideology. It possess a core of ideas that changes slowly, a set of adjacent concepts that fleshes out the core in greater specificity, and a periphery of faster changing ideas and practices that relate to concrete circumstances. The various socialisms will all display the concepts of group, equality, and labor at their core; in adjacent positions, various forms of public ownership, democracy, or time will be bolted on, and colonialism, war, or immigration will serve as particular points of contact between socialism and the world of action. Notably, events on an ideological perimeter may work their way back and impact on adjacent concepts and even on its core. Significantly, an ideological core does not imply an essentialist view of ideology but a statement about the empirically determinable longevity of its central ideational underpinnings.

Post-Marxists, too, such as Ernesto Laclau and Chantal Mouffe, have emphasized the contingency of discourse and the articulatory role of ideology, holding disparate elements together, forming a (transitory) social identity, redefining the individual subject, and bestowing on society a discursive and symbolic unity to counterbalance its internal dislocations and antagonisms, while for Slavoj Žižek, ideologies are fantasmic substitutes for an unfathomable void: the lack of the real world. Discourse analysts have resurrected the critical approach to ideology by harnessing ideology to power practices that either legitimate domination or generate conflict.

Conclusion

Unlike most initial views of ideologies—replicated even by Mannheim—that saw them as preserving and enforcing the social order, the concept now covers various forms of dissent and contention. Some ideologies are

themselves revolutionary in character, such as types of socialism; or pursue strongly antiestablishment politics, such as types of anarchism. Unlike early and mid-twentieth-century views of ideologies as locked in an epic struggle—as liberal-democracy, communism, and fascism were believed to be—societies are now understood to contain a plurality of ideologies, and each may contain supportive and critical elements in different measures. Green ideologies, for instance, are notable for combining radical reform with a great affinity toward caution and conservation.

Ideologies do not merely appear in textual or spoken forms; they may also convey their messages through physical practices such as demonstrations or parades. Much of their impact is visual: in monumental architecture, in art and posters, in ceremonies and rituals, in city layouts and public statuary, and in shrines and road names. Some is aural, through commemorative silences or national anthems.

The pejorative approach to ideology has obscured some of its vital contributions to social life. Ideologies are crucial political resources in mobilizing influence that enables and empowers groups and individuals. They perform a major role in initiating, testing, and reconfiguring the imaginative creativity without which the options for social futures cannot emerge. They assist in translating ideational complexity into communicable terms. As typical forms of political thinking, they are an integral feature of the political world.

Indian Political Thought

India has a distinctive tradition of modern political thought dating back to the late eighteenth century. The first modern thinker of India, Ram Mohun Roy (1772–1832), laid the foundation of the tradition in a synthetic manner by defending many modern Western modes of thinking such as rationalism and reason, as well as ideas such as liberty and liberalism (albeit in a limited way), without delivering a fullblown attack on a traditional social order in India that was based on different paradigms of thought. In other words, Indian thinkers since Roy, including Mahatma Gandhi, have had to grapple with India's pre-British political thought, which was rich and diverse, often synthetic in nature, and powerful (Bhaduri 1998; Ghosal [1886] 1959). Modern

Indian political thought is based on India's ancient civilization and its capacity for accommodation of various foreign elements and ideas brought in by successive foreign political invasions. This has served to give complexity and variety to Indian political thinking as well as some uniqueness (Bhattacharyya and Ghosh 2007).

To be sure, India's modern political thinkers, except a few, were not systematic political philosophers such as John Locke, Thomas Hill Green, and Georg Wilhelm Friedrich Hegel; rather, modern India's political thinkers were at the same time social and political activists engaged in reforming their old society by engaging in political dialogues with the British colonial rule or acting against it. The leader-intellectuals of modern

Indian politics were many, and their thoughts varied enormously too. After Ram Mohun Roy, the most prominent among them were Bankim Chandra Chattaopadhyaya, Rabindra Nath Tagore, Swami Vivekananda, Ramtirth, Surendra Nath Banerjea, Sri Aurobindo, Mahatma Gandhi, V. D. Savarkar, K. B. Hedgewar, Jawaharlal Nehru, Netaji Subhas Chandra Bose, M. N. Roy, Jay Prakash Narayan, and Ram Manohar Lohia.

The changing and challenging social and political context surrounding these leaders meant that there were often inconsistencies in what they thought socially and politically. To give but two examples from Ram Mohun Roy: As a social reformer engaged in the movement for abolition of the practice of *sati* (burning of widows on the funeral pyres of their husbands), Roy had to resort to India's old scriptural traditions of thought to make his argument. And his defense of liberalism in India did not seem (to him) to clash with his defense of Indian feudalism and British colonialism (Pantham 1986b, 32–52). However, the issue of social reform remained a *sine qua non* of modern Indian political thought, and from the so-called Bengal Renaissance (a cultural and literary movement for reform of Hindu social practices and modes of thought starting in the early nineteenth century) onward (Kaviraj 1984; Sarkar 1970), a contentious question in Indian political thought and movements.

For example, as Indian nationalism became more defensive and conservative with the arrival of Mohandas Karamchand Gandhi (popularly known as Mahatma Gandhi, and the “Father of the Nation”) in India's freedom movement from the early twentieth century, social reform in favor of a modern society almost disappeared from the political vision, and often degenerated into so-called village reconstruction, a program that did not contain any radical reform of the hierarchical social order and its accompanying social inequalities and discrimination. Among other activities, village reconstruction entailed the homespun cloth, or *khadi*, and production by manual labor. Scholars have debated Mahatma Gandhi's uncritical defense of the country's traditional Hindu social order, in which he appealed to a higher philosophical ground as part of his trenchant critique of Western civilization. Gandhi's philosophical defense was rooted in ideals of *satyagraha* (truthful action), *dharma* (in Hinduism, religious and moral law governing conduct), and nonviolence derived from the

ancient Hindu and Buddhist thought of India. The implications of this critique for the politics of anticolonial nationalism have also been controversial. While Gandhi was not ready to concede any ground to Western values (or, for that matter, Western civilization as such), most brands of anticolonial nationalist thought were preoccupied with defining the critical space for the coexistence of both Indian values and Western values in India. This is illustrated, among others, in the thought of Ram Mohun Roy, Bankim Chandra Chattopadhyay, Rabindra Nath Tagore, and Jawaharlal Nehru. Tagore, for instance, criticized Gandhi's attribution of the earthquake in Bihar to the curse of the caste system rather than to scientific causes (Bhattacharyya 1997, 158–59; Chatterjee 1986, 1993; Pantham 1986a; Parekh 1989).

Another distinctive feature of modern Indian political thought is its derivative character evident in its mode of thinking, reasoning, and logic, as well as the substantive content of the thought in varied forms and manners such as nationalism, self-determination, statehood, identity, democracy, liberty and freedom, civil and human rights, socialism and communism, civil society, associations and political parties, movements, government, and so on. As Chatterjee (1986) argued, the post-Enlightenment European framework of thought dominated thinking on Indian nationalism, its relation to power, and the need for state power: “formulation of our problem in which our nationalist thought appears to oppose the dominating implications of post-Enlightenment European thought at one level and yet, at the same time, seems to accept that domination at another” (Chatterjee 1986, 37). Its derivative character, however, is not to be seen as its weakness. In many respects, the originality of the thought itself was in fact proved, especially in critiques of European modernity, which remain a running thread in the writing of many social and political thinkers of modern India. Bhudev Mukhopadhyay (1827–94), a relatively less known nineteenth-century Bengal Renaissance thinker with profound originality and insights, formulated a theory of nationhood for India grounded in a basic multiethnic unity (an inclusive theory of Hindus, Muslims, Christians, and aboriginal people) at a time when the Bengal Renaissance movement as a whole had problems with the toleration of Muslims (Bhattacharyya 2007a, 30–45; Bhattacharyya 2010, 48–61).

For a long time after India's independence, a kind of uncritical functionalism and cynicism stood in the way of a true understanding of the distinctive character and originality of modern Indian political thought. Angadipuram Appadurai (1971), in one of the earliest attempts to approach Indian political thought, had its central question thus formulated:

Was there any political thinking in the India of those days?—dependent upon foreign rule, economically poor, and widespread illiterate as she was. Any conception of the State and of the relationship between the State and the individual, of the authority of the State and rights of the citizens and related ideas—liberty, equality, the rule of law, democracy, socialism and nationalism—are usually preceded by a developed civic life, which India did not possess. This question must be broadly answered in the negative in this respect. (Bhattacharyya 2007b, x)

Bereft of the context, that was a wrong way of putting the question. Modern Indian political thought took shape in symbiotic relation between movement and thought or ideas. India's modern thinkers were leaders of social reform and political change. Although some of these thinkers focused on social reform and incremental political change (expressed in such terms as “self-government within the British Empire”), there also were systematic and sophisticated treatises on equality, including Bankim Chandra Chattopadhyay's *Samya* (Ganguly 1975) and Indian Nobel Laureate writer Rabindra Nath Tagore's extensive tract on nationhood (Chatterjee 1993, 67–103). Tagore was critical of the Indian National Congress (INC)—led anticolonial nationalist mobilizations and the dangers of state-centric nationalism to which the INC was committed, while appealing to the people to take charge of the country. As Tagore wrote:

In those days, begging with reddened eyes and threatening the Government with a harsh voice and the fear of the bugbear were considered to be heroic. Today's youth will not understand the unreality of that political exercise. The whole appeal of that politics was to the authorities, not to the people. For that reason, lecturing in

English in the Provincial Conferences and Village Assemblies was taken to be natural by almost everybody. (Bhattacharyya 2007b, xi)

Tagore developed a critique of state-centricity, characteristic of Western civilization, and the political theory that emerged out of it. Distinguishing between this *rashtratantra* (rule of the state) and *samajtantra* (rule of the society), as prevalent in India and China, he argued that in the case of the former, the decline of the state (as a result of war, for example) had meant the decline of the society, as in the case of ancient Greece and Rome. But China and India, he says, have been able to maintain themselves in the face of changes in the state because their trust was widespread over society (Bhattacharyya 2007b, xi).

Strands of Nationalist Thinking

In the analysis of modern Indian political thought, distinctions are often made among different phases, or strands of thought, by nationalist leaders on how India's society should operate after the ouster of British colonialism. These strands include liberal, extremist, conservative, communalist (Hindu and Muslim variety), socialist, and communist. Such strands were connected with the forces engaged in anticolonial movements for India's liberation. In pure theoretical terms, the so-called liberal, or socialist and communist, strands of thought were adapted in complex ways to Indian conditions. For example, certain movements and parties imagined nationhood in Hindu and Muslim communal terms, taking religious identity as the basis for national identity. There were alternative visions of nationhood that sought to construct a nation out of diversity and through diversity, as a pluralist, composite category cutting across caste, class, religion, and tribal ethnicity. This is typified most notably in the writings of Bhudev Mukhopadhyay, Rabindra Nath Tagore, and Jawaharlal Nehru.

For a colonial people who had long existed as an old civilization prior to colonialism, shaking off an alien rule was the most important task. Hence, an anticolonial nationalism, constructed differently at different hands and at different times, remained the cornerstone of modern Indian political thought. Partha Chatterjee considered Bankim Chandra Chattopadhyay

(1834–94) one of the “first systematic expounders of the principles of nationalism” (Chatterjee 1986, 54), but he pointed out, in great detail, the derivative nature of Bankim’s project in that Bankim argued within the post-Enlightenment framework of knowledge produced by Europe. Ranajit Guha (2010), however, would argue that the real precursor of Indian nationalism was Ram Mohun Roy, who had articulated a notion of *swade-shikata* (patriotism), which found its political reincarnation in Bankim (pp. 90–91): In Ram Mohun Roy’s writing, fame, modernity, social reform, and nationalism were mutually interconnected (p. 90).

A distinct socialist stream of thought also took shape in India from the early twentieth century not as a coherent system of thought, but as a body of ideas organically linked to India’s national liberation movements and intended to strengthen the base of the movements. Such socialist ideas were designed basically to provide a theory of emancipation of agricultural workers. Acharya Narendra Deva’s (1889–1956) *Socialism and the National Revolution* (1946), for instance, does not reject the theory of class struggle and appeals to nationalist values (Varma 1961, 20–21). With no sympathy for reformism and constitutionalism, as prevalent in the nationalist movements in India, Deva thought that the only way to mobilize mass action and to make India ripe for democracy was to socialize the nationalist movement by adopting an economic ideology for the masses (p. 671). He advocated that the socialists join the nationalist movements. Jay Praksh Narayan (1910–79) was known as the exponent of total revolution. But his version of socialism, like Deva’s, was inextricably linked to India’s national liberation movement. Narayan argued for the Marxist emphasis on the economic foundation of politics, and he drew attention to abysmal economic exploitation of the Indian masses during British rule, both by the colonial rulers and by feudal landlords. For him, socialism was a theory of social and economic reconstruction of society, but one rooted in the indigenous culture. His socialism included emphasized widespread planning and technological reconstruction of all aspects of society —“harmonious and well-balanced growth of the whole of society.” (Narayan 1946, 88)

Within the broad socialist and leftist tradition, Netaji Subhas Chandra Bose (1897–c. 1945) would be considered profoundly radical in terms of methods

of struggle for India's liberation and the reconstruction of post-liberation India, which were at variance with many of his seniors and contemporaries. A great patriot and desperate for the liberation of his country, he became allied with the Nazis and the fascists for their help in his militant struggle against British imperialism. He was strongly influenced by Vedantic thought and the thinking of Swami Vivekananda and Sri Aurobindo (two great cultural and spiritual nationalist thinkers of modern India), and he was highly critical of Gandhism (despite his great admiration for Mahatma Gandhi, whom he called "the Father of Our Nation" in 1944). His socialism consisted of combining the social and political struggle of the masses, resolute anti-imperialism, and socialism without class struggle. In his famous book, *The Indian Struggle* (first published in 1944), he said:

The logic of history will, therefore, follow its inevitable course. The political struggle and the social struggle will have to be conducted simultaneously. The party that will win political freedom for India will win social and economic freedom for the masses. (Bose 1997, 413–14)

In his more programmatic thinking and plan of action, he advanced the hypothesis that in the future in India, the state would function as an instrument of the masses, especially of the peasants, a new political party with military-like discipline (replacing the Indian National Congress) would look after the interests of the workers, peasants, etc.; stand for complete political and economic liberation of the country; a federal government with dictatorial powers for some time; state-planning; equality for all individuals; cultural autonomy for individual ethnic groups; and so on.

Jawaharlal Nehru (1889–1964), a nationalist leader-thinker and state-builder, espoused a particularly distinctive blend of ideas that combined liberalism, nationalism, and socialism rooted in rationality, science and reason, and the specific Indian conditions. As a socialist, Nehru believed in state planning but did not advocate class struggle and violence as a method of social transformation, preferring democratic peaceful transition to socialism. For him, there was no quarrel between democracy and socialism, and a rigid ideological position was to be abjured. As a nationalist thinker, his theory of nationhood belonged to the "third wave" of nationalism,

which, from the late nineteenth century, advocated that diversity was not a problem but an asset in building nations. His acute sensitivity to India's cultural diversity while promoting unity was symptomatic of such an approach. Finally, secularism was another pillar of Nehru's political thought. For Nehru, it was a social ideal to be promoted for the sake of national unity and progress. His version of secularism was that the state shall observe neutrality in regard to all religions and that religion had no place in democratic politics.

The communists in India envisioned a more radical nationhood for the India of the future. And yet, the communist movements that developed in India in different regions in different times mostly thrived on ethno-regional moorings. However, the communist traditions of thought themselves were varied and changed over time, too. M. N. Roy (1887–1954), a communist thinker of modern India and prolific writer, later turned critical and radical-humanist, who participated in the Comintern debates in the early 1920s on the question of liberation of the colonies with Lenin, and advanced an alternative thesis to that of Lenin (Datta Gupta 2006), was a complex case himself. Commentators like Sudipta Kaviraj (1986, 209–36), for example, found a philosophical continuity between the so-called two phases of Roy, namely, communist and radical-humanist, rooted in his attempts to combine nationalism and radicalism. Roy was perhaps the first to make an ambitious attempt to understand Indian society from a Marxist angle in his “An Indian Communist Manifesto,” published in an obscure Scottish labor journal, but the analysis was not well grounded at all (Kaviraj 1986, 215–16). But in the famous Comintern debate in 1920, Roy, in arguing with Lenin, made an international impact although the Comintern accepted Lenin's thesis that defended communist cooperation with the bourgeoisie in the colonies in their struggle against colonialism. Events in national liberation movements in the colonies such as the withdrawal of noncooperation movement by Mahatma Gandhi in India, and the near total annihilation of the communists in China by the Kuomintang seemed to vindicate Roy's position more than Lenin's. Roy, a virulent critic of Mahatma Gandhi's politics of nonviolence (*ahimsa*) and *satyagraha* (truthful action), himself moved during 1940–47 to radicalism, and then to new integral scientific humanism during 1947–54. His new humanism was centered on the “axiological worth of moral and spiritual freedom, reason and ethics, while freedom, reason and morality

constituted the valuational elements of his Integral Humanism” (Varma 1961, 650).

Gandhi’s Ideas and the Response

In the domain of modern Indian political thought, the ideas of Gandhi are most difficult to analyze and often enigmatic. For one, he was not a systematic political philosopher in the sense we understand the term. His ideas developed out of his varied experiences, or “experiments” in public life. To begin with, his critique of Western civilization and its institutions early on in his political career indicated that little space would be available in his framework of thought to theorize about the state, individual freedom, or an institutional blueprint for future India. He is well known for a few techniques of political struggle and resistance such as *satyagraha* and *ahimsa*, which proved enduring. Unlike Tagore or Nehru, Gandhi was in favor of (re)mixing religion with politics, for he believed they were inseparable, on ethical planes. In his *Hind Swaraj*, he wrote:

Your argument tends to show that there must be a complete divorce between politics and religion or spirituality. This is what we see in everyday life under modern conditions. Passive resistance seeks to rejoin politics and religion and to test any one of our sections in the light of ethical principles. (Rothermund 1986, 297)

However, Gandhi provided a prescriptive democratic solution to the problem of violence in Indian society. This consisted in reorganizing village-based panchayats (village councils) along nonviolent lines. For Gandhi, violence meant exploitation, which means denial of the moral integrity of humans. An analysis of violence and nonviolence, therefore, comprised a large part of Gandhi’s social and political thought. Commentators on Gandhi’s thought have also appreciated his concept of dialogue as a way of discovering truth and have seen his emphasis on the need for tolerance in as a civic virtue essential to democracy (Terchek 1986, 312). Gandhi’s understanding of the relation between the individual and the government of the day smacked of originality of thought:

[M]ost people do not understand the complicated machinery of the government. They do not realize every citizen silently but nonetheless certainly sustain the government of the day in ways of which he has no knowledge. Every citizen therefore renders himself responsible for every act of his government. And it is quite proper to support it so long as the actions of the government are bearable. But when they hurt him and his nation it becomes his duty to withdraw his support. (Terchek 1986, 315)

Thomas Pantham has made a strong case in defending Mahatma Gandhi's powerful alternative to our known world of the ideas, practices, and institutions of liberal democracy—one that especially suited India (Pantham 1986a, 325–47).

A description of modern Indian political thought remains incomplete without reference to a distinct body of ideas advanced since the nineteenth century in favor of social justice, an end to social discrimination, and political empowerment of the members of the lower caste (formerly “untouchables”), who were and still are numerous and who suffered for centuries at the hands of higher caste people in the Hindu caste hierarchy. Although rooted in the social movements and ideas of Mahatma Jyotirao Phule, and E. V. Ramaswamy Naicker (Periyar), such ideas found their most articulate expression going back to the days of British colonial rule, but most prominently since the 1930s, in the writings and activities of Dr. B. R. Ambedkar (1891–1956) who was known as the leader of India's “untouchables” and the father of the Indian constitution. Ambedkar's ideas and approach were at once critical of Gandhi's approach toward the lower castes (Gandhi called them *Harijans*, or “the children of God”), and of Hinduism and its scriptural prescriptions. Ambedkar's ideas were grounded in modernity: industrialization, state ownership (Zelliot 1986, 166), pluralism, equality of consideration, respect and dignity, constitutional democracy, identity, and civil society (Rodrigues 2002, 1–45). More than anybody else, Ambedkar's defense of social justice for the lower castes (now referred to as *dalits*) has since India's independence produced perhaps the most powerful impact in setting the agenda of Indian politics.

Indigenous Political Thought

Indigenous political thought is ancient, and it has profoundly shaped global politics, economics, culture, and science for centuries. As a result of what Antony Anghie describes as the “civilizing mission, the grand project that has justified colonialism as a means of redeeming the backward . . . people of the non-European world by incorporating them into the universal civilization of Europe” (Anghie 2004, 3), indigenous thought has largely, until recently, been erased, ignored, or marginalized in Western discourse. As with most global surveys of a particular category, it is impossible to synopsise “indigenous political thought” without overgeneralization or simplification of complex traditions. There are, however, some common threads that can generally be found between and across indigenous peoples’ perspectives.

Some of these common threads are reflected in the ways in which indigenous peoples were compelled to interact with colonizing/settler state powers. Indigenous peoples engaged in their own brand of international relations prior to the arrival of Europeans, and that international diplomatic tradition was brought to bear in political relations with the newcomers. Following those practices, indigenous peoples continuously asserted their political, legal, economic, cultural, and spiritual perspectives in relations with the nonindigenous world—whether through trade, treaty negotiations, political compromises, or conflict. Between 1882 and 1925, indigenous peoples sent at least seven delegations, just from North America, New Zealand, or Australia, into the international legal and political arena for

negotiations. During that same period, indigenous peoples from other parts of the world (Hawai'i, India, Panama) engaged in independent international relations (Wilmer 1993, 127–28). National self-determination is a core concept of indigenous political thought.

The emergence of the global “indigenous voice” since the 1960s has resulted in a projection into the global state system of a number of theories, ideas, and practices that, among other things, call into question the legitimacy of the state as a model for political organization, that question European-rooted economic strategies whether capitalist or Marxist, that challenge contemporary notions of modernity and development, and that champion egalitarianism and environmental sustainability as fundamental to enduring political frameworks (Barriero 2011; Manuel and Polsuns 1974; Means 1995).

Because of colonizing processes that demeaned, and sought to eradicate, indigenous political and cultural structures, most conventional political scientists are unaware of indigenous histories in this realm. The intellectual void that was created by racist policies such as Manifest Destiny was often filled by deep cultural stereotypes of indigenous politics embodied in the dictatorial “Big Chief,” who, according to the stereotypes, lorded over primitive, brutal, sexist societies. On the contrary, many indigenous societies in the Americas were matrilineal/matrilocal, possessed a positive view of human nature, practiced broad respect for individual liberty and engaged political participation (often through consensus), respected gender and age equity/equality, engaged in periodic redistribution of wealth, and reflected a symbiotic relationship between humans and the total environment. As noted by scholars including Donald Grinde and Bruce Johansen (1991), Andrea Bear-Nicholas, James C. Scott (2009), and Pierre Clastres (1987), most indigenous political societies were highly decentralized and eschewed coercion as a means of achieving respect for and adherence to political decisions. None of this history is to suggest a romanticized notion of indigenous political thought, or to imply there were not deviations from the core values mentioned above. Rather, it contends that scholarly concentration on the exceptions has served to blind political and social science to the essence of indigenous political philosophy and practice.

The quasi-anarchistic, egalitarian, and collective nature of indigenous political economy was especially vexing to European invaders in their colonizing projects. Christopher Columbus, for instance, wrote, “[the Indians] are the best people in the world and the most peaceable” (Letter from Columbus, December 16, 1492, quoted in Todorov 1984, 36), and Bartolomé Las Casas judged that “[the Indians] wisely administered the affairs of both peace and war justly and equitably, truly governed by laws that at very many points surpass ours, and could have won the admiration of the sages of Athens” (Las Casas 1975, 43). More than 150 years later, in Canada, Jesuit missionary Jerome Lalemont reported (1648): “I do not believe there is any people on earth freer than they, and less willing to allow the subjugation of their wills to any power whatever”—a condition that Lalemont derided as “the wicked liberty of the savages.” It was precisely the freedom, generosity, and egalitarianism of indigenous societies that had to be destroyed to coerce them into becoming good colonized subjects (Greer 2000, 36; Leacock 1983, 22–23; Scott 2009, 98–126).

Despite the devastating impacts of colonialism on indigenous societies, a vibrant and dynamic international indigenous peoples’ resurgence occurred in the late twentieth century. As discussed by Deloria (1974), the Akwesasne Notes (1978), and Bruyneel (2007), this movement revived and advanced key concepts of indigenous political thought, including egalitarianism, environmental respect and sustainability, and the need for alternative political and economic approaches beyond the neoliberal state model. Indigenous political thought also included an important extension of conventional decolonization theory, beyond Frantz Fanon and Albert Memmi, in which indigenous peoples’ condition under settler-state colonialism was specifically addressed (Alfred 1999, 2005; Grounds, Tinker, and Wilkins 2003). Indigenous peoples’ decolonization theory, while intimately connected to other critiques of the state such as feminism and postcolonial studies, offers its own unique critique and strategies for the future (Green 2000; Mander 2006; Stewart-Harawira 2007). Anaya (2009) and Venne (1998) have described the ways in which indigenous political thought has served as a catalyst for the development of new and expansive notions of international human-rights norms, resulting in, among other developments, the adoption of International Labor Organization Convention 169 (1989), the United Nations (UN) Declaration on the Rights of

Indigenous Peoples (2007), and the creation of the UN Permanent Forum on Indigenous Issues.

Ongoing areas of intellectual development in indigenous political thought revolve around the intellectual property rights of indigenous peoples vis-à-vis globalized state/corporate interests (Harry 2003); a reexamination of the policies and legal doctrines justifying the colonization of indigenous peoples' territories under the theories of discovery, terra nullius, and conquest (Miller et al. 2010; Newcomb 2008); the international status of treaties between indigenous nations and colonial/settler-states (Alfonso-Martinez 1999); and indigenous prescriptions for environmental respect and sustainability (Morales n.d.; World Peoples Conference n.d.).

Individualism

Individualism

431

432

Individualism

Individualism is a complex idea with multiple connotations. A political definition might be “the doctrine that the rights and welfare of individual persons take precedence over the welfare of society at large,” although this generalization is subject to qualifications. Individualism is opposed to collectivism, an assortment of ideologies that differ greatly from one another but agree that the individual’s needs are secondary to the state’s. In Western political thought, the term has been in use for less than two centuries; before that, virtually everyone found his or her identity in terms of one or more communities. The idea that the individual human has inherent value apart from the community derives primarily from the Enlightenment but also has roots in the Protestant Reformation, industrialization, medieval scholasticism, and even in some ancient philosophers such as Epicurus.

Most philosophers agree that individualism includes certain key features: Each of us has intrinsic worth; we have a right to be guided by our consciences rather than by exterior forces; and we have a right to privacy and a right to realize our potential—“the pursuit of happiness,” as Thomas Jefferson said. In the political sense, these ideas were best expressed by John Stuart Mill, contending that government has no right to prevent us from doing, saying, or thinking anything whatsoever, as long as we do no serious harm to the rights of others, including others’ rights to thought, expression, and action.

During the nineteenth century, “individualism” was often used in a negative sense. Romantic philosophers condemned it as egoistic, leading to the fragmentation of civilized society; and the evolving “isms” were ambiguous about it. An exchange of ideas among French and British Enlightenment thinkers, including Thomas Hobbes, John Locke, and Jean-Jacques Rousseau, led to social contract theory: The individual is sovereign, but an orderly society requires that each of us give up some rights to a government that agrees to protect our remaining rights in exchange for our cooperation.

But which rights do we surrender? A society in which sovereign individuals voluntarily place themselves under authority can range from a participatory democracy like that envisioned by Rousseau or the anarchists at one extreme, to a Hobbesian dictatorship in which a supreme leader expresses the will of the people, or claims that he does, at the other. On some questions those at the extremes agree: For instance, left libertarians (anarchists) and right libertarians (free-market conservatives) both oppose governmental intervention in the private lives of individuals. At the same time, they disagree on such questions as whether corporations have “individual rights” or who “owns” natural resources. In Western thought, individualism is often associated with laissez-faire capitalism: that is, government involvement in the economic activities of individuals should be minimized.

On a more abstract level, philosophers debate whether the behavior of human societies—states, voluntary organizations, religious groups, and so on—can be understood holistically, or must be explained in terms of the conduct and aspirations of each individual in the community.

Methodological individualism argues the latter: Groups are not greater than the sum of their parts, and they can be understood only by analyzing the motives and situations of their members. Others argue that groups have their own dynamic or personality, often citing Nazi Germany’s obedience to Adolf Hitler as the archetype. This view, sometimes called methodological holism, insists that groups do comply with laws that cannot be reduced, even in principle, to the level of the individual. Many philosophers have sought a middle ground, claiming that the ideal individual is one in whom personal freedom and potential are expressed in service to the community as a whole.

Finally, different cultures define the “individual” in different ways, and some radical and postmodern Western philosophers challenge the idea itself. Deep ecology, for example, asserts that because we all exchange matter and energy constantly with our environment, the boundaries of the individual person are arbitrary, and that in fact we are all part of one global “individual,” the biosphere. Gilles Deleuze defines the individual as the nexus of countless desires, blurring the traditional distinction between individualism and collectivism—a trend that will no doubt influence political philosophy in the future.

Interests, Theories of

Interests, theories of

432

434

Interests, Theories of

Subjective accounts of interests in modern political thought take into consideration feelings or attitudes, and theories that incorporate the latter tend to account for sharing by groups of people. Subjective theories of interests also account for claims or demands, and wants. German philosopher Georg Wilhelm Friedrich Hegel's discussion of Roman law in his 1821 work *Elements of the Philosophy of Right*, for example, dwells on the adjudication of interests prior to the term "interest" being linked to monetary affairs. From this area of Hegelian political thought, interests represented an unavoidable starting point in the comprehending of modern subjectivity and self-identity.

In the works of such diverse thinkers as David Hume, Jeremy Bentham, Adam Smith, James Madison, Condorcet, and Jean-Jacques Rousseau, interests and interested behavior were presumed to account for a tacit dimension of human affairs. Hume argued that government for the most part relies on the natural basis of the interests of the governed. From Hume forward, many utilitarian thinkers were characterized as arguing that all moral rules are in fact built up out of generalizations from judgments about various types of interests. Bentham almost always referred to "interest" in the singular rather than the plural, holding that any interest that directs individuals or communities, or that is most ordinarily represented in the form of self-interest or public interest, is itself already an aggregate of commensurable goods. It is also in this utilitarian context that objective accounts of interests are thought of as changes that affect one

advantageously or disadvantageously, as means to satisfying wants, and what is conducive to happiness.

Edmund Burke regarded interests as essential to the smooth operation of social and political processes. It followed that interests were to be properly pursued by those responsible for the well-being of that society regardless of the feelings and attitudes of individual members. Burke did agree with Bentham that the service of interests was a proper objective of moral and political life. However, he disagreed substantially with his understanding of what would count as achieving the objective, notably in rejecting Bentham's account of public interest as an aggregation of individual interest. A later departure from Bentham's account was the twentieth-century moral and political philosopher John Rawls, who rejected the classical form of utilitarianism and its account of interested behavior. Rawls's *A Theory of Justice* (1971) attempted to convey the contemporary significance of interpreting and perceiving groups of interests as values or subjective goals.

Nineteenth-century German social and political thought intersected with the discourses of law and jurisprudence in the emergence of a movement known as *Interessenjurisprudenz*, which treated interest in the broadest possible sense. Jeremy Bentham's *An Introduction to the Principles of Morals and Legislation* (1789) was particularly important in the development of this tradition of legal theory and its relation to modern political thought. The main thesis of *Interessenjurisprudenz* is that legal rules are the result of the clash of different interests represented in a given society, and in the public-political sphere, the conflict is solved either by compromise or by one group forcing the other to recognize its interests to the effect that these interests prevail and a legal framework is conceptually constructed to protect them. Along with *Interessenjurisprudenz* came a theory of types of interests, which often appeared in a living society and the workings of its public-political sphere, not just as a mechanism employed in political and legal theory construction. Bentham's relation to *Interessenjurisprudenz* is found in its distinguishing different types of interests. To a certain extent, it is paralleled by Bentham's effort to find criteria for the different interests. A very different German account of interests was provided by Karl Marx, for whom interests arose out of the

classes that emerged from the dominant mode of production in any society. In capitalism, the chief interests represented in politics were those of the bourgeoisie. But Marx hoped the increasingly organized proletariat would come to perceive its interest as the ultimate overthrow of capitalism and its replacement by communism.

Another later German account of interest was provided in Max Weber's juxtaposition of "ideal interests" with "material interests," both of which, Weber contended, directly governed human conduct. The concept of national interests emerged as a leading theme in this area of his scholarship. Developed from this topic was a distinction between interest-parties and what would become to known as Weltanschauung parties, governed by ideology, belief, and worldview.

Normative descriptions of interests account for more than actual desires. Such descriptions presuppose that persons or groups may be mistaken about their interests. Accordingly, if one wanted to determine his or her correct interests, an attempt must have been made to find out which goals he or she considered more important than others, by virtue of his or her standards. In the normative theories, such persons or groups are taken to be pursuing their interests correctly and therefore not mistaking them, provided they are rationally promoting their own welfare, as they see it, and it is irrelevant whether their purposes agree with my standards or with some supposedly objective moral norms. It is in such a setting that twentieth-century liberal American social and political thought tended to critique and characterize nineteenth-century concepts like Marxian false consciousness as a lack of awareness of one's objective interests. Following in this tradition, recent normative theories of interests represent a type of goal-oriented shift, one in which the resulting reconfiguration renders interests as based on those intrinsic preferences that one should adopt.

International Law

International law

434

435

International Law

Although the origins of international law can be found in earliest times (Roman city-states), modern international law is regarded as relatively young, some 400 years old. The Dutch scholar Hugo Grotius is acknowledged as the father of international law, although the term was initially coined by Jeremy Bentham. International law is frequently denied the status of law, being characterized, at best, as international morality. It is true that if employing John Austin's definition—that is, rules emanating from a central authority that, if broken, carry a sanction—international law will fail the test. However, Austin uses a rigid definition of law, and much of domestic law would likewise fail, as it does not accommodate case law.

International law was not born out of altruism but of necessity: States had to find ways to coexist. It is perhaps through this acknowledgment that a definition of international law is best reached; that is, as that body of rules and norms that govern relations states have between themselves and with other entities. States were the original, and are still the primary, actors in international law. However, the international legal system has increasingly had to take account of nonstate entities, such as international and nongovernmental organizations, national liberation movements, and to a certain extent, individuals. Such entities are not static and may change over time.

The international legal system is premised on the basis of equality of states, but obviously certain states carry more political weight than others.

Although every state theoretically enjoys the same degree of international personality, this is not true for organizations. The extent of an organization's personality will depend on the terms of its constituent document and may be either expressed or implied, as well as the relevant practice of the organization in question. Similarly, the degree of recognition on the international plane to which individuals are entitled is derivative.

Early international law dealt with concepts such as the freedom of the high seas, gaining momentum during the sixteenth-century "age of discovery," which necessitated rules for the establishment of a valid title to territory and the creation of a superior title over disputed territories. During this period, states began to engage more with each other, establishing parameters of activity, and hence, international law is founded on reciprocity and mutual respect.

Historically, the international legal system was not truly international but a reflection of Western European powers. The founding of the United Nations (UN) in 1946 could be seen as symbolic of this Western club of like-minded states. Although international law became more international geographically, in terms of content, it remained Eurocentric, until the 1960s and demands for political independence, particularly in the context of decolonization and self-determination. This was accompanied by a challenge to the content of international law but not to international law per se. Established rules were adapted to meet the demands of new members of the international community. The UN has since grown from 51 original members to 193.

Traditionally, a state's treatment of its own nationals was regarded as a matter for that state alone. However, in the wake of World War II, this changed. In 1948, the Universal Declaration of Human Rights was adopted and further elaboration of the rights contained therein resulted in two legally binding treaties, the International Covenant on Civil and Political Rights and the International Covenant on Economic, Social and Cultural Rights (1966). The possibility for an individual to bring a claim against his or her own state of nationality, as contained within these covenants, was novel and contentious, opening up states' legislation and practices to external review. However, the right of individual petition remains

dependent on a state's willingness to accord such a right. The growth of universal human rights has precipitated debates regarding cultural relativism and accusations of "Western imperialism."

The corollary of human rights is individual responsibility, and increasingly, individuals have been held accountable for their actions, as in the case of the Nuremburg Trials and the ad hoc Tribunals for Yugoslavia and Rwanda. In 2002, the Rome Statute entered into force establishing the permanent International Criminal Court.

As well as its Western bias, international law has faced several other criticisms; for example, from a feminist analysis, its maintenance of the public/private dichotomy is seen as being detrimental to addressing violence against women, most of which takes place within the private sphere.

Ultimately, international law is perhaps best regarded as a mechanism for dealing with issues and disputes rather than a panacea for international conflicts.

International Relations Theory and Political Thought

A leading scholar of the post–World War II period lamented that although political thought had produced a rich vein of theoretical speculation centered on the state and domestic order, the same could not be said about relations between states in an international system of states. This can scarcely be said of international relations (IR) theory today. Nor is the scope of the field limited to the interactions of states in a system conceived solely in terms of these singular, bounded components and the dynamics they generate. From its formal beginnings in the aftermath of World War I, with a set of concerns focused almost exclusively on the causes of war and the conditions for peace in the international sphere, the discipline has expanded into a multidimensional intellectual enterprise examining a broad range of actors, structures, and themes and contributing insights across a range of issues pertinent to political, social, and economic thought from diverse theoretical perspectives.

Two distinctive strands of political thought are commonly regarded as characterizing the early development of IR. In direct response to the horrors of the Great War, a cluster of ideas that came to be labeled “idealist” drew on aspects of liberal thought to theorize an international system in which peaceful relations were supported by robust international institutions even in the absence of a sovereign authority to enforce conformity. The power of human reason could make it so if only the requisite political will could be

mustered. The initial “realist” response derided such approaches as utopian at best, regarding the anarchic international sphere as inherently prone to violent conflict and simply not amenable to projects of perpetual peace. The tragic lessons of history were clear, as were the warnings sounded in a tradition of political realism reaching back at least to Thucydides with subsequent contributions from figures such as Niccolò Machiavelli, Thomas Hobbes, and Carl von Clausewitz.

IR continued to be broadly informed by these approaches throughout the Cold War era although both underwent significant changes, especially in the United States as the behavioral revolution permeated social science scholarship. Neorealism produced a parsimonious theory of the international system that bracketed off normative concerns as unscientific, more sharply divided the domestic from the international, and detached the present more firmly from the past. The structure of the international sphere became the only relevant context for an objectivist, ahistorical style of analysis concerned largely with balance of power dynamics in a self-help system. For its part, neoliberalism maintained faith in the ameliorating effects of international law and institutions while identifying the phenomenon of increasing, complex interdependence among states as an additional key to stability. Although Marxism, feminism, and other critical approaches provided alternative approaches, the sheer size and influence of the neorealist enterprise in the United States ensured its predominance.

The post–Cold War period saw a “new agenda” emerge in IR and, with it, broader developments in political thought along “global” rather than simply “international” lines. Alongside the phenomenon of globalization with its implicit themes of world oneness under the umbrella of a capitalist economic order, numerous tensions produced by the concomitant upsurge in identity politics, failing states, terror wars, financial crises, and climate change have seen IR theory respond through a variety of new approaches or, rather, approaches derived from other strands of social and political thought and applied to the particular concerns of IR scholars in a new global age. Varieties of critical theory, social constructivism, gender theory, green theory, postmodernism/poststructuralism, and postcolonialism now provide students of IR with diverse intellectual resources for attempting to make sense of the world. This is in addition to a stronger profile for

normative international theory and interpretive methodologies, greater interdisciplinarity, and attention to basic epistemological and ontological dimensions of IR theorizing.

IR theory is now a vigorous field of scholarship reflecting a robust discipline no longer overshadowed by political science or “domestic” political theory. As with other disciplines, however, IR now faces the challenges of a world in which emerging centers of power outside of Euro-America are set to challenge not merely its geopolitical dominance, but its intellectual authority too. The question “why is there no international theory?” posed nearly half a century ago has recently been replaced with the equally challenging “why is there no non-Western international theory?” The next half century may see some interesting responses.

Irish Political Thought

The designation in 1541 of Ireland as a kingdom attached to the crown of England created the framework within which a distinctive tradition of Irish political thought was to develop. However, it was only after 1603, following the achievement of stable government throughout the island, that serious debate on constitutional issues began. The question of Ireland's constitutional relationship with England (or Great Britain after the 1707 union of England and Scotland) became a central theme in political thought thereafter and was probed by a number of patriot writers, particularly between 1698 and 1800. A brief outline of the way in which Ireland was governed during this period is required before discussing political ideas. The patriot case for constitutional rights stressed that Ireland was subject to the King of England but not its Parliament. Although this idea of two kingdoms united under one monarch made sense under Henry VIII in 1541, it became increasingly out of touch with the political reality after the Revolution of 1688, as power passed from Crown to Parliament. In practice this meant that the Irish Parliament was under the control of its Westminster counterpart and that Ireland was a kingdom dependent on England. Political participation in eighteenth-century Ireland was restricted to Protestants, and the institutions of public life were populated by a Protestant elite. This was reflected in political thought, which did not argue that Catholics should become involved in political life until the mid-1780s. Most political tracts were the work of Protestants. Catholic authors who did emerge, such as

Charles O'Connor, did not develop an independent strand of political thinking, preferring to make their case in the language of English Whiggery.

It is important to note at the outset that the main features of Irish political thought did not originate with Irish authors but were borrowed from other countries and adapted to suit Irish circumstances. This was clear in the debates over the 1688 Revolution. Irish writers reiterated many of the arguments advanced in England to justify the overthrow of James II, including appeals to divine providence and claims that James had abdicated. The patriot argument for Irish constitutional rights, discussed below, also drew on ideas originating in England, such as John Locke's contract theory and the real Whig tradition. Furthermore, no Irish writers before the 1780s, and only a minority after that, looked beyond the English-style constitution of King, Lords, and Commons.

The Patriot Case for Irish Constitutional Rights

The patriot case for constitutional rights, based on the claim that Ireland was a kingdom independent from England, was the most striking feature of Irish political thought. The foundations of the patriot argument have been traced to the mid-seventeenth century. For example, Patrick Darcy's 1641 treatise asserting the legislative independence of the Irish Parliament has been identified as one precursor of eighteenth-century patriotism. However, the first theoretical assertion of Irish constitutional liberties was William Molyneux's *The Case of Ireland Being Bound by English Acts of Parliament Stated*, published in 1698. Molyneux, a Member of Parliament (MP) in the Irish Parliament at the time, wrote his *Case* in response to the Westminster Parliament's decision to restrict Irish woollen exports to protect English trade interests.

Molyneux's primary aim was to demonstrate that Ireland, as a kingdom independent from England, could not be bound by laws passed in the English Parliament. In doing so, he constructed his case as a series of fallback positions, each providing a separate argument for Ireland's independence from England. Molyneux cited a whole range of historical precedents to show that Ireland's separate status had consistently been acknowledged by English judges and monarchs. Molyneux claimed that

Ireland had voluntarily submitted to be governed by the English crown, through an agreement between Henry II and the Irish Gaelic chiefs. England could not, therefore, legislate for Ireland on the basis that it had conquered the country. This use of precedents became a recurring theme in patriot thought. Other aspects of Molyneux's tract that would feature prominently in the work of subsequent writers included his reverence for the English constitution of King, Lords, and Commons as the ideal form of government and his use of John Locke. Specifically, Molyneux alluded to Locke's argument that all humans were equal by nature and could only be governed by laws to which they had given their consent. It followed that English Acts of Parliament, passed without Irish consent, could have no authority.

The decades immediately after the publication of Molyneux's work brought a change in direction of political thought, as attentions turned toward the Whig and Tory divisions that also characterized political life in England in the same period. However, the issue of Ireland's constitutional liberties reemerged in the 1720s as political controversies over the Declaratory Act of 1720, through which the British Parliament limited the powers of the Irish House of Lords, and Wood's halfpence (involving British minting of copper coins for Ireland), placed strains on Anglo-Irish relations. Jonathan Swift, the Dean of St. Patrick's Cathedral in Dublin, reignited the constitutional debate in his *Drapier's Letters*, written in 1724 in response to Wood's halfpence. Swift portrayed Ireland and England as sister kingdoms, sharing the same King. He emphasized that while Ireland was dependent on the King, it was not dependent on the English Parliament and had its own laws. Swift's work differed from that of Molyneux in its more direct, pragmatic style. He avoided using legal precedents, preferring to base Ireland's claim on natural rights.

The patriot argument presented by Molyneux was used more fully by Charles Lucas, a Dublin apothecary who published a series of controversial tracts in the course of his campaign for election as one of the city's MPs in 1749. Initially concerned with the corruption and exclusivity of Dublin's municipal government, Lucas subsequently analyzed the nature of the Anglo-Irish relationship and sought to demonstrate Ireland's independence from the London Parliament. Lucas's use of historic precedents to show that

Ireland should not be bound by laws made in the English Parliament echoed the work of Molyneux, as did his references to the agreement with Henry II and his appeals to Lockian ideas on government with the consent of the governed.

The main features of Molyneux's *Case of Ireland* remained central to patriot political thought in the late 1770s and early 1780s. This period brought campaigns for free trade and legislative independence, culminating in the removal of the commercial restrictions in 1779 and the abolition of Poynings's Law in 1782, which had placed the Irish Parliament under British control. Henry Grattan, a lawyer and MP who took the lead in these campaigns, turned again to the theoretical argument for Irish constitutional rights in a series of speeches in Parliament. In addition to reciting the by now familiar appeals to precedent to demonstrate that England could not claim a right to pass laws for Ireland, Grattan emphasized the rights of the subject to accept only laws to which it had consented, through representatives in Parliament.

A Patriot “Tradition”?

These authors clearly employed similar arguments in their efforts to prove Ireland's legislative independence from Great Britain, and this demonstrates how the patriot case developed as the eighteenth century progressed. However, the temptation to interpret eighteenth-century Irish political thought in terms of an evolving anti-English patriot “tradition” or “canon” should be resisted since the patriot argument was not always the main issue in public debate. There was much concern about defending Ireland's constitutional rights in the early eighteenth century, resulting from a series of intrusions from London. Similarly, British policy toward Ireland in the late eighteenth century led to further constitutional disputes. However, the constitutional question was of limited importance in the pamphlet literature of the period between the publication of Swift's *Drapier's Letters* in 1724 and Lucas's campaign of 1749. London's more careful approach to Irish affairs, combined with a new obsession with economic improvement, ensured that authors of political tracts in this period accepted that Ireland was, in practice, dependent on Great Britain. Moreover, it was sometimes the case that the key patriot texts discussed above were not representative of

wider Irish political opinion even at the time of their publication. Molyneux's work, although lauded by later patriot writers, was not welcomed by his contemporaries in Dublin, who feared that it would antagonize policy makers in London. Lucas met with a particularly hostile reaction from a political elite alarmed as much by the threat he posed to the established political order as his criticisms of the British connection.

Two further factors indicate that there are problems with the idea of a coherent and widely accepted Irish patriot tradition. First, it must be recognized that many patriot texts were polemical in nature and were usually a response to specific political events or controversies. Often the participants in these episodes were motivated to adopt the patriot argument by political opportunism. Perhaps more significantly, it is clear that patriot texts presenting a theoretical statement of Ireland's independence from the London Parliament often prompted the publication of counterarguments questioning the validity of using historic precedents and legal reasoning. This can be demonstrated by considering the case of Lucas, whose main challenger was Sir Richard Cox, a landowner and MP from County Cork. Cox argued that Lucas's use of precedents was irrelevant since it was only after the Revolution of 1688 that a settled constitution emerged in Great Britain and Ireland. Cox also rejected another cornerstone of the patriot case, the idea that Ireland was dependent on the King of England but not on its Parliament. This was, Cox noted, out of touch with the political realities since the Revolution had ensured that the King was himself under the direction of the Parliament; in practice Ireland's dependence on the King meant dependence on the London Parliament. Cox replaced the theoretical tone employed by Lucas, Molyneux, and later Grattan with appeals to pragmatism and suggested that patriotism was not about constitutional freedoms and legal theorizing but about improving the condition of one's country in the context of the given political circumstances.

The Radicalization of Irish Political Thought

With the issue of legislative independence from England settled in 1782, attentions turned to problems with the system of government that were said to prevent Ireland from enjoying the full benefits of the 1782 reforms. This led to a number of significant new developments in political thought, as

events in America and continental Europe began to influence Irish authors. The era of the American War of Independence produced a marked change in the tone of Irish political debate in general, of which William Drennan's *Letters of Orellana, an Irish Helot* represents the most significant theoretical statement. Drennan, an Ulster Presbyterian, penned his work in the context of a campaign for parliamentary reform. He complained that the 1782 constitutional reforms were unsatisfactory since they left political power in the hands of a corrupt Irish Parliament that was unaccountable to the people. Moving away from the previous patriot position and toward the idea of government through the will of the people, Drennan declared that the British-style constitution of King, Lords, and Commons was not the way to ensure balanced government. Drennan suggested that this desired balance and constitutional liberties could only be protected through frequent parliamentary elections and a wider franchise.

Although Drennan's argument was influenced by developments in America, the French Revolution of 1789 had a further radicalizing impact on political thought in Ireland. The French Revolution helped to reshape attitudes toward the participation of Catholics in Irish politics and paved the way for the emergence of ideas of democratic republicanism. Although Drennan had earlier advocated that political power in Ireland should be regulated by the will of the people, he qualified this position, suggesting that Catholics, still prone to religious prejudice, were not yet ready to be entrusted with political power. This view was challenged in *An Argument on Behalf of the Catholics of Ireland*, published in 1791. Its author, Wolfe Tone, a founder of the United Irishmen and himself a Protestant, argued that the French Revolution demonstrated that Catholics could embrace liberty and that their inclusion in the franchise was essential if Irish parliamentary reform was to succeed. In other respects, Tone's work echoed that of Drennan. He criticized the constitutional reforms of 1782 on the basis that they transferred power to a corrupt Irish political elite and, like previous patriot writers, continued to profess loyalty to the King. It must be recognized that the radical theories emanating from France did not gain universal acceptance. In addition to their radicalizing influence, they also forced many Irish Protestants toward a more conservative brand of political thought, which sought to justify the dominant position of the Protestant elite in Irish society.

The Catholic question remained the central issue in political debate after the eighteenth century. However, the Act of Union of 1801 effectively ended the distinctive Irish tradition of political thought and its claim that Ireland was a kingdom independent from England. In extinguishing the kingdom of Ireland, the Act of Union removed the constitutional framework within which this tradition had developed. Thereafter, the Irish claim for independence was based on the right of the people to self-determination. Romanticism, practical activism, and the mobilization of the people became much more important than the theoretical argument for Irish constitutional rights.

Islamic Political Thought

In Islam, as it was understood by most Muslims at least until the twentieth century, the nature and form of the polity were supposed to have been determined by divine revelation. Recently, however, some have asked whether the political praxis of early Islam was not a human response to particular circumstances.

Islamic Political Thought Up to the Twentieth Century

In traditional Islamic political thought, the only significant human community was the Muslim people (*ummah*). This was led by the Prophet's successor and deputy (caliph), the leader (imam) of the people. His worldwide political, military, and religious authority was prescribed by God. The caliph's functions were to ensure observance of the Shari'a; to spread Islam by teaching, building mosques, funding religious education, and holy war (jihad); to ensure the collection and administration of the alms (*zakat*) that all Muslims were obliged to contribute; and to provide safe public highways for pilgrims. Spiritual and secular authority were not distinguished. The great figures of Muslim legal-theological tradition, such as al-Mawardi (974–1058) and Ibn Taymiyya (1263–1328), vigorously reasserted the unity between the religious and the political even against the grain of their own times.

The overriding purpose of the *ummah* and its leader was to propagate the message given by God to Muhammad in the Qur'an, to persuade all humans to believe in it, and to observe the law (Shari'a) prescribed by God in the Qur'an and *hadith* (sayings of the prophet). This law was supposed to cover every aspect of a person's life, public and private, from marriage and crime to commerce and war. The details of right conduct were the subject of endless debate, much as the details of right belief were in Christianity. Under Islam, jurisprudence rather than theology was the usual touchstone of religious orthodoxy: "[T]he foundation of this religion is jurisprudence," as the late-eleventh-century philosopher and mystic al-Ghazali put it.

The Shari'a was the full and final embodiment of justice. Right and wrong could only be known through God's revelation; human reason could not provide a moral code. The Shari'a emphasized duties above all; it also gave Muslims rights to property and recourse to a judge. The Shari'a was held to have been determined by the consensus (*ijma'*) of the early jurists. Only in recent times was it thought that individuals could undertake fundamental revisions through their use of reason (*jtihad*). Legal expertise bestowed authority on the '*ulama* (lit. scholars) as persons qualified to settle disputes and guide believers.

Those who do not accept Islam, or at least Islamic rule, voluntarily have to be subdued by coercive force. Missionary war was a religious obligation for all male Muslims unless others were already fulfilling it. However, people cannot be forced to believe (Qur'an 2:256). Other monotheists were to be tolerated as protected peoples (*dhimmis*) who could practice their own religion and its laws, but they could not publicize their faith or build new places of worship. For polytheists and unbelievers, it was conversion or death.

The question of how the caliph should be chosen gave rise to the first schisms in Islam. Some held that he should be chosen by a consensus of community leaders; this became the Sunni (lit., traditional) view. Others held that Muhammad had designated as his successor his son-in-law, 'Ali, who in turn designated his successor from his own family, and so on; this became the Shi'ite (lit., partisan) view. After the mid-ninth century, the

Twelver (Imami) Shi'ites believed that the Twelfth Imam had gone into hiding and would one day return to establish perfect justice.

The caliph and ruler was obliged to observe the Shari'a like anyone else, but there were no constitutional limits on his power, and no procedures for getting rid of a bad ruler. A doctrine of nonresistance developed: People should be prepared to tolerate misrule, short of apostasy (according to a popular proverb, "one day of disorder is worse than a hundred years of injustice"). Silence about grievances and tactical dissimulation (*taqiyya*) of one's view of the ruler was regarded as an act of merit; social solidarity was the most important thing.

Classical Islam contributed to the development of political philosophy. The Muslim philosophers of the eighth to twelfth centuries argued that law and the political authority to enforce it arose out of human nature, although the perfect forms of these—caliphate and Shari'a—had been revealed by God. As they saw it, people have to live together to survive; as Ibn Rushd (writing in Spain, 1126–98) put it, people are born with different but complementary natural dispositions. But humans living together are bound to quarrel, so they have to have laws. Laws in turn need a coercive authority to enforce them. Al-Farabi (writing in Iraq and Syria, c. 870–950) equated Plato's philosopher-king with the virtuous caliph. Ibn Khaldun (writing in North Africa, 1332–1406) postulated a theory of social dynamics, according to which people living in the wilderness develop a group spirit (*'asabiyya*) that enables them to overcome urban civilization. But they in turn become civilized and corrupt, and so the process is constantly repeated. This was an attempt to explain the decline of the Islamic caliphate.

Modern Islamic Political Thought

Islamic political thought changed little until the later nineteenth and twentieth centuries. New developments were brought about by confrontation with Western hegemony. Europe now came to be seen either as a model of how states should be organized or as materially advanced but spiritually depraved. Islamic intellectuals reacted to the challenges of European science and material development, and the tremors that these set off across the Islamic world, either by syncretism—seeing certain Western

ideas as expressions of true Islam—by revivalism—going back to the sources of revelation—or by a combination of the two.

In the later nineteenth century, reformists within the Ottoman Empire (the “Young Ottomans” or “Young Turks”) argued that decline of Muslim power resulted from corrupt and tyrannical government. They also argued that the “Western” principles of individual liberty, constitutional government, and representative democracy had been borrowed from original Islam. The political language of Islam could be updated by seeing the original “contract” between caliph and people as a delegation of sovereignty, and the Qur’anic injunction to take counsel (*shura*) as implying parliamentary democracy. Nevertheless the decisions of a democratic majority have to be reconciled with the abstract right laid down by God.

Jamal al-Din al-Afghani (1837–97) declared that the revival of Islam required an active civic spirit and constitutional or republican government. He insisted that Muslims had the right and duty to adapt the social teachings of the Shari’a to the modern age by using their individual judgment to reengage with the original sources of revelation, setting aside later accretions.

Rashid Rida (1865–1935) adopted this approach in his *On the Caliphate (Al-khilafa)*, written in 1922–23 while the caliphate was being abolished by the Turkish revolution. Rida argued that Muslims need a caliph but as a worldwide figurehead who would not supplant existing states; he should preside both over Muslim states and over Muslims living under “foreign rule” in a kind of confederation or “commonwealth.” Rida said that notables or prominent citizens, as well as electing the caliph, should exercise *shura* (consultation) in administration and legislation.

‘Ali ‘Abd al-Raziq (1888–1966) put forth an opposite point of view in his *Islam and the Roots of Governance (al-Islam wa Usul al-Hukm)* (1925). He argued that the caliphate was but a product of historical circumstances, and that it was no longer necessary. Muhammad had intended to found a religion but not a state. Muslims today, therefore, are free to exercise their own judgment on what form of government is best. These two thinkers may be seen as having articulated the basic premises of Islamism and modernism, respectively.

Islamism

Islamism as a social and political movement started with the foundation of the Society of Muslim Brethren (Jam'iyyat al-Ikhwan al-Muslimin) by Hasan al-Banna in 1928. The Muslim Brethren reaffirmed the view that Islam has its own agenda for political, social, and economic life ("Islam is a faith and a ritual, a nation (*watan*) and a nationality, a religion and a state, spirituality and action, Qur'an and sword" [al-Banna, cited in Mitchell 1969, 233]). They aimed to preach and convert as well as to educate and provide social welfare. Political activity was seen as a means to these ends.

The Muslim Brethren were a mass movement. Islamism is sometimes seen as a reaction to social and economic conditions, rapid urbanization, and the dislocation of traditional communities. However, the idea of going back to sources ("fundamentals," *usul*), of reviving an original Golden Age, is almost as old as Islam itself.

Abu'l-A'la al-Maududi (1903–79) promoted similar ideas in India. He returned to a literalist view of revelation and insisted that the Shari'a is unchangeable. He was convinced that, to revive the Shari'a, true Muslims had to get hold of political power. He founded the People of Islam (Jama'at-i Islami) as a spiritual elite. He opposed the idea of a secular state. It is with Maududi that the idea of Pakistan as an "Islamic state," based on a conservative reading of the Shari'a, originated. He described the contemporary state in traditional Islamic terms: The ruler is an elected *amir* (lit., military commander); Parliament is an expression of shura (counsel); and it cannot legislate on matters not covered by the Shari'a.

Both the Brethren and Maududi had enormous influence not only in their own countries (Egypt and Pakistan, respectively) but also in many parts of the Muslim community. The thinker to whom the more radical Islamists today look most for inspiration is the Egyptian poet-teacher Sayyid Qutb (1906–66), whose *Milestones* (*Ma'alim fi'l tariq*; lit., *Signposts along the Way*) was published in 1965. Qutb argued that the Qur'an contains all anybody needs to know about politics. He saw Islamic and Western values as fundamentally different, and he insisted that Islam has nothing to learn from the West. The Qur'an should be read as poetry; it should be

interpreted, not by the traditional *'ulama* but by enlightened individuals using their own sensibility (one is tempted to say, a Leavisite approach). A righteous social and political system can be discovered by the sensitive reader in the pages of the Qur'an. "Islam altogether presents to mankind an example of a political system, the like of which has never been found in any of the other systems known to the world" (Qutb 1953, 88–91). Qutb was imprisoned, tortured, and eventually executed by President Nasser in 1966.

Islamists argue that a comprehensive and precise blueprint for an Islamic state, quite different from anything that can be found in the recent past or at any time since early Islam, can in fact be discerned in the founding texts of Islam, if one looks hard enough. Yet (or perhaps because of this) Islamism is remarkably lacking in constitutional detail. As Nazih Ayubi put it in his *Political Islam: Religion and Politics in the Arab World* (1991, 42), "fundamentalists" tend to dismiss the details of constitutions and governmental procedures—the stuff of practical politics—as "futile arguments about mere technicalities . . . one may search the manifestoes of the Muslim Brethren or the Iranian clerics for a detailed description of what an Islamic *state* or an Islamic *economy* should look like, but such a search will be in vain."

In some ways, the Islamists' view of the legitimate use of violence in domestic or international politics is not much different from that of many Western thinkers. According to Qutb, for example, violence should only be used when peaceful methods have been tried. It is justified as a response to violence by the state. On the other hand, acts of political violence by individuals are viewed by some radicals, not so much as a means to specific political ends, but as self-sacrificing martyrdom, to be pursued as a glorious end in itself, regardless of the consequences.

The Iranian Revolution

The Iranian revolution of 1979, led by Ayatollah Ruhollah Khomeini (1902–89), was inspired by Islamism of a different type. Its political theory was a development of Shi'ite thought. Originally, Shi'ites had adopted quietism to avoid persecution. Only when the Twelfth Imam returned would the faithful be called to political action. But after the Safavids' conquest of

Iran in 1500, some Shi'ite thinkers, led by al-Karaki (c. 1466–1534) developed a political theology of clerical activism. A new category of religious expert, the “well-qualified Jurist (*mujtahid*),” was introduced. These were capable of guiding the faithful by making their own independent judgments on matters of religious law. Collectively, they represented, by means of a kind of trusteeship (*vilaya*), the Hidden Imam. The most eminent Mujtahids were called Ayatollahs. During the eighteenth and nineteenth centuries, when there was little stable or impartial government in Iran, the Mujtahids became the effective leaders of the community.

Khomeini expounded his religio-political theory in *Islamic Government: The Mandate of the Jurist* (originally given as lectures in Najaf, Iraq, in 1970). Khomeini taught that, further, when there is an *individual* Jurist whose learning and justice are sufficiently outstanding, the Hidden Imam's trusteeship falls upon him alone. The *Constitutional Law of the Islamic Republic of Iran* (1979) stated that “during the Occultation of the (Hidden Imam), the Mandate and Leadership (*imamat*) of the Community devolve upon the just and pious Jurist” (article 5). But Khomeini also said that sovereignty originates from the community. The Iranian constitution combines democratic elections with clerical oversight in a manner reminiscent of Plato's *Laws*.

Like the Sunni Islamists, Khomeini insisted that one must establish an Islamic government, and that the example of the Prophet showed this clearly. Put the Shari'a into practice, and all the present-day evils of society and of the whole world will be sorted out. For the Shari'a is God-given, and it was precisely God's intention to cover the whole of human life with His Law, which “amounts to a complete social system” with “regulations concerning war and peace and intercourse with other nations; penal and commercial law; and regulations pertaining to trade and agriculture” (1981, 43). Only an Islamic government can be relied on to implement the Shari'a.

Another inspiration behind the Iranian revolution was the public intellectual 'Ali Shari'ati (1933–77). He assimilated the Islamic philosophy of history with the Marxist. He denounced both Muslim quietism and Western imperialism, whose consumerist culture threatened to become hegemonic

throughout the world. In his *What Is to Be Done: The Enlightened Thinkers and an Islamic Renaissance*, Shari'ati declared that only the revival of independent reasoning (*ijtihad*) will guarantee "permanent revolution." Islam's original mission, he said, had been to liberate the "oppressed," and this nowadays means the poor and exploited in Iran and the Third World. In the Qur'anic perspective, the pursuit of religious truth and the victory of the oppressed are one and the same. (This view has recently been restated by the South African political scientist Farid Ezack.) The Qur'anic view is precisely that the *people* should be empowered through an understanding of "the laws (*sunan*) of history, the laws of social change."

Islamic Political Thought Today

Generally speaking, the principles of popular sovereignty and the rule of law are supported by most Islamic thinkers, fundamentalist as well as liberalreformist, but often only in general terms. For Islamists, the Shari'a is the only valid legal system, so that the legislative scope of Parliament is limited. On the other hand, they tend to see an elected Parliament as the proper instrument for interpreting the Shari'a. Representatives must be properly qualified: They must have the moral and intellectual qualities needed for leadership of an Islamic community.

Islam upholds the sanctity of private property, with wealth being used for the good of the community, especially the less well-off. Every attempt is made to avoid taking interest on loans. It can be seen as a middle ground between capitalism and socialism.

All parts of the world under Muslim rule (the *dar al-Islam*: house of Islam or of peace) were traditionally conceived as a unitary sociopolitical order in which the same worship, rites, ethics, and laws ran without boundaries. The idea that nationality can or should be the basis of civic identity is alien to Islam. But, until all believe in the one God and implement his revealed law, there is a fundamental division between the house of Islam and the house of conflict (*dar al-harb*). The relationship between these was traditionally conceived in terms of jihad, although occasional truces were permissible. Today, however, many Muslim thinkers, such as the Malaysian academic AbuSulayman, argue, on the basis of a different interpretation of the

Qur'anic texts, for the abandonment of military jihad, and for a new world order based on the unity and equality of humankind.

Reformists believe that the Shari'a has to be extensively reinterpreted so as to fulfill its original intention and serve the needs of Muslims today. The traditional concept of *maslaha* (social need) has been developed, by Muhammad 'Abduh (1849–1905), for example, to mean the common good or social utility in general. 'Abduh, who became highly respected as a pious reformer, argued that the whole purpose of morality and law was to promote the common good. This made considerable reinterpretation possible.

An even more radical step has been taken by Mahmud Muhammad Taha and his pupil Abdullahi Ahmed An-Na'im (1946–). Both are from the Sudan. Taha was executed by the regime of President Gaafar Numeiri in 1985; An-Na'im now lives in the United States. Taha developed (under divine guidance, he claimed) a radical distinction between those parts of the Qur'an that had been revealed to Muhammad at Mecca during the initial stage of his prophecy, and those parts that were revealed at a later stage at Medina, when the fledgling Muslim community was struggling for its existence. The former were concerned only with ethics; it was only in the latter phase that, for circumstantial reasons, Muhammad started speaking about political action and the use of force. Crucially, Taha argued that the Meccan stage constituted the fundamental revelation, while the later, Medinan stage was an accommodation to the needs of the time. Therefore, the former overrides the latter they, under the changed circumstances of today, can be set aside.

All the texts that advocate the use of coercive force or compulsion of any kind to promote religion derive from the Medinan period. They may, therefore, be overridden by the more fundamental moral principles proclaimed during the earlier (Meccan) phase. Taha held that the texts that are cited in support of jihad, slavery, capitalism, gender inequality, and polygyny all come from the Medinan period and are for that reason not applicable today.

To say that the Qur'an is an ethical rather than a political document has repercussions on practically every aspect of political thought. For the first time, it gives the textual, Qur'anic initiative to humanitarian modernizers

and liberal reformers. It becomes far easier to put forward a modern, liberal, or socialist agenda within Islam. It also makes it much easier to accept the separation of religion and state. In his most recent work, *Islam and the Secular State* (2008), An-Na'im argues that although it is appropriate, indeed desirable, that religious principles should play a part in political discourse, they cannot be enforced by the state without losing their spiritual character.

This puts the discourse of human rights on a different plane. Traditional Muslim thought denied the equality of women and gave only limited rights to non-Muslim monotheists, and none at all to anyone else. Modern Muslims have struggled to assert social equality for women, but hardly one Muslim thinker—and not a single Muslim-controlled state—has given civil or political rights to non-monotheists; only a few have given civil rights to non-Muslim monotheists. This is even true of the Universal Islamic Declaration of Human Rights (1981). An-Na'im, however, insists unequivocally both on the equality of women and on freedom and toleration for believers of any kind, and for unbelievers. In his view, the universal moral principle of reciprocity stipulates equal rights for all citizens, be they Muslim or non-Muslim, female or male.

Isolationism

Isolationism

445

446

Isolationism

Isolationism, a long-standing strain of U.S. political thought, has traditionally been defined as a refusal to participate in wars outside the Western Hemisphere, particularly in Europe; an opposition to binding military alliances; and lack of participation in organizations of collective security. Above all, the “isolationist” desires to maintain the United States’ autonomy, a freedom of action unhindered by the policies of allies. Such people often differ from pacifists, those who would renounce any war and withhold backing for any conflict. Proponents of the isolationist position usually reject the label, finding it derogatory. As most isolationists oppose “isolating” the United States from either the world’s culture or its commerce, they have long preferred such terms as “neutralist,” “nationalist,” “noninterventionist,” or “anti-interventionist.”

Isolationism centers on the belief that foreign alliances and overseas military involvements would invariably weaken the United States. Those on the right warn against prohibitive taxes, regimentation of the economy, and the loss of classic “republicanism.” Those on the left fear the advent of a garrison state that would obliterate social reform and abolish civil liberties. In either case, the nation would inevitably be weakened, perhaps irreparably so, and risk military defeat.

From 1776 through the early twentieth century, the nation has pursued an isolationist foreign policy. The stance was articulated in such documents as Thomas Paine’s *Common Sense* (1776), John Adams’s Model Treaty

(1776), George Washington's Farewell Address (1796), Thomas Jefferson's First Inaugural Address (1801), and James Monroe's annual message of 1823, in which the fifth president proclaimed the Monroe Doctrine.

Admittedly, the United States engaged in several major conflicts with other powers during the nineteenth century—the War of 1812, the Mexican War, and the Spanish-American War. Yet, because the United States fought all these conflicts unilaterally and not as part of any binding combination, it did not violate isolationist tenets. Even in 1917, when it entered World War I, it did so as an “associated power” and not as a full-scale partner of the Allies. It displayed its determination to remain aloof from coercive international bodies when, in 1919 and 1920, its Senate twice turned down entrance into the League of Nations.

The high tide of isolationism took place during the years 1934–37.

Congress, in an effort to avoid the pitfalls through which the United States entered World War I, passed a series of bills called the neutrality acts. These included legislation imposing an arms embargo to belligerents once the president declared that a state of war existed, a prohibition on loans and credits to belligerents, and a ban on passengers traveling on ships belonging to belligerents. The 1937 law banned the arming of all merchant ships trading with belligerents and gave the president discretionary authority to sell nonembargoed goods on a “cash-and-carry basis,” by which belligerents pay for shipments at time of purchase and transported all goods on their own vessels. In 1934, Congress also forbade private loans to defaulting nations and a year later voted down membership in the World Court.

Once war broke out in Europe in 1939, isolationists fought a rearguard action against American involvement. They opposed repeal of the arms embargo in later 1939, conscription in summer 1940, extension of term limits for draftees in summer 1941, and the repeal of “cash and carry” that fall. Such figures as aviator Charles A. Lindbergh, financial writer John T. Flynn, Congressman Hamilton Fish (R-NY), and Senators Gerald P. Nye (R-ND) and Burton K. Wheeler (D-Mont.) spoke under the auspices of the America First Committee, an organization formed in September 1940 as a clearinghouse for research, lectures, and radio broadcasts. After the war, such “revisionist” historians as Charles A. Beard, Harry Elmer Barnes, and

Charles Callan Tansill sought to prove the wisdom of the isolationist position, even at times finding an administration conspiracy behind the Pearl Harbor attack.

During the Cold War, isolationists met with continual failure. They could not prevent American entry into the United Nations (1945) or the North Atlantic Treaty Organization (1949). When the Korean War broke out, many still opposed collective security but reversed their traditional stance to back the “victory” strategy of General Douglas MacArthur. They failed to enact a constitutional amendment limiting presidential treaty-making power. Although many Americans increasingly opposed participation in the Vietnam War, the Gulf War (1990–91), the Iraq War (2003–10), and the Afghan War (2001–), few could be called isolationists, for they did in principle not repudiate membership in international collective security organizations, overseas military assistance, economic sanctions, or even the use of combat forces in certain conditions. They describe their position as “interest-based policies,” “strategic disengagement,” and “strategic independence.” Remnants of classical isolationism are found in the Cato Institute, the presidential bids of businessman Ross Perot and Congressman Ron Paul (R.-Tex.), and the writings of Pat Buchanan and the editorial staff of *Chronicles* magazine.

Italian Political Thought

Italy is home to some of the earliest reflections on the nature of modern, secular politics and the state. With its ancient Roman and Renaissance heritage, it has provided some of the most widely adopted concepts of political thought: for example, ideas such as “civic republicanism,” the “state,” “liberty,” or the division between “elites” and “masses.” But is there a distinctly *Italian* tradition of political thought? Italy’s late emergence as a nation-state, its enduring medieval traditions and localism, its status as the seat of the Catholic Church, and the relative marginality of liberal ideas in its political development, undoubtedly, have all helped dampen the more optimistic assumptions about modernity that characterize other parts of Europe. If Italian thinkers have largely tracked the dominant concerns of modern political thought and ideology, as we can see below, nevertheless they have been at their most inventive when seeking to debunk some of the dominant myths of modernity. In Italy, where the state has remained relatively weak in relation to the wider society, the aspiration for an autonomous and free political community has been embraced frequently with enthusiasm but often with a realistic awareness of the obstacles that litter the path to its achievement.

The Humanist Heritage

Between the twelfth and fifteenth centuries, the northern Italian city-states—particularly Florence, Milan, and Venice—provided the context for a

series of reflections on the nature of politics and political community that began to stake out a distinctly modern, secular idea of the state. In defiance of the power of Papal authority, thinkers such as Marsiglio of Padua, Brunetto Latini, and later and most famously, Niccolò Machiavelli, defended a republican idea of liberty that drew on classical authors such as Aristotle and Cicero.

Reworking the ancient tradition of rhetorical advice-giving, Italian writers developed a notion of politics conceived as the maintenance of the freedom of the city from arbitrary interference: a practice guided by its own rules, separate from Divine commands, and concerning the governance of humans as imperfect beings. Political knowledge was to be gained from the observation and emulation of human conduct rather than from revealed religion. This “humanist” approach to politics had a vital impact on the early modern development of political thought across Europe. In the works of Machiavelli, in particular, politics was conceived as a practice aimed primarily at securing the autonomy of *lo stato* (the state) from both internal and external domination. Machiavelli has since become notorious for a purportedly amoral conception of politics, as set out in his work *The Prince*, which advocated a ruthless style of leadership, ruling by guile and violence, unrestrained by ethical considerations. But his other writings indicate an enduring normative concern with the freedom of the republic’s citizens to develop their own laws, albeit a concern adapted to the uncertainties of the age.

By the middle of the sixteenth century, however, the city-states had all lost their autonomy and succumbed to the rivalries of princes and foreign powers. Elsewhere, Italian civic republicanism inspired the participants of the English Civil War and, later, the American and French revolutions against the *anciens régimes*. However, in Italy, the legacy of humanism consisted not in galvanizing the forces of modernity but in generating skepticism toward the abstract rationalism and universalism of the Enlightenment. The Neapolitan philosopher Giambattista Vico, for example, famously defended the significance of historical knowledge and cultural variation against Cartesian rationalism in his *New Science* of 1725. Likewise, the humanist tradition imbued many later thinkers in Italy with a marked appreciation of the fluctuating stability of political life in the face of

historical contingencies. In such circumstances, political success has often been put down to the capacity of creative individuals or an elite, rather than political culture generally, to successfully manage the ebb and flow of political fortune.

The *Risorgimento* and Nation Building

A common preoccupation among Italian political thinkers reemerged after the French Revolution of 1789, which rekindled the demand for political liberty and further reflection on the character of the state. The Revolution spurred a nationalistic desire to reform the territorially fragmented, foreign-backed, and mostly monarchical systems across the peninsula. In their place was imagined an autonomous and unified constitutional order based on administrative efficiency and popular legitimacy. The French revolutionary experience dominated Italian political discourse in the nineteenth century, providing not only models to emulate but also rudely exposing the limits to any similar ambitions. Paradoxically, Napoleonic rule over Italy after 1796 raised the hopes of many reformers but effectively reduced the possibility for unification since France's emperor would brook no competition from another European state. After the restoration of monarchical rule in 1815, political repression further limited the opportunities for Italian nationalists. Radical reformers and romantic nationalists (or "patriots") were forced into secret societies, such as the *Carbonari*, which organized various uprisings in the early to mid-nineteenth century.

The broad-based movement for reform was later known as the *Risorgimento* (implying the "resurgence" or "resurrection" of Italy's once great past) and combined both moderate demands for constitutional monarchy with more radical hopes for republican and democratic government. Although broadly "liberal," proponents of national unification were divided about both the means and the goals of the movement. The activist and propagandist, Giuseppe Mazzini—undoubtedly the dominant figure of Italian nationalism—favored a centrally unified state based on universal principles of national solidarity and republican liberty. Mazzini's liberal nationalism often veered into mysticism, imagining a spiritual transformation of Italians into citizens of a state achieved through popular insurrection and common religious

sentiment. For his efforts, Mazzini spent much of his life either in exile or in prison.

Others were much less enamored of Mazzini's democratic ideals. For instance, the economist and free trader Carlo Cattaneo preferred a federal arrangement that would allow the particularism of Italy's medieval communities to flourish, as well as avoid the dangers of a Jacobin-style imposition of unity. The liberal Catholic Vincenzo Gioberti went further, envisaging a confederation of separate states unified by the spiritual authority of the Papacy. Yet, outside the small number of educated intellectuals and a restricted middle class, the wider public—mostly peasants—did not clamor for systematic change.

With differences such as these, it was the moderate rather than the radical liberals who steered Italy to unity under the leadership of the constitutional monarchy of Piedmont in 1861. The unification of Italy (only finally completed in 1871 with the incorporation of Rome) was proclaimed an achievement of national liberty, but its many shortcomings drove political debates well into the twentieth century. The absence of widespread popular participation in the *Risorgimento*, the domination of Parliament by a restricted elite, the church's refusal to recognize the new kingdom, and the authoritarian manner in which the state supported its precarious grip on the diverse and socially divided peninsula provoked deep disappointment among Italian intellectuals. As the statesman Massimo d'Azeglio is famously reported to have claimed: "We have made Italy, now we must make Italians." This sense of incompleteness to the national revolution drove the ambitions of later, postunification thinkers and ideologues still seeking to reconnect people and state.

The Age of Ideology

The lingering problem of how to forge a national community threw up a number of alternative answers in the late nineteenth and early twentieth centuries. These reflected both the prevailing social theories of the time and the contrasting responses to the increasingly "mass" and democratic character of modern political life. The period between unification and the end of World War II saw a proliferation of political ideologies in Italy.

Positivist and idealist strands of thought competed to offer a theoretical horizon against which national reconciliation might be imagined. Neither strand reflected much confidence in the liberal form of government or the prospects for the peaceful harmonization of individual freedoms.

In separate works inspired by positivism, Vilfredo Pareto and Gaetano Mosca provided theories of the “ruling elite” that posited as a “universal law” the tendency for political organizations to concentrate power in the hands of a leading minority. Basing their claims on extensive empirical observation, they ridiculed as “utopian” the socialist demand for popular control over government. Political elites might “circulate” over time, drawing personnel from different social classes, but politics itself always entailed a competition for the rewards of office and the cynical manipulation by the more audacious of those with less intellectual and material resources. Perhaps appropriately, Pareto, a disillusioned liberal economist, eventually supported the fascists. But the conservative Mosca came to endorse liberal democracy, if rather reluctantly. For both, however, the division between those who “lead” and those who are “led” was a fundamental characteristic of all political systems, a view that remained influential among Italian thinkers but that mostly mirrored the customs of its own polity.

Positivism was also influential on the left in the form of Marxism, which from the late nineteenth century became the dominant theory of Italian socialism. Achille Loria had introduced a crudely materialist, economically deterministic doctrine of historical evolution in the 1880s. The Italian Socialist Party, founded in 1892, followed other member parties of the Second International in adopting a popular version of this scientific account of Marxism. Yet, despite its revolutionary credentials, Marxism had little practical impact on the organization of the Socialist Party, which under the leadership of Filippo Turati distinguished its program according to “maximal” and “minimal” objectives. The former referred to the full socialization of the means of production, whereas the latter referred to democratic reforms within capitalism.

A more sophisticated engagement with Marx came from those who opposed positivism, such as the neo-Hegelian philosopher Antonio Labriola. In his

Essays on the Materialist Conception of History of 1896, Labriola rejected naturalistic materialism with its mechanistic account of history in favor of a theory of “praxis” in which thought and action were understood as a dialectical unity. Revolution was therefore conceived as the culmination of a process of development in consciousness and its engagement with the practical world, not a reflex of economic “laws.” Although it strongly influenced the Marxism of later figures such as Antonio Gramsci (1891–1937), Labriola’s philosophy was popular more with intellectuals than with political leaders or the wider public.

Hegelian ideas had also influenced the conservative Bertrando Spaventa, who regarded philosophical idealism as itself originally rooted in the Italian Renaissance and who defended the unified state as the historical culmination of Italians’ self-consciousness. Idealists, in a very broad sense, underscored the role of subjective agency and self-education, rather than blind material forces, in historical change. If for Spaventa the national state was the outcome of this process, for Labriola, it was socialism and the revolution yet to come.

The “historicist” philosophy of Benedetto Croce represented a further development in the idealist tradition. Although not an explicitly political philosopher, Croce’s work encompassed most aspects of life, including aesthetics and politics. He, too, denounced the positivist approach to knowledge as spiritually barren, proposing, instead, to ground truth and value in an open-ended conception of history, conceived as the progressive development of human freedom. Croce rejected both orthodox Hegelianism and Marxism for reducing history to a rigid logic that imposed on it a preconceived trajectory. Instead, he advocated a view of history as a process of interrelated but distinct dimensions of thought and practice, continually advancing in light of new challenges. At first, Croce saw politics as a separate, amoral activity based on an instrumental dimension of human practice. But, in light of fascism, he came to emphasize the way moral ideals motivated key individuals to promote the expansion of freedom.

Croce’s philosophy was enormously influential in the first half of the twentieth century, feeding a desire to release subjective agency from stale metaphysical hierarchies and to renew Italian national culture. Gramsci, for

example, the Sardinian-born Marxist based in Turin, embraced Croce's "historicism" for the cause of revolutionary socialism, conceived as a process of class enculturation. But Croce was, much later, also a source of inspiration to liberal and non-Marxist socialists engaged in antifascist politics in the 1930s who wished to underscore their "faith" in the ideal of freedom.

At the end of the second decade of the twentieth century, however, liberal government and ideas were in profound crisis. That opened the way to more aggressive, antiliberal traditions seeking to replace the state altogether. Anarchist and revolutionary syndicalist movements (the latter strongly influenced by the work of the Frenchman, Georges Sorel) had prospered for decades prior to the war, particularly in parts of Italy's North with its traditions of independent artisans. These continued a long-standing antistatist and anticlerical tradition in Italy, but they had never been mass movements with a large popular following. However, once World War I had polarized Italian society, mass politics burst onto the scene with alternative visions of statehood, from the both the left and right.

In the context of an unprecedented series of strikes and occupations in the northern industrial cities, Gramsci gave the intellectual lead to a distinctive form of factory-based "council communism." Inspired by the Russian Revolution and the soviets, he pictured the factories as the basis of a new state led by the workers. The subsequent failure of this project was followed by the formation of the Italian Communist Party in 1921, based on Lenin's model of the vanguard with the purpose of confronting the state and actively guiding workers to revolution.

But the "revolution" eventually came from the right. Italian nationalism had been a vociferous voice in Italian politics for some time, characterized by an antiliberal and antisocialist message. Figures such as Enrico Corradini and, later, Alfredo Rocco had fulminated vociferously against Italy's low status in the world. But nationalism was effectively reconfigured in the early 1920s in the form of Mussolini's fascism. An unstable and eclectic political ideology, fascism drew from various strands of political thinking—such as nationalism and revolutionary syndicalism—to produce an aggressive, antidemocratic, and often irrationalistic nationalism. Although

its emphases varied over time, fascism offered a robust and violent image of national solidarity based on a model drawn from the experience of the wartime trenches.

Although often derided for their eclecticism and anti-intellectualism, certain fascists nevertheless aspired to offer a coherent political theory with an independent vision of the state. The fascist “totalitarian” state was conceived as unifying all classes and sectors of society in a hierarchical organization, given concrete form through “corporations,” culminating in the dictatorship by the leader. Although in reality this vision was achieved only unevenly, it was given notable theoretical support by Giovanni Gentile, a conservative idealist philosopher and onetime collaborator with Croce. Fascism seemed to fulfill the logic of Gentile’s brand of “actual idealism,” an extreme subjectivism that emphasized the creative unity of thought and action and its culmination in an “organic” conception of the state. Gentile was the ghost writer of parts of Mussolini’s “The Doctrine of Fascism” in 1932 and wrote his own *The Origins and Doctrine of Fascism* in 1934. For his open endorsement of the regime, however, he was assassinated by antifascist partisans.

Mussolini’s dictatorship silenced most political opposition. But in the 1920s and 1930s, antifascism was itself a source of innovation in political thought. Conscious of the past failure of liberalism to win the support of wider social constituencies, liberals and socialists sought out new combinations. Carlo Rosselli, for example, wrote his *Liberal Socialism* while imprisoned by the fascists in 1929. For Rosselli, once excised of its Marxist class-centrism and reconciled to parliamentary democracy, socialism could be conceived as an extension of liberty to all. A similar effort was given more philosophical treatment in the essays on *liberalsocialismo* by Guido Calogero and Aldo Capitini in the 1940s. For them, the elision of the two terms underscored a philosophical identity that might serve as the basis for a new, postfascist state. Such ideas were popular among the intellectuals who populated the antifascist *Partito d’Azione* (Action Party) in the 1930s and 1940s, but they had little impact on the wider population who, after the defeat of fascism and the end of World War II, rallied to the mass parties led by Catholics and communists.

The Postwar Republic

The international divisions of the Cold War dominated much of Italy's postwar politics up until the early 1990s, and this reflected, undoubtedly, in the preoccupations of political theory. Despite Italy's reconstitution as a "democratic Republic," the deep ideological conflict between its dominant parties, the Christian Democrats and the Communists, appeared to affirm a continuing, underlying antiliberal orientation to political debate. Indeed, liberalism remained largely on the margins, both intellectually and politically in the early postwar decades. Nevertheless, by the end of the Cold War in 1989, the values of individual liberty, pluralism, and democracy were relatively well entrenched throughout society, if imperfectly achieved.

Postwar Italian Marxism provided a rich seam of ideas that influenced much of the European left. The publication of Gramsci's prison writings from the late 1940s onward offered a whole vocabulary to radical politics centered on his use of the term *hegemony*. Adapted, somewhat selectively, by the leaders of the Communist Party, Gramsci's work provided a distinctive, if ambiguous, slant to the revolutionary creed of Marxism-Leninism. Gramsci's theory of hegemony recommended the gradual, cultural ascendancy of the proletariat rather than exclusively violent revolution. The Communist Party took this to imply an "Italian road" to socialism, which legitimated the use of parliamentary institutions, at least in the short term, to achieve "structural reforms." But by the late 1960s and 1970s, the stodgy, pragmatic Hegelianism of the Communists was challenged by an explosion of new ideas on the far left. Libertarian social movements—from radical feminism, to gay rights, to "autonomist" communists—questioned the capacity of a Gramscian politics either genuinely to transform society or to mediate the left's increased diversity without authoritarian implications. When this radical effervescence descended into political violence, the communists were brought ever closer to endorsing liberal democratic values.

Indeed, Italy's foremost postwar political philosopher, Norberto Bobbio, had questioned the relevance of the Italian revolutionary tradition from the 1950s. Influenced by the prewar liberal socialist tradition, this legal scholar

was willing, unlike other Cold War liberals, openly to engage communists and challenge them to rethink their seemingly “duplicitous” approach to democratic institutions. For him, Marxist-inspired socialism could not of itself guarantee individual freedom and plurality. In a series of works, such as *Which Socialism?* and *Democracy and Dictatorship*, he defended liberal democracy as the best framework for ensuring a space of civil dialogue free from the excessive politicization of public life that characterized Italy’s “republic of parties.” This point was as much a critique of Italy’s Christian Democrat dominated governments as it was of the dangers of communism. By the end of the Cold War, the Italian left had largely heeded Bobbio’s lesson, distanced themselves from the Soviet Union, and embraced liberal democracy.

Postwar Italy remained without a strong, moderate, and secular conservative party. Instead, communism was faced by an influential tradition of Catholic thought. Profoundly anticommunist, the formal Church had offered a spiritual and organizational alternative to Marxism after the collapse of the fascist state. But lay Catholic political ideas ranged across the spectrum from left to right, although often with a critical eye on the character of modern, consumer society. The conservative philosopher Augusto del Noce, for example, inveighed against modern secularism and rationalism, conceived as detrimental to a properly moral outlook. For del Noce, the atheism of the Enlightenment led directly to modern “nihilism,” and he predicted, correctly, the eventual demise of the Soviet Union. Others, however, such as the Dominican and politician Giorgio La Pira, understood Catholicism to have much more in common with communism in its critique of the atomism of modern society.

In the wider society, the influence of Catholic teachings concerning the family and morality steadily decreased (with the Church’s defeat in the 1974 Divorce referendum, a major signal of changing attitudes). But, with the Christian Democrats occupying office for more than 40 years, the anticommunist wing of Catholicism tended to hold greater sway. That is, until the collapse of communism and, in the early 1990s, the public exposure of an enormous scale of corruption among Italian politicians, which destroyed the Christian Democrats’ electoral base.

The eventual exhaustion of postwar ideological divisions encouraged political thinkers to explore new concerns and wider horizons. Themes such as multiculturalism, the environment, globalization, terrorism, and human rights now take center stage in contemporary public debates and in political theory.

Postmodern thought has challenged the metaphysical hierarchies of philosophy and society from a broadly libertarian perspective. For instance, in the 1980s, the Nietzschean philosopher Gianni Vattimo provided a positive endorsement of the so-called postmodern condition based on what he called the principle of “Weak Thought” (*pensiero debole*) shared by a growing number of philosophers in the West. This antifoundationalist outlook, which paralleled the thought of Jacques Derrida or Richard Rorty, rejected the search for an ultimate or fixed criterion of truth in favor of greater dialogue among different interpretations of the world. For Vattimo, such a view supported a democratic politics oriented toward the emancipation of social groups oppressed by cultural and political dogma.

Similarly, French poststructuralist philosophy has been widely influential in Italy and underpinned the contributions to political theory of figures such as ex-autonomist Antonio Negri who—along with his American coauthor, Michael Hardt—published two widely read works of the twenty-first century, *Empire* and *Multitude*. Moving from a broadly Marxist position, and developing Foucault’s ideas concerning “bio-power,” the authors saw in the globalization of neoliberalism and the incorporation of everyday life into its purview, new opportunities for anticapitalist solidarity and collective resistance. Foucauldian themes concerning the governance of human life were also central to the work of philosophers such as Roberto Esposito and Giorgio Agamben. Agamben’s influential books, *Homo Sacer* and *State of Exception*, introduced into political philosophy the concept of “bare life” to describe what he regarded as the growing tendency of sovereign states to reduce the legal status of certain troublesome citizens.

These concerns with the wider global dimensions of political thought were also reflected in the work of critical liberal thinkers such as Danilo Zolo. Similar to Bobbio, Zolo has interrogated the meaning and practice of democracy today, on both national and international scales. In *Cosmopolis*,

for example, he cast a critical eye on the conceits of “humanitarian” principles and dreams of “global government” that began to circulate in the 1990s. In response to these ideas—and in keeping with a critical tradition of Italian political thought examined above—he underscored the inevitable plurality and potential for conflict that characterizes the international system.

Japanese Political Thought

Modern Japanese political thought has evolved out of premodern intellectual traditions, initially derived largely from Chinese classical sources, and then in turn fundamentally revised during a protracted process of renegotiation as indigenous concepts. Since the mid-nineteenth century, this process has come to be further augmented through interaction with influences from abroad—particularly Europe and North America. As a consequence, modern Japanese political thought is a complex amalgam emerging from the matrix of these varied influences.

The Tokugawa Legacy

From 1603 until 1868, Japan was ruled through the Tokugawa Shogunate, a clan-based military dictatorship that established an unshakeable hold on power through the fixing of caste status, ranking of clans according to allegiance, and a system of “compulsory attendance” in Edo (later renamed Tokyo). Profoundly linked to this system was an imposition of ideological orthodoxy—a Japanese adaptation of Chu Hsi Neo-Confucianism (*Shushigaku*), which consisted of an intellectualized exposition of the existing social and political structure in terms of immutable principles and relations. The country was formally isolated from 1641 onward with only one closely guarded trading port established in Nagasaki for the Dutch and Chinese.

From the mid-eighteenth century onward, largely as a result of intensifying social and economic crises, increasingly open dissent toward this orthodoxy emerged, drawing from either the more proactive Confucian doctrine of Wang Yang-ming (*Yomeigaku*) or the new school of “nativist” intellectual enquiry broadly referred to as “National Learning” (*Kokugaku*), which itself sprang from an earlier phase of academic engagement with ancient literary texts such as *The Record of Ancient Matters* (*Kojiki*, 712 CE).

By the 1830s, political dissent became more intense as the great famines of the Tempo era were regarded as signifiers of the culpability of the Tokugawa regime for contemporary social ills. The arrival of the U.S. Navy’s “black ships” under Commodore Matthew Perry in 1853, and the ensuing capitulation to demands for the opening up of trade, is generally regarded as the pivotal moment that gave urgency to the question of fundamentally redefining the intellectual foundations of legitimate political rule.

The Meiji Restoration

“Restore the Emperor and Expel the Barbarian” was the rallying slogan for critics of the Tokugawa regime, but the political thought informing these aims was diverse. The current of political thought that would ultimately inspire the Meiji Restoration of 1868 grew from the aforementioned schools, particularly *Yomeigaku* and *Kokugaku*.

Yoshida Shoin was arguably the most distinctive thinker to distill these disparate elements of thought into one manifesto. His concept of a unitary citizenship subject directly to the Emperor (*Ikkun Banmin-ron*), coupled with a program of active insurgence that included using nonsamurai militias, was a decisive break with the essentially caste-riven structure of the Tokugawa state. His academy in the Choshu domain was to produce several leaders of the Restoration.

The Restoration of Imperial rule in 1868 ushered in an era of profound political change. Although ostensibly aimed at fulfilling the goal of restoring the Emperor and expelling foreign influence, the new government, led by a coalition of court officials and lower ranking samurai (primarily

from the Satsuma and Choshu clans), proceeded to disestablish the former clan domain and caste system, while adopting Western models of reform and development for key areas of national infrastructure.

After the return of a government mission to the United States and Europe in 1873 (the Iwakura Mission), a program of national “enlightenment” was promoted through the press and the arts. Often referred to as the Meiji Enlightenment, this is primarily associated with the Meiji Six Society, which was established by Mori Arinori (later to become the first Education Minister) and joined by a number of luminaries, including Fukuzawa Yukichi, who was a prominent popularizer of Western learning and civilization and eventually founded Keio Gijuku University.

The success of this movement in reorienting popular conceptions of political discourse is contestable; however, from the 1870s onward, Western political theorists, from Thomas Hobbes, Jean-Jacques Rousseau, and Montesquieu to Jeremy Bentham, J. S. Mill, and Herbert Spencer, came to be translated and disseminated widely among the intelligentsia.

Toward Representative Government

After the unsuccessful Seinan Rebellion in 1877, where the government quelled the last vestiges of armed resistance led by the former samurai caste, political conflict transferred to the arena of agitation for representative government. Accordingly, the full array of Western liberal democratic thought was invoked to support claims for a new form of constitutional government; this is commonly referred to as the Freedom and People’s Rights Movement. After protracted activism and suppression, the government finally acquiesced in 1881 and promised to consult and draft a new constitution within the decade.

The Freedom and People’s Rights Movement continued to be active throughout the 1880s with figures such as Hoshi Toru and Tokutomi Soho making particularly effective use of mass-produced broadsheet newspapers on the Western model. However, this period was also characterized by increasing conflict with neighboring governments in Korea and China, with intensified chafing at the perpetuation of “unequal” treaty provisions with

the Western powers, particularly the loss of jurisdiction over foreign miscreants (viz. the extraterritoriality provision).

The Meiji Constitution came into effect in 1890 and ushered in a series of disruptive elections and stalemated parliaments. Slowly the practice of managing elected assemblies and coordinating cabinets appointed directly by the Emperor became more stable. The increasing likelihood of armed conflict with China also served to galvanize the public in support of a united system of government.

The Reemergence of Nativist Political Discourse

By the late 1880s, a new school of “nativist” thought began to emerge that started to question the applicability of Western political models to Japanese society and culture. Intellectual journalists such as Miyake Setsurei and Kuga Katsunan were particularly significant in reemphasizing indigenous cultural traditions, including Buddhism, in publications such as *Japan* and *The Japanese*. They promoted the concept of the “national essence” (*kokusui*), and their political commentary became a key precursor to the emergence of a form of particularized nationalism based on the nation’s unique polity (*kokutai*).

At the same time as the Constitution came into effect, the Imperial Rescript on Education was promulgated; it articulated an official view of the essentially Confucian aims of education, particularly as they related to fostering piety toward parents within the family, and loyalty toward the Emperor within the state. This signified a reintroduction of the key motifs of classical Confucian thought as an ideological underpinning to Imperial sovereignty. The document became the focus of debate as scholars sympathetic to Christianity, or at least a secular view of the state, clashed with advocates of an interpretation based on a distinctive Japanese spirituality. Advocates for the Rescript included established academics such as Inoue Enryō and Inoue Tetsuro, who wrote a famous treatise in defense of the document. Ultimately the Rescript became a key vehicle for ensuring the indoctrination of citizens toward loyalty to the state.

After the victories over China in 1895 and imperial Russia in 1905, “nativist” and nationalistic discourse became more pronounced. At the same time, however, the emergence of a new urbanized working class and a left-wing intelligentsia inspired by Marxist writings came to be a more significant factor in national politics.

Taisho Democracy

The Emperor Meiji was succeeded by the Emperor Taisho in 1912. The Taisho era (1912–26) was a culturally vibrant but politically turbulent epoch. Although on the side of the victors in World War I, Japan did not enjoy stability and prosperity. The postwar period saw the emergence of a new wave of political activism, and broad-based urban protest led to the revision of the Constitution.

The liberal intelligentsia, led by figures such as Yoshino Sakuzo, enjoyed considerable influence during this period, and in 1918, Hara Kei of the *Seiyukai* party became the first Prime Minister to accede to the post from within a popularly elected party as opposed to being an appointee of the Emperor. Impetus toward expanding the electoral franchise culminated in the passing of the Universal Manhood Suffrage Law in 1925. Nonetheless, civil unrest continued unabated, and the Tokyo earthquake of 1923 had a decisively devastating effect on the national economy and public morale.

Socialism was to chart an unusual course of development from this time onward. On the one hand, figures such as Osugi Sakae propagated a radical and doctrinaire anarchism that made him a regular target of official repression. By contrast, Kita Ikki endeavored to weave notions of the national polity with socialism, producing an idiosyncratic fusion that was to lead him to support unqualified authority of the Emperor in his *Outline of a Plan for Reorganizing Japan* (1919). His writings were regarded as essential reading in the 1930s by ultranationalists.

Feminism also held some currency in political thought as the “Blue Stockings” led by Hiratsuka Raicho agitated for women’s political rights. More radical feminists such as Ito Noe also emerged and gained notoriety

for their indifference to patriarchal conventions within contemporary society.

As evidence of the degree to which intellectual orientations could be transformed, Tokutomi Soho, the former advocate of Western liberalism, promoted the concept of an Asiatic Monroe Doctrine and, along with a number of other influential contemporary commentators, began to promote a form of Pan-Asianism that placed Japan at the center of deciding Asia's future.

Ambivalence toward Western ideas and culture found a more sophisticated expression among a solid core of philosophers who engaged in a rigorous exercise of reflection, critique, and synthesis, producing the work that ultimately came to be grouped together as the Kyoto school. Key influences were predominantly from Germany or, as in the case of Nishida Kitaro, a combination of Germanic phenomenology and American pragmatism. Watsuji Tetsuro also produced some of the more idiosyncratic but accessible works. Watsuji critically engaged with the philosophy of Martin Heidegger to develop a distinctive concept of the subject (the "contextual"), which he contrasted with Western rationalist conceptions of the individual. In 1935, he published a still widely cited work *Climate and Culture (Fudo)*, which explored the relations among society, culture, and climate.

The Collapse of Civilian Government

The Great Depression was arguably the catalyst that ultimately engendered the collapse of civil government in the face of a strident military that found increasing support among a public disillusioned with parliamentary politics. Marxist intellectuals were initially vocal in their condemnation of the rising tide of militant nationalism, and there were cases of prominent academics at the Imperial universities who refused to bow to pressure from ultranationalists.

Eventually, however, political censorship prevailed. From 1932, only one official socialist party, the Social Masses Party under Abe Iso, was recognized by the government, with all other left-wing political organizations suppressed. In 1935, Minobe Tachikichi, the Professor of

Constitutional Law at Tokyo Imperial University, was forced out of his post for his longstanding theory of the Emperor as “an organ of government”—a view that was regarded as treasonous by advocates of interpretations based on “the unique national polity.”

After the army’s annexation of Manchuria in 1931, the military became increasingly emboldened in its intervention in political life. On May 15, 1932, after an earlier attack on leading government and business figures by a self-styled “Blood-Pledge Corps,” a group including naval officers assassinated the then Prime Minister, Inukai Tsuyoshi. On February 26, 1936, there was a revolt led by young officers of the Imperial Army in the name of the Emperor, providing a further emphatic indication that civilian government was in a serious predicament.

Full-scale war with China commenced in 1937 through the Marco Polo Bridge Incident. Japan joined the Axis powers in 1940, and preparations for expansionist military operations continued. In 1940, all political parties were dissolved and subsumed within the Imperial Rule Assistance Association.

After the attack on Pearl Harbor on December 7, 1941, Japan was fully at war in the Pacific against the Allies and embarked on the creation of a Greater East Asian Co-Prosperity Sphere. The expansion of the Empire was portrayed as a war of liberation for “all Asians,” albeit within a structure of suzerainty to the Japanese homeland. The ideological basis for this program drew emphatically on the tradition of Pan-Asianism first developed in the earlier part of the century.

Internally, the Japanese population was subjected to more emphatic ideological demands to make sacrifices for the nation on the basis of an obligation to protect the sanctity of the Emperor. Since 1937, Ministry of Education publications such as *Kokutai no Hongi* (“The Principles of Our National Polity”) were employed to outline a distinctively non-Western premise of Japanese political rule that was embedded in the divine authority of the Emperor.

Defeat and National Reconstruction

Japan's postwar political development was profoundly conditioned by the harsh reality of unconditional surrender and occupation under the Supreme Commander for the Allied Powers (SCAP), General Douglas MacArthur. In tandem with the wholesale replacement of the Meiji Constitution with a new "made-to-purpose" Constitution, including the famous ninth article renouncing the right to wage war, SCAP set about reconstructing the infrastructure of government, business, and education to facilitate the "democratization" of the former enemy.

The electoral franchise was expanded to include female voters, and labor laws were reworked to permit unionization. The former super-conglomerates of the business world (*Zaibatsu*) were forcibly dismantled. Political association was also freed from proscription, and in a controversial move, Emperor Hirohito was coopted to support the new government, not as a living god, but as a constitutionally "symbolic" monarch.

Postwar Political Thought

Within this context, Marxist thought reemerged from its earlier era of proscription with renewed vigor, albeit not without internal contradictions. The reactivated political parties of the left, the Japan Communist Party (JCP) and the highly factionalized Japan Socialist Party (JSP), contained persons who had been imprisoned during the war alongside those who had cooperated with the ultranationalist government. The point of common interest for Marxist collaborators lay in a rejection of Western "modernity," which they were happy to repudiate in as strident terms as the advocates of national purity (regarding it as synonymous with capitalism). In the immediate postwar period, "democratization" was accepted only in the limited sense of being a necessary transitional stage toward full Communism. Consequently, there was an uneasy relation between intellectuals who fronted for Marxist political parties and those who advocated non-Marxist lines of democratic reform.

This political outlook took on an added intensity with the Chinese Revolution in 1949. Left-wing intellectuals such as Takeuchi Yoshimi could see evidence of an Asian alternative to Western "modernity" that renewed determination to resist Western prescription for political reform. The

Communist revolution in China engendered a profound rethinking of the policy of democratization in Japan by SCAP as the more radical elements within the left who aligned with either the Soviet Union or Communist China became perceived as a potential threat to future political stability.

During this same period, Maruyama Masao emerged as one of the most significant scholars of modern Japanese intellectual and political development, and he was particularly criticized by the left-wing intelligentsia for considering “modernization” in non-Marxist terms. One of Maruyama’s key concerns was the failure of Japan to experience “modernity” in the Western sense, however one might conceive it. Steeped in a thorough knowledge of premodern traditions, he set about developing a rational explanation of the key mechanisms of domination and subjugation that had emerged since the Meiji Restoration, evoking his famous reference to a “community of fate” to describe a condition where there was no core belief system; there were only concentric circles of responsibility, and none within the circles felt they had any control. His writing on this subject was translated into English in 1963 under the title *Thought and Behaviour in Modern Japanese Politics*.

Even so, postwar political thought was for several decades dominated by a schism between the left-wing intelligentsia, who maintained a sustained Marxist critique of Japanese history and the contemporary political system based on the concept of the “Emperor System,” and a rump of intellectuals who were either apologists for the past and present or simply held views that could not be easily categorized. However, in 1955, Hatoyama Ichiro, who had been freed from previous restrictions on political participation, began forging a new coalition of conservative political interests, resulting eventually in the consolidation of both the Liberal and Progressive parties into the Liberal Democratic Party (LDP). This new force in Japanese politics was to form the basis of what, in effect, was a one-party rule for the next 38 years.

From 1955 on, the JCP and JSP had fluctuating success with the Japanese electorate. Miyamoto Kenji had extraordinary longevity as leader of the JCP (until 1977), but issues such as pollution, the “Emperor-system,” and the continued accommodation of the American military in Okinawa, rather

than Marxist doctrine per se, provided these political parties with a platform to garner protest votes when failure of the LDP became particularly pronounced. One other area where political debate remained focused concerned the official vetting of history textbooks for schools. Ienaga Saburo famously went to court to have his Ministry of Education–commissioned textbook published as written, without alteration to the commentary on the invasion of China and the role of the Emperor. These have remained highly contentious issues to the present.

The Rise of “Japan Inc.”

The basis for the stability of LDP rule stemmed from a focus on the effective managerialization of the economy that entailed prioritizing the efficient coordination of all resources (including labor, materials, and energy requirements) for the unimpeded expansion of manufacture and export. The Ministry of International Trade and Industry became synonymous with the perception of Japan as a nation organized for business (“Japan Inc.”).

An important support for this approach was provided through a rigorous national system of educational assessment that was crowned by the best national and private universities, and ultimately led to the best employment, often for life. Although ostensibly a meritocratic device, the system of entrance exams became associated with the social issue of “exam hell.” It did, nonetheless, contribute substantially to the perception that success could be found through hard work and study.

If there were ideological differences to be resolved within the LDP, they tended to revolve around the protection of domestic manufacture and food security versus the option of integrating Japan more thoroughly within the world economy and opening the still relatively highly integrated system of state-owned corporations to the possibility of privatization and/or deregulation. Although these issues in Western democracies might well engender two disparate political parties, a system of two major political parties alternating in power did not emerge in Japan for almost four decades.

In the 1980s, Prime Minister Nakasone Yasuhiro was arguably the most decisive figure in pulling Japan in the direction of the more globalized policy perspective, and he had significant success in breaking up and privatizing both NTT and Japan Rail. Even so, the tendency to return to protectionism or centralized coordination for key infrastructure never entirely disappeared. This led commentators to develop particularist accounts for Japan's success, occasionally characterized by optimism (e.g., Ezra Vogel, *Japan as Number One*) or anxiety (e.g., Karel van Wolferen, *The Enigma of Japanese Power*).

Japan and Neoliberalism

After the bursting of the so-called “bubble economy” in 1991, it was broadly expected that the last vestiges of domestic protectionism, state-funded infrastructure development and overregulation, would be swept away. This is not entirely what followed.

In 1993, the LDP lost power for the first time since 1955 after the defection of key factions within the party to a new coalition of opposition parties led by Hosokawa Morihiro. After Hosokawa's brief stay in power, the 1994 election produced a surprising coalition of the LDP with their former arch-enemies the JSP. Murayama Tomiichi of the JSP was appointed Prime Minister, but the LDP held the remaining significant policy portfolios.

This short-lived arrangement was replaced by a reinvigorated LDP in 1996 under Hashimoto Ryutaro, who committed to deliver on a promise of initiating a “big bang” of reform within the Japanese system—essentially a more thorough implementation of a neo-liberal program of “small government” and deregulation. This met with political stonewalling and obstruction within the party, and Hashimoto was eventually replaced by Obuchi Keizo, who returned to an “old school” consensus approach that carried out piecemeal reform of the financial sector to deal with the residual issue of bad debt lingering from the financial crisis of 1991. Overall, Obuchi enjoyed success on several fronts but died in office in 2000, leaving an unexpected political vacuum.

The government of Prime Minister Mori, Obuchi's successor, limped through its term until Koizumi Junichiro challenged and won the leadership of the LDP. He secured a relatively sustained term of office (2001–06) and succeeded in pushing through the partial privatization and deregulation of various operations within Japan Post.

The ultimate result of the Koizumi reforms from an ideological point of view is not altogether clear. His legacy with regard to the LDP was to dismantle the structure of high interdependence among party, bureaucracy, and business, and its system of clanlike factions. The idiosyncratic leadership style did not translate into a political platform that others could run with.

Within two years of Koizumi's resignation, the relatively recently emergent Democratic Party of Japan formed a new government that emphatically demonstrated the willingness of the electorate to reject the LDP and install an alternative government. Even so, the ideological platform of this party is still in a relatively formative stage, and clear tenets of distinction have yet to emerge.

Re-emergent Nationalism

Since Prime Minister Hosokawa's unprecedented apology to the victims of Japan's aggression in World War II in 1993, followed by an even more emphatic apology from Prime Minister Murayama in 1995, the issue of Japan's wartime responsibilities reignited a broader debate about Japanese patriotism. In 1996, an association of revisionist academics (*Atarashii Rekishi Kyokasho wo Tsukuru Kai*) promoted a new textbook for junior high schools that would rewrite the "masochistic" version of Japan's wartime conduct. This included an avoidance of the characterization of Japan's war with China as an act of unilateral aggression and a questioning of the reliability of reports about the Rape of Nanking.

Even Obuchi engaged in the politically contentious issue of requiring schools to raise the national flag and sing the national anthem. These ceremonies were regarded with hostility by left-wing-aligned educators

who associated them with the Emperor system. The legislation was passed in 1999 and became official policy.

Koizumi was also noted for his persistent visits to the Yasukuni Shrine to show respect for the war dead, which infuriated Chinese observers because the Shrine included the interned remains of “Class A” war criminals. This nonetheless proved to be popular with the electorate and built a reemergent sense of nationalism.

Conclusion

The emergence of Japan as a leading manufacturing and financial power from the 1980s did a great deal to take the heat out of earlier ideological conflicts between the traditional left and right, and it has become possible for historical analysis and political commentary to free itself gradually from the earlier binaries. Nonetheless, the earlier certitudes of national policy management have largely evaporated so that Japan finds itself in the midst of a policy vacuum. The recent Tohoku Disaster of 2011 has exacerbated this condition.

463

Jefferson, Thomas

Thomas Jefferson (1743–1826) was the third president of the United States, a political theorist, and a representative of Enlightenment thought. Jefferson was born in Albemarle County, Virginia. He graduated from the College of William and Mary in 1762, studied law under George Wythe, and was admitted to the Virginia bar in 1767. After he entered the House of Burgesses in 1769, public affairs increasingly occupied his time, and he soon became a leading opponent of British oppression of the colonies. *A Summary View of the Rights of British America* (1774), *Declaration of the Causes and Necessity for Taking up Arms* (1775), and the *Declaration of Independence* (1776), all drafted by Jefferson, made him the major penman of the American Revolution. In 1776, he left the Continental Congress to lead in reforming the laws of Virginia, drafting, among other measures, the famous bill for establishing religious freedom. He served as governor of Virginia from 1779 to 1781, retired for two years during his wife's fatal illness, returned to Congress, helped to draft the Northwest Ordinance, and went to France, where, in 1785, he succeeded Benjamin Franklin as American minister. He delighted in French culture and conversed with the Marquis de Lafayette and other enlightened Frenchmen about limiting the despotism of the *ancien regime*. He returned to America in 1789 a warm advocate of Franco-American friendship and in 1790 became secretary of state in George Washington's first cabinet. With James Madison, he soon led the opposition against the Federalist Party and the economic plans of Alexander Hamilton as well as the spread of British influence in American

councils. He resigned in 1793, but during three years of “retirement,” he remained politically active—especially in denouncing John Jay’s treaty with England, intended to prevent war and promote trade. Elected Vice President in 1797, he bitterly opposed the quasi-war with France and the Alien and Sedition Laws, and he wrote the Kentucky Resolutions affirming the right of the states to declare void federal laws they deemed unconstitutional. His election as president in 1801 ended Federalist domination of the federal government. The restriction of the scope of the federal government, the purchase of Louisiana (1803), the failure of reconciliation efforts with England (1807), and the embargo of British goods (1807–08) marked his administrations. He retired to Monticello in 1809, devoting his remaining years to study, farming, a wide correspondence, and the founding of the University of Virginia.

Philosophical Views

Jefferson stands with Franklin as the supreme embodiment of the Enlightenment in the United States. His “immortals” were Francis Bacon, Isaac Newton, and John Locke, each representing a major aspect of his philosophy. He accepted Bacon’s empiricism and emphasis on the role of reason in improving society. From Newton he acquired his view that the universe was harmonious, governed by law, and amenable to human investigation. Locke enunciated the political implications of these viewpoints and was, for Jefferson, the preeminent philosophical guide. The empirical epistemology of *An Essay Concerning Human Understanding* and the insistence on government by consent in the *Second Treatise of Government* undergirded all of Jefferson’s thought. Although he read and admired other philosophers of the Age of Reason, especially the French physiocrats, he remained firmly within the English tradition.

The ideal of a republic of pastoral yeomen colored Jefferson’s vision for the new nation and infused his every word and deed in the 50 years between 1776 and his death. In Jefferson’s context, the word *pastoral* had far more than a merely agricultural or bucolic meaning. It signified, much more importantly, the moral ideals and lifestyle of the long pastoral tradition in Western thought from Aristotle, Cicero, Virgil, and Horace to Addison and the French physiocrats. Its basic concern was to characterize the good

person and his appropriate relations with his environment and other human beings, rather than to focus on public purposes and programs as national leaders often did. Three years after retiring from the presidency, Jefferson expressed an apt analogy in a comment on gardening and its perennial harvest: “No occupation is so delightful to me as the culture of the earth and no culture comparable to that of the garden” (letter from Jefferson to Charles Willson Peale, 1811).

Jefferson wanted a similar pleasure and harmony to infuse all of life. The pastoral setting, although immensely significant, was only instrumental—one admired the shepherd or the farmer or the country gentleman not ultimately for his economic contribution or his aesthetic sensitivity, but for his moral integrity, self-reliance, personal style, and harmonious social life. Although most Americans likely had little knowledge of the Roman pastoralists, and although Jefferson wrote no systematic pastoral treatise, his writings, and the productions of the American press at all levels, everywhere reflected pastoral values. Jefferson’s critical authorial contribution was to weave these values into virtually every law, every letter, every executive message, and every manifesto for the new nation. The persistence and profundity of these values, translated into public policy, raised Jefferson’s political career from the level of mere dexterity to that of grand conception.

Socializing Good Citizens

This sense of the close relationship between personal qualities and the government appropriate for them caused Jefferson to emphasize local government. Vitality at that level was needed to nourish the skills of judgment, the sense of charity, and the concern for public policy inherent in the good person, and to allow those qualities to have their due weight in the public councils. To a pastoralist, government was not grand, elegant, mysterious, or ambitious. It was close to the people, attuned to the needs of their daily lives. The whole was *not* greater than the sum of the parts, as might seem to be the case from Rome or Versailles or St. Petersburg or Constantinople or Peking. In fact, to resist that presumption was a cardinal reason for emphasizing towns, counties, and states rather than nations or empires. Under this conception, a national government might undertake

rather large enterprises—found a national university, construct internal improvements, or even purchase Louisiana, as examples—but only upon impulses coming from the grassroots. Furthermore, the government had to be, in a favorite Jeffersonian word, “mild.” That is, it should not be heavy- or high-handed; its officers were not to be imperious, or arrogant, nor its modes elegant or expensive. Its attitude was to be that of a servant of the people. Thus, when Jefferson said “that government is best which governs least,” he meant primarily that his good citizen had qualities that make lordly bureaucracies and proconsuls not only unnecessary but also actually dangerous. The dictum applied principally to the federal level of government, farthest from the people, presumably less sensitive to their needs and, in the eighteenth century at any rate, least capable of fulfilling legitimate public ends.

In thus defining the nature of government Jefferson did not at all intend to create a laissez-faire, atomistic, survival-of-the-fittest society like that espoused by Social Darwinists a century later. To him, social harmony and the value of human accord were supremely important. Although Jefferson had contempt for many traditional institutions such as the remnants of feudalism, authoritarian churches, secret societies, and military brotherhoods, he was not, in either the Romantic or Darwinian modes, a rugged individualist who idolized Man Standing Alone; rather, Jefferson epitomized Man Organizing. Although the often lonely life of the yeoman farmer might be a vital source of the self-reliance Jefferson so admired, the useful man thus brought into being found his fulfillment *in society*, contributing to the general welfare and discharging the obligations of citizenship—in the rich Aristotelian sense of the word, which was always Jefferson’s context for it.

Educating Good Citizens

The most important social institutions for Jefferson were educational. His concern for the discipline and courses of study for young children, as well as for the reading and learning necessary for the potential leaders of the republic, was incessant and lifelong. Following Locke, Jefferson believed that human beings were liable to almost infinite influence by their experience of life; therefore, if they were to be *good* people, their education

was supremely important. In addition to thus forming virtuous individuals, education would furnish ordinary citizens with the skills they needed to fulfill their responsibilities in self-government and to conduct their own affairs efficiently and prosperously. The education of ordinary citizens was not intended to qualify them to run the government; rather, it would politically enlighten them to the degree that they could choose the best leaders—the “natural aristocrats”—and then hold them accountable for their actions.

Jefferson considered the University of Virginia to be in a way a substitute for a national university that Congress showed little sign of patronizing, despite the urging of every president from Washington to John Quincy Adams. Resting on a system of primary and secondary schools, the University would educate Jefferson’s cherished “aristocracy of talent and virtue” in a way different from the usual modes. Although the ancient languages and other traditional bases of education would be retained, Jefferson wanted modern languages and all the newest fields of science to be taught as equally important branches of knowledge, entirely free from the superstitions, restraints, and degradations long imposed on them. “Everyone knows,” he wrote in 1805, “that Oxford, Cambridge, the Sorbonne, etc., are a century or two behind the sciences of the age” (January 5, 1805, letter to Littleton Waller Tazewell). Finally, the founder of the University of Virginia wanted his future statesmen trained in the theory and practice of republican government. Nothing less than this transforming process, supported by the public from primary school through the university, would sufficiently encourage the virtue, and the changes in character, necessary to make self-government work. In urging the state of Virginia to support the university, Jefferson scorned “the discouraging persuasion that a man is fixed, by a law of his nature, at a given point; that his improvement is a chimera, and the hope delusive of rendering ourselves wiser, happier, or better than our forefathers were” (Report of the Commissioners for the University of Virginia). Rather, it was his faith that knowledge was cumulative over generations. In Jefferson’s thought, more clearly than in that of any other American, the connection is firmly made between Enlightenment aspirations for humankind and the hoped-for character of the new nation. The links were to be schools at every level.

Jefferson also promoted an array of institutions for human enlightenment beyond those properly called schools. He served for nearly 20 years as president of the American Philosophical Society, which he conceived as an American version of the Royal Society or the French Academy, promoting and disseminating scientific and technical discoveries that would improve the life of humankind. He was a founder of the Albemarle Agricultural Society, which he hoped would be a model for such societies spreading useful information for farmers across the countryside. They would also further nourish the skills of self-help and neighborly cooperation that Jefferson incessantly espoused. Although a slave owner himself, he encouraged state and national organizations to abolish slavery, improve life for Native Americans, promote the arts, and stimulate trade. He approved, too, the growth of “rational” religious institutions he hoped would soon replace the bigoted, superstitious churches he thought degraded humankind.

The Occupations of Good Citizens

The third foundation for good character, after vital local government and “improving institutions,” Jefferson placed in one’s occupation. The habits and attitudes inculcated as one pursued daily tasks, Jefferson believed, would have a decisive effect on character. A slave, beaten into submission, never allowed to think for himself, and accustomed to seeing the fruits of his labor enjoyed by others, would be dull, sullen, and irresponsible. A master of slaves would be even more morally reprehensible—he would become overbearing, brutish, arrogant, tyrannical, and dependent on the work of others. Merchants operated under quite different, but morally almost as unpropitious, circumstances. Since they made a living by buying cheap and selling dear, they were exposed to the temptation to secure by fraud and dispose by misrepresentation. To stay in business, they often had to lie and cheat, and even under the best of circumstances, they were in danger of being wiped out by the vagaries of a market beyond their control. Overall, their attention focused predominantly on money. A factory operative, deadened by long hours of labor in damp, filthy places and trained to be an “appendage of a machine,” was also unlikely to become a self-reliant citizen. The mobs that roamed the streets of Rome or London or Paris were entirely unfitted by their habits of idleness, beggary, and theft to be good self-governing citizens. The life of the barracks, the march, and the

battlefield were also bereft of ennobling civic influences for either officers or men in the ranks. Although Jefferson's disdain for these occupations had significant economic foundations, he took his stand against them primarily because they did not sustain the necessary moral qualities and, therefore, did not yield the habits of the good life and of republican citizenship that were Jefferson's *summum bonum*.

Left, of course, was the life of the yeoman farmer, rhapsodized by Jefferson in his famous tribute to husbandmen, "the chosen people of God." They were, he declared, the "peculiar deposit for substantial and genuine virtue, . . . looking to their own soil and industry" for their livelihood. Implicit in the daily round of their lives was a reliance on their own fruitful labor in a healthy environment. On the other hand, Jefferson observed, "Dependence begets subservience and venality, suffocates the germ of virtue, and prepares fit tools for the designs of ambition." These afflictions, Jefferson believed, were far more common in cities than in the countryside. A vibrant republic depends on its grassroots, for "[i]t is the manners and spirit of a people which preserves a republic in vigor. A degeneracy in these is a canker which soon eats to the heart of its laws and constitution" (Jefferson 1784, Query 19).

Jefferson accepted the physiocratic doctrine that only those who labor to produce truly increased the wealth of a nation; his praise of farmers he therefore regarded as economically defensible, and it was politically astute as well in a nation 90 percent composed of farmers and possessed of vast unsettled lands. But it is also evident that he had a primary concern for cultivating the virtues of the good person and the good citizen.

Jefferson's Critics

Despite his iconic status among Americans over two centuries, Jefferson has had his critics. In the election of 1800, pro-Federalist newspapers warned of the dire consequences of an "anarchist" and "atheist" like Jefferson being elected President. Alexander Hamilton regarded Jefferson as naïvely ignorant of the young nation's urgent and continuing need for the national government, aided by a national bank, to stimulate the industrial and commercial growth of the economy. Fellow Virginian slaveowners such

as George Fitzhugh (*Cannibals All!*, 1857) regarded Jefferson as a rabble rouser who had betrayed the cause of his native South and who failed to recognize and appreciate the inherently conservative nature of any healthy society. Small-government anti-Federalists noted that Jefferson's actions in office, notably the Louisiana Purchase, did not always square with his decentralist vision of states' rights and local control. Advocates of racial equality have pointed out the contradiction, which Jefferson shared with other anti-slavery Founders such as George Washington and James Madison, between advocating abolition and continuing to own slaves.

Conclusion

Altogether, Jefferson bespoke a vivid, comprehensive, and revolutionary vision of the nation's character and its future development. He explained what worthy character was, what the distinctive American qualities should be, how these were suited to republican government, what institutions are required, and which occupations are appropriate to the society thus brought into being. Jefferson formed his opinion on constitutional interpretation, foreign policy, civil liberties, political parties, and a host of other questions in terms of their good or bad impact on his vision of the good society.

Jefferson's legacy is perhaps best understood as linked to that of his sometimes friend, sometimes foe Alexander Hamilton. Together, these visionary Founders represent the longstanding polarity of American political thought: small versus big government, popular participation versus elite planning, and rural versus urban virtues. Subsequent thinkers as diverse as Herbert Croly (*The Promise of American Life*, 1909) and Barack Obama (*The Audacity of Hope*, 2006) have sought to combine these contrasting themes into a national synthesis that uses Hamiltonian vigorous government as a means to achieve the Jeffersonian goal of an enlightened and engaged citizenry pursuing the endless opportunities and civic integrity of American life.

Justice

Justice

463

468

Justice

The central meaning of *justice*, as the Oxford English Dictionary notes, is “rendering every man his due,” and being “equitable.” What is distinctive about justice, in contrast to the notion of the morally good, is its focus on respect for the individual and her rights (and sometimes her duties).

Although the notion of the good allows for summing up value across individuals, justice requires that each individual be respected. These are not necessarily in conflict. For example, if A has the choice to save two people, B and C, or one person, D, D may have no right that A save her rather than them. But it is commonly thought that *if* the right and the good do conflict, then justice takes priority. As John Rawls said in the opening of his landmark book, *A Theory of Justice*, “Justice is the first virtue of social institutions, as truth is of systems of thought.” That means that “[e]ach person possesses an inviolability founded on justice that even the welfare of society as a whole cannot override” (Rawls 1971, 3). That said, there are many kinds of justice, and many theories of justice, and both the kinds and the theories are surveyed in this entry.

Kinds of Justice

The first distinction to mark is between procedural justice and substantive justice. Procedural justice concerns the process that is due people before certain major decisions that will seriously affect them are taken. In American legal culture, this is normally referred to by the seemingly

redundant name “procedural due process.” The paradigmatic examples are the protections accorded criminal defendants, such as the right to a jury of one’s peers, the right to counsel, and the right to confront the witnesses against a defendant.

Substantive justice concerns the substantive rights and duties that a person has, such as the right to freedom of speech, or the right a promisee has against a promisor that he or she keep a promise. These are generic rights and duties, and whether a person has a specific right that must be respected, or duty that must be performed, in a particular situation depends on a number of factors. Sorting those factors out is the task of substantive accounts of justice. The remaining discussion in this section will concern itself with those issues. And it will cover the four classic types of substantive justice, as distinguished by Aristotle: justice in rectification, justice in exchange (commutative justice), distributive justice, and political justice.

Rectificatory Justice

Rectificatory justice has two subheads: retributive justice in response to criminal wrongdoing and compensatory justice in response to private law wrongs—torts or breaches of contract.

Retributive justice is based on the thought that when a person has committed a criminal act, he or she deserves to be punished. Strong retributivism holds that a person *should* receive the punishment that he or she deserves, and weak retributivism holds that this person *may* receive the punishment he or she deserves. In either version, a person should receive no more punishment than he or she deserves. How much a person deserves is a function of the severity of the crime and the culpability of the person for having committed it. Empirical research shows that there is general agreement on how to order the severity of crimes and, thus holding culpability constant, how to order the severity of deserved punishments.

Compensatory justice can be conceived under the heading of damages in contract and tort law. The general idea is that the wrongdoer (someone who breaches his or her duty) should make the victim whole. For example, if A

breaches a contract with B, then the expectation measure for damages would require A to give B enough money to put B in the economic position he or she would have been in had A performed his or her part of the contract. Or if A commits a tort against B by, for example, causing personal injury to B, then A would owe B money to compensate for a range of problems, from the cost of medical services, to pain and suffering, to lost earnings.

Commutative Justice

Justice in exchange or commutative justice requires that agreements and exchanges be fair. For example, in the work context, employers must pay fair wages to employees and treat them with respect in the workplace, and employees must do their work conscientiously.

Distributive Justice

Distributive justice concerns the distribution of goods that individuals need to lead good lives. The topic can be divided into four major subtopics: what goods should count when asking whether distributive justice has been achieved; what is the proper measure of a just distribution; by what mechanism should the goods be distributed; and what is the relevant community in which to measure the distribution?

The types of goods that are thought to be relevant for distributive justice include utilitarian measures, such as pleasure, happiness, preference satisfaction, or welfare. They also include what Rawls calls primary goods, namely, those goods, including liberties, that would help a person pursue his or her life plans no matter what they are. And they also include what Amartya Sen calls capabilities, to wit having the opportunity and ability to choose to do, get, or become things that she might value doing, having, or being.

There is a fundamental divide with regard to the proper measure for distributive justice: whether there is some particular distribution that is to be aimed at, or whether the process is all that matters. Robert Nozick famously

argued that if the ownership of property is just at one time, and all transactions from that time forward are just, then whatever distribution results will be just. His target was Rawls, who argued for the “difference principle,” according to which the rules of society should be designed to allow inequalities in goods like income and wealth if and only if those inequalities would benefit the poorest members of society. Nozick’s critique was partly mistaken, insofar as it treated Rawls’s view as if property rights did not depend on process. But it was correct in noting that it would use a particular pattern to design laws so that the expected outcome of free transactions is one in which the worst off are as well off as possible. It is fair to say that most theorists have some pattern in mind in that way. Alternatives to the difference principle include the prioritarian view, according to which the worst off count the most, but their losses can be outweighed by greater gains to others, and the view that after all reach a certain minimal baseline, then the rules should be designed to maximize the average welfare.

Disputes regarding the mechanism to use in achieving distributive justice turn largely on the question of whether the government or private markets should be used to distribute the relevant goods. Certain goods, public goods, cannot be effectively distributed by the market because they are nonrivalrous (one person’s consumption of a good leads to no subtractions from any other individual’s consumption, e.g., national defense) and there is no way to exclude those who have not paid for them from benefiting from them. It is hard to get money in exchange for such goods (public radio and television notwithstanding), and thus, it is hard to have a market for them. But even with regard to goods that the market can effectively produce, the range of ideological views from socialism to free market capitalism covers the spectrum of thought about what sort of role government should have in their production and distribution, from state ownership of the means of production, to regulation of the market, to minimal protection for property rights.

The question of the relevant community concerns who is counted when looking to see whether distributive justice has been achieved. At one end of the spectrum are cosmopolitan thinkers who argue that *all* humans have to be taken into account. One step less inclusive are thinkers like Rawls, who

ask whether members of a particular society (i.e., a group of people organized under one government) have achieved distributive justice. Some federalists will want to allow the question to be made more local still, focusing to some degree on smaller governmental units, like states in the United States, or different countries within the European Union.

One last issue that arises in the context of discussions on distributive justice is whether the accounts should be two level or one level. A two-level account asks how laws should be designed so as to achieve distributive justice, but it does not require individuals to do anything other than support and obey just laws. A one-level account demands that individuals think about how their private choices will affect the distribution of the relevant goods.

Political Justice

The last of Aristotle's four types of justice is political justice. This area can be divided into contributive justice, dealing with what individuals owe to the society in which they live, and justice in ruling, dealing with what rulers owe to the society they govern.

Starting with contributive justice, there are three obvious things that citizens, or even residents, arguably owe the country in which they live: taxes, labor, and general obedience to the law. Taxes are obviously connected with the previous topic of distributive justice. The government needs to tax people to pay for its services and to redistribute wealth that might need to be redistributed. Labor takes two interesting forms. Arguably, if the state needs people to provide certain services for it to survive or flourish, services such as time in the military or jury duty, then people can be obliged to provide such services. Additionally, people arguably owe the state a form of civic engagement, that which is necessary to support the institutions that must exist for a just state to continue to exist over time. Lastly, it can be argued that people owe the law respect (i.e., obedience), even if they disagree with it, if it is at least close enough to just and was made in a procedurally legitimate way.

Justice in ruling connects with the last point; it is a precondition of the law's legitimacy and the duty of the people to obey it. This topic too allows for a division into two subtopics: the proper aim of the government, and the proper form of the government. Classically, the main concern of political theorists was to emphasize that rulers had a duty to aim at serving the common good, as opposed to their personal gain. By the time of John Locke (around 1690), this idea was refined to include respecting the rights of the individual. That notion was adopted in the U.S. Declaration of Independence, which held as "self-evident, that all men . . . [have] certain unalienable Rights," and that governments are instituted "to secure these rights."

As for the form of government, the classical options for sound government were monarchy, aristocracy, and democracy. Today, there is near universal agreement that democracy is required for legitimate governance. As Article 21 of the Universal Declaration of Human Rights states, "Everyone has the right to take part in the government of his country, directly or through freely chosen representatives." Many countries in the world do not respect this right in practice, but few are willing to flout it openly. What is more contested is the proper role of a judiciary to check the power of the democratically elected representatives by reference to some form of more or less hard-to-amend higher (constitutional) law.

Historically Significant Theories of Justice

Theories of justice can be divided into four broad types: virtue-based, natural law, contractarian, and utilitarian. The original Western theories, formulated by Plato and Aristotle, were virtue based. As Plato points out near the beginning of the *Republic*, justice cannot be as simple as giving each person what he is owed, for that would seem to imply that it would be just to return a sword to his owner even when he is in a blind rage. To do better, he suggests that justice is what results, in both a city and a person, when each are ruled by reason. This is ultimately a fairly hollow account because one needs to know what reason requires. Aristotle tries to develop the account further by discussing the idea of equity: giving equal to equals and giving differently to those who are unequal. He tries to use that idea across the various types of justice described above.

Natural law theories also appeal to reason, but they are distinguished by the thought that reason allows one to reach certain clear conclusions that can be expressed in law-like form. Thomas Hobbes and John Locke both, in different ways, appeal to a natural law idea for justice. Hobbes says that justice is keeping promises as long as others will too. Locke thinks that justice is respecting the natural rights to life, liberty, and property. Both use social contract arguments to justify the existence of the state. But the nature of justice, both think, can be articulated independently of the state.

Social contract theories look to the idea of a social contract to determine the content of justice. Immanuel Kant, following Jean-Jacques Rousseau, formulated a theory of right according to which the framing of law (or a general will) under which all can be free is the creation of justice. Rawls follows in that tradition by appealing to the idea of a hypothetical social contract, in which contracting parties design the rules of society behind a veil of ignorance, and thereby, they determine what justice as fairness would require. Deliberative democrats also follow in that tradition, broadly understood, by seeking to provide fair conditions for democratic debate, and letting the debate itself determine what is just.

Lastly, utilitarian theories use the measure of promoting the general happiness or welfare of humanity to set the content of justice. David Hume framed this idea by arguing that justice is adopted only because it is useful in a world of scarcity and competition. And John Stuart Mill followed up by arguing that the rules of justice should be shaped to promote human happiness.

Kant, Immanuel

Kant's philosophy covers almost every subject. He wrote on metaphysics, natural science, anthropology, morals, aesthetics, history, theology, and politics, to mention the most important. His ambition was not only to have something original to say but also to do so in a systematic manner. In his view, the task of philosophy is to examine critically, ground, and connect theories from the other scientific fields. However, Kant's aim is not primarily theoretical. The ultimate end of philosophy is to clarify what kind of life we should pursue as humans, citizens, and inhabitants of the same world. Hence, political philosophy plays a crucial role in his system. Nevertheless, writings explicitly devoted to this field appear relatively late. One reason is that the search for the fundamental principles of his system took Kant far more time than he had imagined. Another reason is the hierarchical nature of his approach. Political philosophy depended on getting other and more fundamental parts of the system in place.

Life and Early Works

Immanuel Kant was born on April 22, 1724 in Königsberg (now Kaliningrad in Russia), the capital of East Prussia. Apart from the period 1748–56, when he worked as a private teacher in some nearby towns, he never left Königsberg, dying in his hometown on February 12, 1804. Because the city was an important trading port and the home to a number of nationalities, Kant believed that life in Königsberg provided him with an

understanding of human nature and culture that was far from provincial. In fact, he saw himself as a cosmopolitan, a perspective that was to become important in his political philosophy.

Immanuel was the fourth child of Anna Regina and Johann Georg Kant, but only a sister, five years older, had survived early childhood. Johann Georg was a harness maker. The guild was low in rank, and it was not a lucrative business. Nevertheless, Kant always emphasized that his family had never been dependent on anyone and that they had lacked nothing.

Immanuel's parents belonged to the Pietist movement, which was anti-intellectual and embraced mystical elements of personal experience of conversion. In a sense, Pietism was also anti-authoritarian, as it urged independent Bible study rather than strict adherence to the teachings of trained theologians. Still, it demanded obedience to God's commands. Kant had an ambiguous attitude to Pietism. On the one hand, in his parents and many of their friends, he found virtues every human being should strive for: honesty, decency, and inner peace. On the other hand, he was highly critical of the movement's appeal to mystical experiences and its tendency to promote self-condemnation and mechanical obedience. Although Immanuel did not experience any of these elements of Pietism at home, irrational and mystical tendencies were widespread. Moreover, the authoritarian dimension of Pietism permeated the Collegium Friedricianum, his school in the period 1732–40.

The Friedricianum was strongly Pietistic, and almost all subjects were taught with a view to religion, which Kant strongly disliked. In Kant's view, the Friedricianum turned its pupils into servile, uncritical, and hypocritical human beings. In his moral and political writings, Kant would later argue that a proper understanding of ethical principles supports quite opposite virtues: autonomy, critical reflection, and honesty. He also supported the alternative pedagogical movement of Johann Bernard Basedow, which argued for the importance of combining teaching with play and pleasure. This position accorded with Kant's own views that proper education and upbringing should promote the child's sense of self-worth and confidence in addition to duty.

Although Kant disliked the Friedricianum, he got a solid education in theology and languages (Latin, Greek, and Hebrew) and, to some extent, in mathematics and philosophy. In September 1740, he was enrolled at the University of Königsberg. A prudent choice would have been to study theology, which would have given him a steady income as a pastor or even as a professor of theology. The Friedricianum had prepared him well for such a future. Kant chose to study at the philosophical faculty instead. During his student years, he earned his living as a tutor, taking no loans and accepting no stipends, for he regarded being independent as a virtue. Ironically, at the time, the theological faculty exerted heavy control over the philosophy faculty. It regulated its curriculum and denied promotion to lecturers who were not Pietists. Toward the end of his life, Kant wrote a work on university politics, *The Conflict of the Faculties* (1798), in which he argues that it is in the interest of the state to make philosophy the highest faculty. Only this faculty is in the service of truth, and only truth can protect the state against the shortsighted and selfish tendencies of human nature.

As a student of the Faculty of Philosophy, Kant took courses not only in logic, metaphysics, and ethics but also in mathematics and physics. He took great interest in natural science, or “natural philosophy” as it was called at the time, a subject not taught at the Friedricianum. His first five works were in this field, and another six appeared in the period 1756–58. In 1744, he began to work on *Thoughts on the True Estimation of Living Forces*. A thesis delivered at the University would have to be in Latin. Kant wrote in German. He had greater ambitions than a university degree and hoped that *Living Forces* would provide the solution to a longstanding debate between Cartesians and Leibnizians on the proper measurement of force.

Kant’s mother had died when he was 13. In 1745, his father became ill, and Kant left the university to take care of the family. In 1748, two years after his father’s death, Kant took a post as a private teacher outside of Königsberg. He was well treated by the three wealthy families he worked for. He became a close friend of one of them and was a frequent guest in the nobleman’s home.

Living Forces did not bring Kant the fame he had hoped for. He had to return to the university and acquire the rights to serve as a lecturer. By

1756, he had fulfilled all the requirements for a professorship, but there was no position available. Instead, he had to work as a private lecturer and receive money from the students. Kant soon became a popular teacher and could lead quite a comfortable life despite a heavy teaching burden. He often lectured 24 hours a week and covered such different subjects as mathematics, physics, ethics, logic, geography, and metaphysics.

In the period 1758–62 during the Seven Years War, the Russians occupied Königsberg. In many ways it was a time of prospering for the city, and for Kant himself. The Pietists lost much of their power, and Königsberg grew livelier and more cosmopolitan. Kant was a popular guest at dinner parties, where he would discuss German, French, and English literature, as well as fashion and recipes. Kant's ideal was clearly to become a well-rounded human being. Although at the time his written work centered on natural philosophy, in his teaching, he drew attention to aesthetic, moral, and political dimensions of life.

Life and Works 1762–81

In the 1750s, Kant's works focused primarily on questions related to natural science. In the next decade, his writings became more devoted to moral and theological issues, with a more skeptical attitude toward the role of reason. Kant became convinced that the proper end of all inquiry is to understand "the vocation of man." In other words, traditional metaphysics, with its attempts to establish truths about God, afterlife, ultimate forces, and constituents of the universe, had misunderstood its role. In addition, its alleged proofs were spurious. This is the message of works like *The False Subtlety of the Four Syllogistic Figures* (1762), *The Only Possible Basis for a Demonstration of the Existence of God* (1763), and *Dreams of a Spirit-Seer elucidated by Dreams of Metaphysics* (1766).

In 1758, Kant had unsuccessfully applied for a professorship in metaphysics and logic at the University of Königsberg. He continued to have a heavy teaching burden, remaining socially active and participating in reading circles many evenings a week, where learned and lay alike exchanged ideas. In 1769, he was offered a position in Erlangen, but he declined because he did not want to leave Königsberg. In 1770, he was finally appointed

professor of metaphysics and logic in Königsberg, defending his dissertation in Latin: *On the Form and Principles of the Intelligible and Sensible World*. From the point of view of moral and political philosophy, the main import of this work was its break with the sentimentalist position that Kant had supported the decade before. Now Kant held that moral principles can be sought only by the intellect. Without such principles, feelings confuse rather than guide our judgments. In his later moral and political writings, he remains faithful to this view.

Kant soon told a friend that he was working on a short book to elaborate the views of the dissertation, with an addition on moral philosophy. A year later, this project had been reframed to focus on the limits of human sensibility and reason. It took him another 10 years until the *Critique of Pure Reason* was ready for publication, in 1781.

Works 1781–86

The *Critique of Pure Reason* is Kant's most famous work. Since it lays down the foundations for all other philosophizing, it is arguably also the most important. Still, from the point of view of moral and political philosophy, it hardly does more than lay some bricks for such a foundation. In the *Critique of Pure Reason*, Kant argues that it is in principle impossible to *know* whether God in fact exists. Therefore, moral and political philosophy must have a secular basis. Kant also argues that although we can never *know* that we are in fact free, we are still entitled to *think* that we are free. This is a crucial step for moral and political philosophy as Kant sees it. For only an action that can be imputed to someone in the sense that it is seen to spring from that very person's free will can it reasonably be subject to moral blame and praise. Moreover, it is only free beings that can ground a civil society because as we shall see, such a society must be conceived of as if arising through a contract among free individuals.

How *ought* we to act, and what kind of society should we strive for? These are the fundamental questions of moral and political philosophy. In his work of 1785, *Groundwork of a Metaphysics of Morals*, Kant lays the foundation for answering them. Here he argues that the supreme law of morality takes the form of a categorical imperative that says: "Act only

according to that maxim whereby you can at the same time will that it should become a universal law” (*Groundwork*, Academy Edition [AK] 4: 421/39). A maxim is a rule you decide to live by, and the categorical imperative commands you to choose only such rules that you could will everyone else to choose as well.

Kant also presents other formulations of the categorical imperative. The most important is the command never to treat human beings as a mere means but always also as ends in themselves. However, none of the formulations suffice for moral philosophy proper or for political philosophy. To know how we should act and which laws a society should be based on, we need to move to another level of inquiry. Nevertheless, Kant’s next work in practical philosophy, *Critique of Practical Reason* (1788), does not make this move. Just like the *Groundwork*, its main theme is the relationship between freedom and the categorical imperative. And like the *Groundwork*, it emphasizes the unsuitability of feelings as a source for moral principles.

Both the *Groundwork* and the *Critique of Practical Reason* have given readers the impression that in general Kant is suspicious of or even hostile to human emotions. However, the recognition that in these works Kant is preoccupied with the question of the foundations of morality rather than with the whole range of questions relating to human conduct makes his many critical remarks about feelings at least somewhat more understandable. In Kant’s view, feelings are far too whimsical to yield principles that are supposed to be morally binding for everyone.

Kant’s Political Philosophy

Just after he had finished the *Groundwork*, Kant wrote two essays with an explicitly political content. In “Ideas for a Universal History from a Cosmopolitan Point of View” (1784), he argues that the final end of human progress is the state in which our capacity for freedom is maximally realized. A crucial step toward this end is the forming of a civil society. Without such a society, humans would exist in a so-called state of nature where there are no laws and no legitimate power. The idea of such a state of nature had first been presented by Thomas Hobbes (1651) and later modified in different ways by John Locke (1679) and Jean Jacques

Rousseau (1762). Kant offers his own twist: Humans are naturally torn between egocentricity on the one hand and a yearning for respect from others on the other. This tension needs to be resolved, but within the state of nature, it cannot. Hence, humankind is driven to form a civil society. In this way, the rights of each individual become regulated, and everyone is secured a minimum amount of freedom to pursue their interests without depending on the respect or kindness of others. From this stage, however, the society must move onward toward a just civil constitution, a move Kant believes is extremely hard to make because of the “crooked wood out of which man is made.” By extending his line of reasoning from individuals to states, Kant concludes that the end of human progress can be realized only in a community of states under a world government. Without such a world order, the states will engage in endless wars, and the freedom of their citizens will be seriously hampered.

That same year (1784) Kant also wrote “What is Enlightenment?” His answer is that Enlightenment is the stage in history when humankind can think for itself without tutelage. Although Kant’s own age was not yet fully enlightened, it was nevertheless an age in which the first steps toward Enlightenment could be made. Politically speaking, the required step is to secure the freedom to make “public use of one’s reason”; that is, the freedom of a scholar to present his views before “the whole world of readers.” Still, Kant thought that “the private use of reason”—in other words, the use of reason *within* a civil post—should be restricted. A priest or a lawyer should not be free to criticize the doctrines on which his office is based.

The later *Conflict of the Faculties* (1798) confirms the distinction between the public and the private use of reason. It is also itself a manifestation of Kant’s public use of his reason against the constitution of the university. Even before that work, Kant had challenged the authorities. His philosophical reinterpretation of the Bible in *Religion Within the Bounds of Mere Reason* (1793) and his clever avoidance of the censors in Berlin almost cost him his job. In 1794, he had to promise the king, Fredrick Wilhelm II, to “refrain from discoursing publicly, in lectures or writings, on religion, whether natural or revealed” (AK 11: 527, letter 642). Kant kept his promise as long as the king was alive.

In 1793, Kant published an essay called “On the Old Saying: ‘That May Be Right in Theory but It Won’t Work in Practice.’” In addition to addressing the question of the relationship between theory and practice in the moral sphere, Kant extends the question to the legal sphere: Why should we obey existing governments, and are there any circumstances that allow us to make an exception? Although he had talked enthusiastically about the French Revolution (1789), even at dinner parties with noblemen, his official answer is that however unjust the laws may be, no citizen has the right to disobey or rebel. The reason is that there can be no other rightful power than that of a government. As Hobbes had argued, when the people take the power into their own hands, they in effect leave the civil society and return to the state of nature. Therefore, the only legitimate means at one’s disposal within the civil society is to criticize the government in public.

By the standards of his time, Kant had become an old man, and the power of his intellect was diminishing. But there was still work to be done, not the least in political philosophy. *Toward Perpetual Peace* appeared in 1795. Here Kant no longer argues for a world state since this is incompatible with the freedom of each state. Instead, he argues that lasting peace requires a federation of free states whose only task is to protect the freedom of each state from being harmed by wars. Although his understanding of cosmopolitanism has changed, cosmopolitanism still plays an important role. Every human being is born on the same spherical Earth, which originally belongs to all of us. As citizens of the world, we therefore have a special right to hospitality, that is, the right to travel freely between states and to be treated without hostility. This right does not mean that one can make claims to permanent residence and work, but one is at least entitled to visit other states and to offer to engage in commerce. Kant believed that such interaction between different peoples would enhance the process toward perpetual peace since it ensures that “the violation of right on one place of the earth is felt in all.” (*Perpetual Peace*, AK 8:360)

In 1797, Kant finished *The Metaphysical Foundations of the Doctrine of Right* and published it the same year together with *The Metaphysical Foundations of the Doctrine of Virtue*, in a book called *The Metaphysics of Morals*. This is his last significant work. Later works are either

compilations of earlier writings or lectures. When he died, he also left behind a large quantity of unfinished notes.

The topic of the *Doctrine of Right* is the rights and duties that pertain to persons and states. According to Kant, there is only one innate right that belongs to every person, namely, the right to freedom “in so far as it can coexist with everyone’s freedom in accordance with a universal law” (*Metaphysics of Morals*, AK 6:230). The affinity between this understanding of right and the categorical imperative is obvious. Still, there is an important difference between a right and a morally good action. For Kant, actions are *morally good* only if they are performed on the basis of a freely adopted moral intention. When it comes to the question of *right*, the intention is no longer at issue because a right puts other people under obligation. It gives rise to duties that others can be coerced to perform, and clearly one cannot be coerced to adopt *freely* an intention. This line of reasoning also explains why the principle of right concerns only *external* freedom; in other words, our freedom to act. The categorical imperative, on the other hand, is a principle for our *inner* freedom, that is, our freedom to will or intend.

In earlier works, Kant had claimed that the civil state is an inevitable result of certain tensions in human nature. In the *Doctrine of Right*, his argument changes: in accordance with Hobbes, Kant argues that every person has a natural right to property, but without a civil society, there would in fact be no difference between proper ownership and mere physical possession. I could physically hold something in my possession, for example by clinging to it, but my claims to ownership would lack the required support. There would be no laws to appeal to and no coercive power to call on if others took my property away from me. To ensure our natural right to ownership, we therefore have a duty to leave the state of nature and enter into a civil society. Kant thinks of the civil society *as if* arising through an original contract of free persons. This “original act” expresses the universal will of the people and therefore justifies the authority of the state. The idea of the original contract also sets limits to the legislative powers by ruling out laws that “a whole people could not possibly give its consent to.” As an example of what one could not consent to, Kant mentions hereditary privileges. He also argues, like Locke, that the civil society should be a republic wherein

the legislative, executive, and judicial functions are maintained by different authorities. Only thus can propensities to tyranny be curbed.

In accordance with Locke, Kant argues that the right to a piece of land or an object is a private property right that one can acquire also in the state of nature. Kant also discusses other private rights such as rights against persons acquired through contracts, and the rights that pertain to children and parents. Within a civil society, these rights are sanctioned by public laws, which belong to the sphere of public right, i.e., right overseen by the state. Kant extends the discussion of public right to rights that obtain between states. In the spirit of *Perpetual Peace*, he claims: “Only in a universal association of states can rights come to hold conclusively and a true condition of peace come about” (*Metaphysics of Morals*, AK 6:350). However, he now sees this hope as an ideal that can never be fully realized. Still, the cosmopolitan right to travel and to offer to engage in commerce might help our continual striving toward it.

In Kant’s view, the duty of the state is to secure the right of freedom of its citizens to the extent that the “free choice of each must accord with the freedom of all” (*Metaphysics of Morals*, AK 6:263). As Hobbes had suggested, the state should also ensure that those who are unable to care for themselves receive help. But the state has no obligation to make its citizens comfortable or happy. In fact the state’s right to claim taxes and to punish those who do not obey might well make people angry and frustrated. When it comes to human rights, contemporary readers may find Kant’s political philosophy somewhat disappointing. He acknowledges the innate right to freedom and equality, and the right to express oneself, but has little to say about such important rights as right to life and health. In light of his emphasis on the dignity and worth of every human being, his claim that women should not have the right to vote is surprising and indeed offensive. Another aspect of Kant’s political philosophy that tends to upset contemporary readers is his adherence to retributive justice or the principle “an eye for an eye.” Whether on these issues Kant was simply a victim of the prejudices of his time, or harbored deeper philosophical reasons for his views, is still a matter of debate.

Although Kant's moral and political writings are sometimes difficult to understand and contain elements that seem indefensible to a modern reader, they have been an important source of inspiration for a number of later thinkers such as Hannah Arendt, Robert Nozick, John Rawls, and Jürgen Habermas. It is also fair to say that Kant's understanding of human beings as ends in themselves has made an invaluable contribution to our modern conception of human worth and human rights.

473

Kautsky, Karl

Karl Kautsky (1854–1938) was the leading theoretician of Marxism from Friedrich Engels's death in 1895 to the outbreak of World War I. His close association with Engels and passing acquaintance with Karl Marx gave his work the stamp of legitimacy. More importantly, his early work about Marx's theories and interpretation of history—*The Economic Doctrines of Karl Marx* (1887)—spread the word throughout the world, was translated into scores of languages, and was credited by both Lenin and Mao, among many others, with introducing them to Marxism. But above all else, his prominence derived from his intimate association with the German Social Democratic Party (*Sozialdemokratische Partei Deutschland*, SPD), for decades the world's largest avowedly Marxian worker party. He was a major architect of the SPD's Erfurt program (1891), which established the Marxian nature of the party, and his exegesis of this program (*The Erfurt Program*, 1892) was even more widely translated and distributed than his earlier work. Kautsky's influence in the SPD was mainly a product of his close affiliation with August Bebel, the longtime party leader and Reichstag representative. Finally, his international influence and reputation were further enhanced by his many decades as editor of *Die neue Zeit*, the preeminent journal of Marxism in the years before 1914, and the literally hundreds of articles and books in which he applied Marxian analysis to contemporary and historical subjects.

Although he always insisted that the workers' movement was necessarily a political movement, he himself was no politician; that is, he was never a

party officer nor a candidate in Reichstag elections. He was often not even a delegate to the party's congresses except *ex officio* as editor of *Die neue Zeit*, and he usually did not participate in the heated debates the congresses produced. Nonetheless, at the frequent urging of Bebel, Kautsky took public stands on political issues that affected the party.

Up to 1905, most of his polemics were aimed at the party's right wing—primarily south Germans and trade unionists, who had significant theoretical support from Eduard Bernstein, the founder of revisionism. This faction held, as Bernstein put it, that “the end is nothing, the movement everything”; that is, piecemeal gains in wages, organization, worker protection, and so on were more important than revolution and the seizure of political power by the proletariat. Kautsky argued that while these things were necessary, the end goal of political power should not be subordinated to them and, in fact, that the party was superior to the rank-and-file movement as mentor and guide. After the 1905 Russian Revolution, a much more vigorous left-wing party faction, headed by Rosa Luxemburg and Karl Liebknecht, began to agitate for a more aggressive posture for the party. Against the left, Kautsky emphasized the recklessness of confronting the state prematurely; he was especially concerned that the “mass strike,” a tactic that gained considerable backing after 1905, would be destructive to the movement if undertaken before the time was ripe.

Thus, Kautsky's political position was centrist, emphasizing the necessity of the movement and its demands for more benefits and political influence for the workers but also cautioning against risking all when the state was still very strong. The perplexing characterization of the SPD as a “revolutionary, but not a revolution-making” party was what Kautsky offered as an alternative to the right's abandonment of revolution and the left's eagerness to force the revolution by violent action. Such a middle-of-the-road position did not long survive the tremendous disruption brought on by the war in 1914–18, and then the revolutions in Russia in 1917 and Germany in 1918. In the case of the war, the workers proved themselves, at the beginning, to be far from the ardent internationalists Marxists had hoped they would be. As for the two revolutions, the extremism of the revolutionary situation put a stop to centrism of any sort—in Russia, the chaos and destruction of the war brought the most extreme element to power, and in Germany, the

nationalism and fear of greater chaos ensured, in the short run, the emergence of the most conservative segment of the SPD. Kautsky's position lost everywhere.

Kautsky's influence declined rapidly during the war, and his influence and reputation faded further after 1918. In that year, he wrote an attack on the Bolsheviks to which Lenin responded with *The Proletarian Revolution and the Renegade Kautsky*. The substance of Lenin's counterattack was that Kautsky had *always* misread Marx and that under his theoretical leadership the proletariat had been led into a quagmire from which it could be freed only by a determined and united revolutionary party. Born in Prague, then part of the Austrian empire, Kautsky died in Amsterdam fleeing the Nazis.

474

Keynes, John Maynard

John Maynard Keynes was an important participant in the creation of modern economic policy, by virtue of his practical work in the Treasury during both World War I and World War II, and through his advocacy of a new international economic order in the early 1940s, culminating in the Bretton Woods Agreement of July 1944. Bretton Woods laid the foundations for the postwar international economy, creating a system of international economic management, a series of fixed exchange rates tied to the U.S. dollar, and two new institutions, the International Monetary Fund and the World Bank (initially known as the International Bank for Reconstruction and Development). No agreement could be reached in the mid-1940s on the structure of the third component of this new order, the World Trade Organization, which was eventually formed only in 1995.

Keynes is (rightly) known for his authorship of the *General Theory of Employment, Interest and Money* (1936), a path-breaking work generally agreed to be the founding moment of modern macroeconomics, and (wrongly) as the originator of “Keynesianism,” a conception of the relation of government and economy in which the former seeks to steer the latter along a consistent growth path. Keynes died in 1946, shortly after renegotiating the American loan that regularized Britain’s postwar financial dependence on the United States, although most of the loan was squandered in just over a month during the summer of 1947 defending sterling at the rate of \$4.03 to £1, convertibility at this rate having been made a condition of the loan by the U.S. government. Convertibility was first suspended in

August 1947 and the conversion rate then subsequently pegged in 1949 at a defensible \$2.80.

Keynes was born on June 5, 1883, at 6 Harvey Road, Cambridge, the first child of John Neville and Florence Keynes. His lifelong connection with Cambridge University ran through his father, who as a University Lecturer in Moral Sciences and later Registrar (or Registry, as the position is known at Cambridge) played an important part in the modernization of the University from the 1890s to the 1930s. Educated first at Eton and then at King's College, Cambridge, Keynes graduated twelfth in the ranking of 1905 mathematics firsts. That autumn he attended Alfred Marshall's lectures on economics, and he received weekly supervisions from Arthur Cecil Pigou, Marshall's chosen successor in the Cambridge chair. In 1906, he took the Civil Service examination, came in second, and was consequently assigned to the India Office. When in 1908 Pigou became Professor, he funded two lectureships in economics out of his own pocket, and the University gave one of these to Keynes. He was elected a Fellow of King's in 1910 and from 1912 served as editor of the *Economic Journal*, which provided him with an education in contemporary economic thinking.

Initially Keynes's chief interest as an economist was monetary theory, filling out Alfred Marshall's treatment in his lectures but not venturing beyond it. His first book, *Indian Currency and Finance*, was published in 1913, but this academic interest quickly turned practical with the outbreak of war in 1914. In January 1915, he joined the Treasury for the duration of the war, closely involved with the increasingly difficult issues of war finance. This led to his place on the British delegation at the Paris Peace Conference, where his chief task was the determination of the war reparations to be demanded of Germany. Already disenchanted with the French and other allies in the later phases of the war, his disillusion with the terms of the Treaty of Versailles was condensed in *The Economic Consequences of the Peace* (1919), demonstrating *inter alia* that if Germany were to "pay" for the war, then the rest of the world had a strong interest in the reconstruction of German industry and the revival of international trade. This book made Keynes famous and inaugurated a long and successful career of economic journalism. He resigned his University

Lectureship in 1920, but his active connection with Cambridge, its students, and its economists continued through his King's Fellowship.

During the 1920s, Keynes built a private fortune through speculation and wrote extensively about domestic economic policy—*A Tract on Monetary Reform* (1923), *The Economic Consequences of Mr. Churchill* (1925), and *Can Lloyd George Do It?* (1929). In 1930, he published *A Treatise on Money*, introducing new arguments about monetary policy and economic activity but soon began revising his arguments into those of the *General Theory*. A central contention of this book is that economic equilibrium does not necessarily imply full employment and maximum output and that monetary policy can play a role in securing full employment. Fiscal arguments were added to this in his important *How to Pay for the War* (1940), and the subsequent elaboration of Keynes's ideas by his English and American followers laid almost exclusive emphasis on the role of fiscal policy in postwar economic management.

Khomeini, Ayatollah

Khomeini, Ayatollah

474

475

Khomeini, Ayatollah

Ayatollah Ruhollah Khomeini (1902–89), was the former supreme leader (1979–89) of the Islamic Republic of Iran. Although many aspects of his thought are ancient, stretching back to the founding of Islam and the internal schism that led to the creation of the Shia branch of the religion, it can only be fully understood in the context, and as a product, of events in the twentieth century.

There has never been a sharp separation between church and state in the Islamic world, at least in a manner similar to the Western republican tradition. However, neither has there been a comprehensive Islamic theory of the state or political rule. It is true that Shia Islam has always possessed a certain inherent political character (considering that it was born from a dispute over who should rule the *ummah* after Muhammad's death), but until the early 1900s, the Shia *ulama* seemed content to allow secular governments to rule as long as the community was not prevented from practicing its faith. This all changed dramatically in the mid-twentieth century, specifically in Iran.

In the 1950s, the Shah Mohammad Reza Pahlavi began implementing a series of policies and programs aimed at rapidly modernizing and secularizing the country. Although many events precipitated the revolution of 1979, most notably the Central Intelligence Agency (CIA)–backed *coup d'état* against the nationalist prime minister Mohammed Mossadegh in 1953, the most prevalent ideological concern that fueled anti-Shah

resentment was the perception that his policies constituted an attempt to erase Iranian culture, religion, and sovereignty and replace them with Western cultural values, atheism, and dependence on the United States and other Western countries. This effacing of traditional Iranian culture was known as *gharbzadegi* or “westoxification.” It is in this respect that Khomeinism is clearly a product of modernity as much as it is an expression of premodern times.

The most fundamental idea that informed Khomeini’s thought is that humans are spiritually weak and morally fallible. To correct for these failings, Khomeini argued that society should be governed by laws created not by humans but by those revealed by God. Therefore, those who were most knowledgeable of the Law (*Shari’a*)—the *mujtahids* or *ulama*—should rule. It should be noted that this position delegitimized democracy as a political system because in democracies governance is invested in the people, and the same people are entrusted with choosing their representatives. Betraying Islam’s Platonic influences, it was posited by Khomeini that proper moral education and just laws, modeled on the “Golden Era” of Muhammad’s time, would lead to a just society. This was the basis for Khomeini’s *valayat-e-faqih*, or rule by religious jurists—a comprehensive and in many ways modern form of government (in that all the trappings of a modern nation-state had to be incorporated into what was, otherwise, a very anti-modern ideology).

The basic structure of the contemporary Iranian government is divided into four branches: (1) the Supreme Leader, (2) the Guardian Council, (3) the Council of Experts, and (4) the Judiciary. In addition to these four institutions, an elected parliament—the *majlis*—operates as a legislature, but policies proposed by this body can be arbitrarily vetoed by the Guardian Council, and the Council also reserves the power to choose which candidates are acceptable for running in elections

Immediately after the Revolution, Khomeini instituted social policies consistent with Islamic ethical principles. For example, the Qur’anic imperative to dress modestly was translated into laws requiring that women who have attained puberty wear the hijab. As part of the anti-westoxification movement, Western styles of clothes were largely banned,

along with cosmetics, literature, cinema, and other cultural products. Limiting access to certain consumer goods and the censorship of media was justified by the argument that Western consumer culture leads to excessive behavior, materialism, conspicuous consumption, and envy between neighbors, all highly discouraged by the Qur'an and the *Hadith*. Finally, consistent with the Islamic principle that all secular ideologies—liberalism, socialism, and particularly nationalism—divide the Muslim community, Khomeinism was premised on the idea that the *ummah* should be united in a single community. Therefore, revolutionary Iran avowedly attempted to export the Revolution to other Muslim countries, most notably through their financial support for Shia groups like Hezbollah in Lebanon.

The lasting impact of Khomeinist ideology has been profound. Political and militant Islamic groups around the world have been inspired and emboldened by the successful revolution in Iran, and they see the Islamic Republic as a viable model of government to replace what are perceived as corrupt regimes, and to resist the encroachment of Western power and culture in Muslim societies. Contemporary Iran still stands at the epicenter of what some, like Samuel Huntington, believe is a civilizational clash between the Islamic and the Western world. Others understand the conflict as symptomatic of unjust power relations in a globalized world.

477

King, Martin Luther, Jr.

Reverend Dr. Martin Luther King Jr. (1929–68) was the most distinguished American civil rights leader of the twentieth century. In 1955, at the age of 26, he began his civil rights career by leading the successful Montgomery (Alabama) bus boycott to gain equal access to city buses for black citizens. King led the successful Civil Rights Movement of the 1950s and 1960s. His leadership resulted in the successful passage of the Civil Rights Bill of 1964 and the Voting Rights Act of 1965. He is the first and only black American to have a U.S. national holiday named after him and the only nonpresident to have a memorial on the National Mall in Washington, D.C.

King attended segregated public schools in Atlanta, Georgia, graduating from high school at the age of 15. In 1948, at age 19, he received a B. A. degree in sociology from Morehouse College, the distinguished black college in Atlanta from which both his father and grandfather had graduated. He enrolled in Crozer Theological Seminary in Pennsylvania, where he was elected president of a largely white senior class and was class valedictorian. At 22, he received a Bachelor of Divinity degree. He completed a Doctor of Theology degree at Boston University in 1955. While in Boston, he met and married Coretta Scott, a gifted student from Marion, Alabama, who was studying at the New England Conservatory of Music. They had two sons and two daughters: Yolanda Denise, Martin Luther III, Dexter Scott, and Bernice Albertine.

In 1954, he became pastor of the Dexter Avenue Baptist Church in Montgomery, Alabama. Although Dr. King was already active in civil rights, serving on the Executive Committee of the National Association for the Advancement of Colored People, it was in Montgomery in 1955 that his civil rights leadership took a historic turn. He was asked to lead the Montgomery bus boycott, which lasted 381 days, until December 20, 1956. (On December 21, 1956, the U.S. Supreme Court declared the laws requiring segregation on buses to be unconstitutional.) During this boycott, King was arrested, his home was bombed, and he was subjected to personal abuse and deadly threats; yet he emerged as the leader of the U.S. Civil Rights Movement.

King took his civil rights ideals from his theological studies as well as from the teachings of Gandhi. While studying theology at Crozer, King heard a lecture on Mahatma Gandhi and the nonviolent civil disobedience campaign that had been used successfully against British imperial rule in India. King was particularly struck by Gandhi's words: "Through our pain we will make them see their injustice." King was also influenced by Henry David Thoreau's theories on how to use nonviolent resistance to achieve social change. King applied these techniques during the successful Montgomery bus boycott. In 1957, he helped found and was elected president of the Southern Christian Leadership Conference (SCLC), which had the goal of providing new leadership for Civil Rights Movements. He again applied Gandhi's beliefs and techniques to the many civil rights activities carried out by SCLC through the South as well as in Chicago and Los Angeles. Over the next 11 years, King was arrested more than 20 times. In 1959, Dr. King and his wife, Coretta, traveled to India as the guest of Indian Prime Minister Nehru. He came back from India even more convinced that Gandhi's methods were the key to success for blacks in their struggles to obtain equal rights.

In 1960, Dr. King moved his family back to Atlanta and assumed a joint pastorate of Ebenezer Baptist Church with his father, Rev. Martin Luther King, Sr., and pastored at Ebenezer until 1968. From his SCLC office in Atlanta, he and his fellow leaders planned subsequent civil rights campaigns. He helped lead the Alabama campaign for registration of Negroes as voters. He also helped direct the 1963 March on Washington,

D.C., at which 250,000 people heard him deliver his “I Have a Dream” speech. He was named “Man of the Year” by *Time Magazine* in 1963; in 1964, he was awarded the Nobel Peace Prize at 35, the youngest person to receive this honor.

At the age of 39, on the evening of April 4, 1968, King was assassinated while standing on the balcony of his motel room in Memphis, Tennessee, where he was to lead a protest march in sympathy with striking sanitation workers. Immediately after his death, his wife and others continued the struggle, establishing the Martin Luther King, Jr. Center for Nonviolent Social Change, the King National Holiday, and the King Memorial on the National Mall in Washington, D.C.

In works such as *Why We Can't Wait* and “Letter from the Birmingham Jail,” as well as his speeches, King developed a unique theoretical synthesis articulating the inherent connections among equal rights for people of color, economic justice for all, opposition to war, and a strategy of militant but peaceful civil disobedience that rejected gradual progress for the oppressed. According to his famous dictum, “justice delayed is justice denied.”

Controversies surrounding King included his willingness to break the law, allegations that he had plagiarized parts of his doctoral dissertation, and his decision toward the end of his life to move beyond his original focus on civil rights for blacks to the additional goals of ending poverty and resisting the U.S. military presence in Vietnam.

Kropotkin, Peter A.

Peter Alexeievitch Kropotkin (1842–1921) is regarded as one of the foremost revolutionary socialists of the late nineteenth and early twentieth centuries, a theoretician of anarchism and a leading exponent of anarcho-communism—a doctrine he helped to elaborate from the late 1870s. Born into considerable privilege, he grew up in what he described as Moscow's Faubourg Saint-Germain and attended the prestigious corps of pages, an elite school in St. Petersburg, beginning in 1857. In 1860, as a constitutionalist influenced by Alexander Herzen, he edited his first revolutionary paper. Two years later, motivated by a desire to find an outlet for his reforming impulses, Kropotkin refused the opportunity of a glittering career at court in the Guards and instead joined the mounted Cossacks of the Amur region. He spent the next five years in Siberia. Radicalized by the experience, he left the military in 1867 to study geography at St. Petersburg University. Five years later, encouraged by a trip to Western Europe, Kropotkin had become an anarchist. He gave up his academic career for revolutionary activity and worked with the radical Chaikovsky Circle, who championed education for the masses and political reform. Arrested in 1874, Kropotkin was incarcerated in Peter-Paul Fortress. Aided by his comrades, he escaped from the prison infirmary to begin a life in exile in Western Europe that lasted from 1876 until 1917.

Kropotkin's reputation rests on his ability to exploit a range of different media to propagate his views. Drawing on his scholarship and his preeminent position in the international revolutionary movement, he wrote

for educated middle-class audiences as well as for fellow radicals and exploited groups. In books, pamphlets, essays, newspaper articles, and speeches—many of which appeared in translation across the globe—Kropotkin articulated a set of claims about the irrationality and injustices of capitalism and the state to develop a specifically anarchist political theory. He was able to turn his mind to virtually any issue, and he chose topics ranging from the analysis of modern gardening practices and the science of X-rays to the migratory habits of Siberian tigers and the international division of labor to explore the social, economic, political, and cultural dimensions of anarchism.

Kropotkin is now often remembered for his book *Mutual Aid: A Factor in Evolution* and his critique of the Social Darwinian view of the natural world as a sphere governed by the competitive struggle for individual advantage. Yet this book belongs to a more extensive body of work. *Modern Science and Anarchism*, *Anarchism: Its Philosophy and Ideal*, *The State: Its Historic Role*, *Anarchist Morality*, and the posthumously published *Ethics* all probe themes related to mutual aid. In his lifetime, moreover, he was equally celebrated as the author of pamphlets such as “The Appeal to the Young,” “The Spirit of Revolt,” and “The Wage System” and books including *Fields, Factories and Workshops* and *The Conquest of Bread*. In addition, Kropotkin wrote an influential history of the French Revolution, an exposé (based on his own experiences) of the brutality of prison life (In *French and Russian Prisons*), and a critical review of Russian literature (*Ideals and Realities in Russian Literature*).

Running through Kropotkin’s anarchism is an ethical ideal that extends from his association with Russian populism. In his autobiography (*Memoirs of a Revolutionist*), he recalls how the Chaikovsky Circle to which he belonged developed an approach to social relations based on mutual respect, honesty, transparency, equality, and care. These ideas were consciously elaborated and practiced as a critical response to the secrecy, anonymity, and amorality of Nechaevism. And Kropotkin made reference to the personal virtues of the Chaikovskists when he later discussed the idea of mutual aid. The formal principle was described in terms of altruism: nonreciprocal giving, voluntary cooperation, and compassion.

Communism, the principle of distribution according to need, was not only a necessary corollary of anarchist ethics, but for Kropotkin, it provided the best institutional safeguard against private accumulation and/or the reappearance of centralized systems of state regulation. Its operation required the close integration of agriculture and industry and the careful, creative application of technology to facilitate local self-sufficiency.

Kropotkin's faith in the possibility of anarchy was informed by the role he believed authority assumed in the state: to infantilize as much as to frighten. With the extension of the state's regulatory powers, individual initiative was compromised. Yet Kropotkin reasoned that it was always possible to expand the realm for mutual aid by organizing outside state structures. His hope was that ordinary people might overcome their fears of repression and find the motivation to act for themselves, as he put it, from a desire to eradicate the economic injustices they suffered. Should this prove lacking, Kropotkin anticipated Caesarism: Following the Prussian model, states were tending toward greater militarization, industrial monopoly, and social control. It was from a concern to resist this drift that he decided—controversially—to support the Allies in 1914.

For anarchist critics, Kropotkin's anarchism imposes obligations and duties on individuals that are themselves oppressive. He admitted that anarchism was about sacrifice but denied that it involved abstinence. His appeal to the young was not to renounce dreams, only selfish gain. And the compassionate recognition of other's needs was not based on a calculation of best interests. This was the point he tried to make to Lenin, unfortunately without success, in 1917.

Labriola, Antonio

Antonio Labriola (1843–1904) was born in Cassino near Naples on July 2, 1843, to a modest middle-class family (his father was a high school teacher). In 1861, the year in which the newly united Kingdom of Italy was proclaimed, he enrolled in the University of Naples, at that time the leading center in Italy for idealist thought, and read philosophy. After failing to complete his degree, he worked as a schoolteacher and as a journalist while looking to secure an academic appointment. His early essays on Georg Wilhelm Friedrich Hegel and Plato, together with studies on Baruch Spinoza and Ludwig Feuerbach (which marked a significant step in his evolution away from idealism toward materialism), and the support of his university tutor, the great Hegelian scholar Bertrando Spaventa, earned him a university position at the University of Rome in 1874.

Although Labriola is generally regarded as the founder of Italian Marxism, he in fact became a Marxist only toward the end of his life. In correspondence with Friedrich Engels, whom he came to know along with other leading European socialists in the early 1890s, he described himself as having gone through an intellectual evolution not dissimilar to that of Marx: an initial and somewhat intoxicating encounter with Hegel, a subsequent period in which he sought to free himself from Hegel, and finally a commitment to historical materialism.

For most of the 1870s and 1880s, Labriola might best be described as a “bourgeois” moderate, committed to a secular culture, to the separation

between church and state, and above all to the expansion of education to the working classes, which he saw as vital for broadening Italy's democratic base and strengthening the political institutions at a time of mounting economic and social unrest and growing concern at the quality of the country's parliamentary government. It was in recognition of his commitment to educational concerns that in 1877 he added to his chair the job of director of the Museo dell'Istruzione e di Educazione—a state appointment he owed to the reform-minded minister of education Ruggero Bonghi.

Labriola was one of those unusual people who, with age, moved to the left. By the mid-1880s, “moderate” was no longer an adequate a description for someone who had become critical of liberalism, espoused the extension of the suffrage, advocated welfare support for the poor and the disabled, and promoted mass schooling. In 1887, he described himself in a letter to a Rome newspaper as being “theoretically socialist,” and the following year, he delivered a speech to steelworkers on “*Le idee della democrazia*”—the text has unfortunately been lost—in which he announced his commitment to political activism and his hopes for a “government of the people made by the people itself.” Like most of the (left) Italian intelligentsia, he was also an enthusiastic “social” imperialist and believed that the conquest of Libya would enable Italy to catch up with other European countries. In the early 1890s, he produced a set of essays that constituted his main work, published in 1895 under the title: *Saggi intorno alla concezione materialistica della storia* (1895) (English title: “Essays on the Materialist Conception of History”). Engels's positive verdict (*Alles sehr gut*—“It's all very good”) and their publication in the journal *Le Devenir social* edited by Georges Sorel, enhanced his wider fame. In fact, he had become one of the first academic Marxists in Europe.

Labriola's method of exposition and argument displayed many of the virtues and defects of subsequent Italian Marxism. There was a rejection of dogmatism, a disdain for the overarching summa so loved by German socialists such as Karl Kautsky, and a refusal to see the connection between the economic base and the political and ideological superstructure as being automatic. At the same time, the opaque prose, the lack of precision, and the absence of systematic analysis of the subject matter made it difficult for

his so-called “genetic” (a term he favored over the fashionable “dialectical”) method to be applied to solidly grounded empirical analyses. These remained the preserve of the school of positivist sociologists. His relationship with the Italian Socialist Party (first constituted in 1892) and particularly with its leader, Filippo Turati, was often fraught, and he was disappointed by the idealist turn of the influential philosopher Benedetto Croce against Marxism. He died of cancer in 1904 in Rome. Later in the twentieth century, he was championed by both Antonio Gramsci and Palmiro Togliatti, but he remained little known outside a narrow circle of academic specialists.

Laclau, Ernesto

Laclau, Ernesto

480

481

Laclau, Ernesto

Ernesto Laclau (1935–) is an Argentinean-born political philosopher whose works have contributed significantly to the development of post-Marxist thought and recent theories of political discourse, ideology, and radical democracy. He began his studies at the University of Buenos Aires, where he was also active in various left-wing movements including the Socialist Party of the National Left. In 1969, he moved to England to continue his studies at Oxford University. Since 1973, he has taught in the Department of Government at Essex University, and he has held guest professorships in the United States.

Early in his career, Laclau was already skeptical of the classical Marxist emphasis on the determining role of the economy. His studies of capitalism in Latin America, as well as his political activities in Argentina, convinced him that culture and ideology are as important as the market. This insight led him to embrace the thought of Antonio Gramsci and Louis Althusser. The influence of Althusser's structural Marxism waned in subsequent years as Laclau became more engaged with the poststructuralist theories of thinkers like Jacques Lacan and Jacques Derrida. Following on the 1977 publication of a well-received book titled *Politics and Ideology in Marxist Theory: Capitalism, Fascism, Populism*, Laclau embarked on a fundamental critique of Marxism and a reconceptualization of radical thought. The first fruits of this project appeared in *Hegemony & Socialist Strategy*, the influential book that Laclau co-authored with his wife, Belgian-born philosopher Chantal Mouffe. Published in 1985, the book announced itself

as the first significant effort to develop a post-Marxist theory of radical politics.

Hegemony & Socialist Strategy argues that Marxism, with its deterministic logic and essentialist categories, no longer provides an adequate guide for a new political era characterized by the breakdown of class-based politics and the post-1968 proliferation of new social movements. To address this complex social terrain, Laclau and Mouffe combine Gramsci's theory of hegemony with poststructuralist discourse theory. Contrary to classical Marxism, they argue that neither social identities nor political conflicts can be exhaustively traced to an ultimate economic foundation. Whereas Gramsci sought to supplement Marxism's determinist model with a theory of contingent struggle for sociocultural hegemony waged between the bourgeoisie and the proletariat, Mouffe and Laclau free Gramsci's theory from its lingering attachment to the Marxist base-superstructure model. Hegemony, they argue, is an antagonistic process whereby the social world is constructed through discursive practices operating in a political space that is not itself determined by the logic of anything exterior to it. In the absence of any point of ultimate anchor, social meaning becomes fluid, and the impossibility of closure opens the possibility of hegemonic politics. Instead of preserving a fixed and supposedly immutable set of social classes or categories, these politics proceed through contests over the meaning of existing social norms and value commitments, as political actors articulate equivalential links among entities within a field of discourse. So, for example, the articulation of the Rights of Man and Citizen opens further arguments that extend that initial claim of equal rights to people of color, women, homosexuals, the physically disabled, and so forth. Building on poststructuralist theory, Laclau and Mouffe argue that hegemony functions by stabilizing meaning around a core signifier. However, that stability is partial at best because the social world is ultimately open, "a result," they write, "of the constant overflowing of every discourse by the infinitude of the field of discursivity" (1985, 112–13). Laclau and Mouffe's original synthesis of Gramsci and poststructuralism furnishes a base for their conception of radical democracy, which they see as the hegemonic struggle to extend democratic rights and practices to subaltern groups within a social space characterized by contingency and open-endedness.

In subsequent years, Mouffe has deepened her commitment to the idea of radical pluralism and an agonistic (inherently conflictual) model of liberal democracy. Laclau, by contrast, grew worried over a trend that their initial theory of hegemony does not address: The replacement of classic Marxism's class-based model of politics could succumb to a postmodern politics of identity, which proliferates and celebrates particularity. He became convinced that the revival of left-wing politics in the wake of Marxism's collapse depends on recovering a universalist dimension that would once again unify specific social struggles into a broader process of emancipation. Laclau's work in the 1990s and 2000s is dominated by the search for a viable notion of universality that could overcome the fragmentation of the Left while avoiding a simple relapse into foundationalist theories of meaning or deterministic logics of historical development. To this end, Laclau has extended their initial theory of hegemony in new and productive ways in an attempt to conceptualize universalism as a contingent process of social construction. Laclau first formulates this project in *New Reflections on the Revolution of Our Time* (1990). He defends his ideas in a spirited three-way exchange with Judith Butler and Slavoj Žižek in *Contingency, Hegemony, Universality* (2000), and he furthers his ideas in *Elusive Universality* (2010).

Latin American Political Thought

Latin american political thought

481

487

Latin American Political Thought

Latin American political traditions are tied to, but different from, those of European political ideas. Because in many parts of Spanish and Portuguese America, there was also a large and significant influence of indigenous ideas into the political mindset of thinkers, it is difficult to classify Latin American political thought as coming purely out of the “Western” intellectual tradition. The Latin American way of looking at the political world is a fusion of indigenous beliefs with ideas derived from the Western European tradition. It is difficult to even unitarily quantify the Latin American region, both geographically and culturally, due to the deep diversity of cultures, ethnicities, races, religions, languages, and modes of life that have been present in the area since before the term was employed. However, as Zea (1991) has shown, a strong case can be made that the common trajectories and leitmotifs in the region can be construed as making up a generally coherent tradition of political ideas. The tradition is made up of three main components: political thought, political theory, and political philosophy. Political thought refers to less systematic works or traditions (such as pre-Columbian thought and also the vast literature of political fiction in the twentieth century); political theory to praxis intended to address particular political problems (such as Mariátegui’s writings on Peruvian reality); and the political philosophy to more general and universal concerns (such as Las Casas’s treatment of race). These three ways of intellectually considering the political world form a consistent, if highly eclectic intellectual tradition.

Pre-1492 and the Colonial Period

Before the emergence of the term *Latin America* in the 1830s in French social theory, there were political ideas of import in the region. The indigenous civilizations of the Inca, Aztecs, and Maya, among others, developed distinct moral, religious and political values that greatly differed from what the Spanish Conquistadores brought in the post-1492 era, upon the conquest of the Americas. For instance, the *Popol Vuh* and the *Chilam Balam*—sacred texts of the Maya—possess intricate and complex accounts of cosmology, ethics, religion, and social order. These ideas dominated much of the Yucatán peninsula and are extant today in areas like Chiapas and greatly influential in the political thought of thinkers such as Subcomandante Marcos and Rigoberta Menchú. The great Aztec Empire, a sophisticated political and military machine that used religion as a way to consolidate power, teaches us, *inter alia*, about the nature of imperial policy and administration. The tradition of the Incas also had continued influence. Unique concepts such as the *Pachamama*, or Mother Earth, positing a deep respect for nature and the universe as well as for ethical relations among humans, have lasted for centuries. *Ama sua, ama quella, ama llulla, ama llunk'a* (do not steal, do not be lazy, do not be a liar, and do not be servile) is a fundamental principle of Inca ethics that persists to this day in the ideas of thinkers like Evo Morales.

Latin American political thought as a distinct concept started with the arrival of the Spanish on the island of Hispanola. The New World as an idea could exist only with the discovery of the unknown and the conquest of the Americas. It was only with the contact with this New World that modernity could reach its full development, since it was the “discovery” of the Americas that led the world to begin its unification and globalization (see Dussel 1992). Modernity implies newness, change, and progress, and though the East had already made contact with Western Europe, it was the Americas that truly encapsulated those ideas. The violent conquest of the indigenous peoples by the Spanish generated many debates, such as the one between Bartolomé de las Casa and Juan Ginés de Sepúlveda in Valladolid in 1550–51. For Las Casas, the Amerindians were not to be denied their full human dignity, despite having different cultures and being of different races (*linajes*) vis-à-vis Europeans. Sepúlveda argued that they were *homunculi*

or small, humanoid beings that were not fully human. Whether reason and culture were to be central in the definition of humanity was central to these debates, which heavily relied on Aristotelian natural law theory. The concept of Thomistic natural right was used heavily by both sides of the debate, as in the work of Francisco de Vitoria. Those who would defend the actions of the Spanish Empire, such as Juan Nuix, believed that the New World had great need of the influence of European culture and religion. While Las Casas shared this view, he did not agree with the idea of natural slavery or barbarism, which came out of Aristotelianism. Las Casas, because of this rejection of Aristotelian ideas, can be thought of as a figure helping the transition from the medieval world to the modern. Sor Juana Inés de la Cruz, a seventeenth-century nun, poet and philosopher who lived in what is modern Mexico, was also crucial to the modernizing of ideas in the colonial time period. Her critique of Aristotelian patriarchy can be seen as a forerunner of feminism; she rejected the idea that men alone should be educated.

Nation-States and Republican Thought

The consistent and stable Spanish imperial rule suggests that Spain was able to maintain relative order and unity through the use of administrative mechanisms in the New World (Grafe 2011). There was certainly resistance, rebellion, and revolt among indigenous and Creole groups throughout this period, but the decline of Spanish domination truly began only in the early decades of the nineteenth century. In political thought, the eminent figure of the republican period is the Venezuelan statesman and military leader Simón Bolívar. Republican theory is indebted to the political ideas of the Great Liberator for various reasons. Principal among them is that he understood the ethnic and racial diversity as well as widespread miscegenation among the people of Spanish America. For him, this signified a new global phenomenon. It was at the same time a source of political stability (due to greater racial unity) but also of instability (due to gradations of mixing and ethnic competition). By using a Machiavellian form of martial republicanism that balanced the interests of elite Creoles with those of the *pardo* mass, he was able to unite the diverse political units of the Americas. While militarist in nature, Bolívar's thought was defined

by anti-imperialism, and warned against the growing imperial ambitions of the United States of America.

Concern over the growing influence of the United States can be seen in other thinkers of the nationalist period. Once the Bolivarian idea of *Gran Colombia* (a unified northern South America) failed, nation-states emerged, each with their own imperatives to define a unique identity. José Martí in Cuba shared Bolívar's concern for U.S. expansionism and urged the nascent Spanish republic to respect the freedom of the new Cuban republic. Martí declared that "there are no races," in *Nuestra América*, or "Our America" (referring to the Spanish American region, whose various regions, he believed, shared many cultural traits). Martí's poetry, journalism, and prose are early examples of the fusion of aesthetic modernism with politically *engagé* intellectual activity. The nationalist period also produced very diverse thinkers. Domingo Faustino Sarmiento in Argentina proposed the modernization of his country through the emulation of U.S. methods of pedagogy, the creation of a national myth of the gaucho to unify Argentines, and a critique of *caudillismo*, or rule by a strongman in his magnum opus, *Facundo*, which was an attack on Juan Manuel de Rosas, who ruled Argentina as governor from 1835 to 1852. However, despite being an eminent figure of liberalism, Sarmiento advocated the extermination of indigenous peoples. Another important liberal, Juan Alberdi, similarly believed that Latin American culture ought to be seen as purely European.

Venezuela's Laureano Vallenilla Lanz and other thinkers rejected the racism of Gobineau and recovered the idea of democratic Caesarism (influenced by French social theory) for countries deeply divided by poverty and racial differences. In effect, one of the major contributions of Latin American political thought is the frequent focus on the meanings and complications of the idea of race. Building on the seminal ideas of Las Casas and other colonial thinkers, subsequent *pensadores* developed new, alternative accounts of the role of race in politics and the creation of citizenship. Other than the explicitly racist perspectives of Sarmiento, Juan Alberdi, and others, there were also views that differed, such as the indigenismo of Alfonso Caso, Manuel Gamio, and Aguirre Beltrán. The writings of Renato Kehl, Fortuno Hernández, and Víctor Delfino also provided commentary on Eugenics.

Seminal figures of the nineteenth century include Andrés Bello, a Venezuelan-born Renaissance man who made contributions to legislation, philosophy, philology, pedagogy, humanism, and poetry. Considered an important figure of conservatism, he spent much of his life in Chile, where he worked on the Chilean Civil Code, which was similar to the Napoleonic Code. In London, he met Francisco de Miranda, the Venezuelan leader of independence. Miranda had been a forerunner of Bolívar in the battle for independence. Bello also consorted with important intellectuals such as José María Blanco and Vicente Rocafuerte. In Chile, he was an interlocutor of Victorino Lastarria and Francisco Bilbao.

Positivism and idealism were strong currents at the turn of the century. In Argentina, Agustín Suárez supported the scientific method and disregarded the ideas of metaphysics and theology. Carlos Octavio Bunge provided a social psychology of Spanish people as well as of various ethnic and racial groups of the Americas. José Ingenieros was an eminent proponent of positivist sociology. Alejandro Korn provided a critique of positivism, arguing that reality is a psychic phenomenon, and proffered a specifically Argentine philosophy in an effort to distance Latin American ideas from those of Europe. In Bolivia, the debate over race was intense. Alcides Arguedas's *Pueblo enfermo* is an account of the social psychology of Amerindians. While sometimes myopic and essentialist, it was widely influential at home and abroad. In Brazil, Euclides da Cunha provided a literary-psychological account of Brazilian national identity in *Os Sertões*, in a way that is similar to Sarmiento's *Facundo*. Parallel perspectives were provided by Manoel Bomfim and Gilberto Freyre, whose *Casa-grande e senzala* is considered a founding text of the theory of racial democracy and has been critiqued as overly optimistic by scholars such as Florestan Fernandes.

Liberalism is not as influential as in the United States, nor is it as preponderant as other political currents in Latin America; nonetheless, it is an important tradition in the Latin American history of ideas. While many have seen it as merely an import from Europe or the United States in lands more amenable to dictatorship and *caudillismo*, in fact there was widespread preoccupation with some core liberal issues in many countries, such as the separation of church and state, freedom of association, rights

over property, and free expression. Sarmiento and Alberdi proposed important liberal reforms in Argentina, while Mexico was a breeding ground for many innovative liberal thinkers. These include José María Luis Mora, Lucas Alamán, Francisco Zarco, and Benito Juárez. During the Porfiriato, near the end of the nineteenth century, eminent liberals like Justo Sierra, José María Vigil, and Emilio Rabasa consolidated the era of Mexican liberal thought.

Critical Perspectives on Positivism

Critiques of progressive nationalism began to emerge when the idea of the nation began to fail, especially with the shortcoming of the Mexican Revolution and its positivist ethos. German thought influenced the two major strands of this critique. One was the romantic aestheticism of thinkers such as José Vasconcelos and José Enrique Rodó, both of whom were influenced by Friedrich Nietzsche and G. W. F. Hegel. The other is Marxism; thinkers such as José Carlos Mariátegui, who was also influenced by Nietzsche and by the Leninist tradition, rejected the idea that the nationstate could be the main driving force for real progress for Latin America. Vasconcelos, profoundly anti-Marxist especially in his later years, believed the idea of racial identity could unify people better and give them meaning. His classic essay *La raza cósmica* is a cardinal, fraught text in Latin American thought. In it, he propounds a theory of racial synthesis, in which all the major “races” of the world become miscegenated to create a single one, in the Amazon basin, which then produces a beauty-centered, non-rational but higher culture. Ignorant of Amerindian ideas, and proposing the Christianization of the Americas, Vasconcelos’s key text is nonetheless a crucial critique of reified racial categories and of the moral values of the Anglo-Saxon world. In a similar critique of European materialism and individualism, Rodó rejects Nietzsche’s anti-Christian ethos but embraces his aestheticism.

For Mariátegui, whose ideas shared common ground with those of the Italian Marxist Antonio Gramsci, the best method to reveal the realities of the Peruvian and Latin American world was Marxism. Spanish rule in the Americas had been fundamentally feudal, hence Latin America had never gone through a process of modernization. For the Peruvian *pensador*, the

agrarian question was the key to understanding the “Indian Problem.” Race as such was not the essence of the Latin American conundrum, as Vasconcelos believed; rather, the class conflict born out of quasi-feudal modes of production generated deep cleavages in each society. But the Marxism of Mariátegui was not orthodox. While he followed the Leninist idea of the importance of a vanguard and a proletarian political party, he argued that much of the work of the revolution could be carried out by engaged intellectuals and artists. Thus, the violence that had long been associated with Marxism was not necessary for the advent of the revolutionary society. In his writings on history, religion, and even Charlie Chaplin, Mariátegui showed how Marxism was not an ossified doctrine but rather a method to disassemble class oppression.

Mariátegui greatly influenced subsequent Marxist thinkers in Latin America. Given the levels of underdevelopment in the region, the Marxism that was adopted had to be of the unorthodox kind. Theoretically, the most prominent Marxist after Mariátegui is Ernesto “Che” Guevara. While a man of praxis and action, his writings on guerrilla warfare, imperialism, and the New Man are important innovations in Marxist theory. Guevara radicalized the importance of violence in Marxism, arguing for a complete commitment from revolutionaries and thereby rejecting the idea of “dirty hands” as a moral problem. He also intensified the critique of imperialism, claiming that it was not merely a capitalist product but could also emerge from within major Socialist states like the USSR. Moreover, his belief that praxis (critical, creative, human life-activity) could radically transform men and women into different kinds of beings through labor shows a profound humanism that is an ethical turn in Marxist theory. It rejects essentialism and naturalism, while it establishes a new code of ethics based on labor and participation. Guevara also urged for the greater unification of Spanish/Portuguese America, a motif that has roots in Bolívar. Further developments in Latin American Marxism reacted to Mariátegui and Guevara, including the guerrilla tactics of Carlos Marighella, the Trotskyism of Guillermo Lora in Bolivia, the socialist nationalism of Fidel Castro, and Haya de la Torre’s APRA movement.

Marxist Influence and the Aftermath

Marxism and neo-Marxism continued its strong influence on Latin American political thought throughout the twentieth century. The combination of a successful blueprint for the revolution as demonstrated in Cuba and the persistence of right-wing military governments provided enough inspiration for this continued influence. Before the Cuban revolution, the rule of Juan Domingo Perón in Argentina led to the rise of what has been called “populism,” a term widely used to characterize Latin American political rulers and movements since then. The term is generally used to describe the existence of an extremely charismatic leader who brings together a popular movement against elites, but this concept is under-theorized since this description can often apply to leaders in democratic politics as well. The paradigmatic cases are Perón and Getulio Vargas, both of whom had ties to the military and staunchly anti-Marxist positions. Populism requires a leader with charisma who uses demagoguery to stay in power and is largely devoid of ideology. The idea of favoring the poor in opposition to elites is an integral part of it, and due to the preponderance of poverty throughout Latin America, it has often been a highly influential concept.

The concern with poverty is visible in other political traditions as well. In Gustavo Gutiérrez’s *A Theology of Liberation*, published in 1973, he argued from a Dominican perspective that only through the eyes of Christ can one can understand scripture. This idea means that the poor should be favored. The “preferential option” for the poor is read both spiritually and literally by Gutiérrez: economic poverty is the result of oppression and exploitation. In part influenced by neo-Marxism, Gutiérrez argues that Christianity is about helping others, specifically the materially poor, because the reality of Christ is historicized, that is, moral values are not abstract but practical and real. They are the result of crises that emerge out of specific historical conditions. Thus, Gutiérrez called for reform within the Catholic Church, Christology (understanding and learning from the life of Christ), historicization (placing religious ideas on the real world), and a sense of urgency (the need to act and not merely reflect upon spiritual matters). Other liberation theologians like Leonardo Boff and Ernesto Cardenal share similar ideas, and they can also be seen in the liberation philosophy of Enrique Dussel, as well as in the critical pedagogy of Paulo Freire.

Freire's ideas were largely rooted in Hegel and historicized the master-slave dialectic by placing it in the classroom. Freire argued that oppression exists at the social level, and it is manifested in teaching techniques in mainstream pedagogy. For him, most professors simply lecture to students in a condescending manner, without any room for critical thinking. This "banking model" of education, in which teachers simply "deposit" information in passive students, creates automatons, not citizens. It instills a sense of inferiority and class-domination in students. Freire, like Gutiérrez, overturns the domination paradigm and urges for a different dialectic, one in which students teach and teachers learn as well. This method, influenced by Martí and Guevara, had significant influence in liberation pedagogy throughout the continent and provided a new model of education for democracy. Thinkers like Domitila Chungara of Bolivia posited similar concerns in Marxian-feminist language, in *testimonio* literature.

The influence of political economy on political thought in Latin America continued into the eighties. Dependency theory, an economic analysis of international trade, as well as neoliberal economic theory, had widespread political implications. Raúl Prebisch, an economist with the Economic Commission for Latin America and the Caribbean, argued that declining terms of trade for Latin American economies could not be easily surmountable. Prices of primary products rose at a much slower rate than those for capital goods. Therefore, Latin American economies, heavily dependent on imports, would be adversely affected in the long run by this structural condition of the world economy (Faletto and Cardoso 1979; dos Santos 1967). As a consequence of this economic theory, many political leaders opted for import-substitution industrialization (as proposed by Celso Furtado and others). At the expense of smaller industries, this policy choice generally favored large national industries, and created a large political class that was dependent on favoritism and clientelism. There were numerous social and economic consequences to this type of policy, instituted by many left-of-center regimes. As a result, in the mid-1980s, free-market, liberalization, and privatization recipes to counter hyper-inflation and stagnation were proposed by center-right economists, many of whom were influenced by the ideas of the economics department at the University of Chicago. The "Chicago Boys," who had had impact on the Chilean economy under Augusto Pinochet's rule in the 1970s, gained

renewed prominence by 1990. Economic issues have been a large factor in the development of Latin American political ideas. It is in the ceaseless debate on the role of the state in postwar economy that this is especially true, and the debate only grew after the collapse of the Soviet Union in 1991. Hernando de Soto and Alvaro Vargas Llosa, both of Peru, have been prominent advocates of greater liberalization and free market economy. The former has advocated the radical reduction of bureaucratic red tape to activate the dormant capital of the poor, while the latter has argued that the neoliberal reforms of the 1990s did not go far enough. Many supporters have been behind the use of these ideas.

A Mixed Tradition

Neoliberalism did not live up to its lofty promises. By the mid-1990s, while hyper-inflation was curbed in many countries, unemployment rose as a result of the privatization of state-owned enterprises. This caused social upheavals and political turmoil, which eventually led to a swing back to the center-left. After the experiments of the radical left in the 1960s and the experiments of the radical right in the 1970s and 1980s, there is now a wide variety of pragmatic center-left regimes in the region. A new era of socially conscious pragmatism and democratic socialism has resulted from the experiences of the past. Thinkers like Evo Morales and Alvaro García Linera in Bolivia have blended Marxian concerns with indigenous traditions. Others, like Leonardo Avritzer and Enrique Peruzzotti, have proposed pragmatic methods to promote deliberative democracy and participatory budgeting, which allows for greater grassroots democratization. Market-friendly states have also emerged as viable options, especially those of Chile and Brazil.

The development of Latin American political thought has been the result of years of experimentation. The varied approaches to the subject have produced a number of alternative models on development and of how best to operate within the political realm. The declining power of the Church and religion in politics in recent decades, the consolidation of democracy and the shrinking role of the military, as well as the unique ethnic and racial composition of the region, the growing power of social movements and movements toward gender equality, and the recent consideration of energy

and environmental concerns, have all shaped contemporary Latin American political ideas. In the near future, the continent will doubtless continue to provide further experiments in pragmatism (Unger 1997) and postmodern politics (Mignolo 1999), as it is the product of sundry influences from within and without. We can note that these are reflected in the region's rich literary tradition, in which fiction is often an expression of political ideas (as in the work of Gabriel García Márquez, Mario Vargas Llosa, Augusto Roa Bastos, Alejo Carpentier, Roberto Bolaño, and others).

Law and Political Thought

In the modern period, the most original and influential theories about law and politics were developed in connection with a set of far-reaching, interrelated questions about the definition of law, the purpose of law, the relationship between law and morality, and the existence of natural law and natural rights.

Montesquieu

Charles-Louis de Secondat, Baron de La Brède et de Montesquieu (1689–1755), published *The Spirit of the Laws* in 1748. In this widely read and highly influential work (it appeared in 22 editions within 18 months after its first publication), Montesquieu defines laws as “the necessary relations deriving from the nature of things.” Laws are both the relations that exist between God and created beings and the relations of these created beings to one another. For Montesquieu, it is possible to discern a uniformity in the relations between things, despite their wide diversity. Thus, although one body is capable of moving another body in various ways, such motion will always be in accordance with the relations of mass and velocity. A similar kind of uniformity in the midst of diversity can be found in human affairs. Even before humans make their own positive laws, there exist “possible relations of justice” that determine which actual relations between humans are just and which are unjust. For Montesquieu, there are thus laws of nature or natural laws that are grounded in the very nature of things and that

underlie true “relations of fairness” as they exist apart from any positive or human-made laws, and apart from the will of any sovereign.

Although affirming the existence of natural law, Montesquieu differs from previous thinkers who held that one or another form of government was the “most natural” for human beings. For Montesquieu, what is “most natural” is not that which is “most common” or “most basic” but what is most in accord with a thing’s nature or its internal principle of activity. Just as individual things have their own natures, so too a people or a nation can be said to have a nature or “character” or “general spirit” of its own. The general spirit of a people emerges in connection with a wide variety of particular conditions pertaining to that people, including their climatic and geographical situation, their way of life, their degree of liberty, their religion, their level of wealth, the size of their population, their modes of commerce, and their mores and manners. When contemplating acts of legislation, says Montesquieu, legislators should not be guided by abstract, rationalistic ideas about justice but by the general spirit of the people for whom the legislation is intended. Law is most effective, after all, when it is least coercive and most suited to a people’s “natural genius.” Furthermore, legislators should not try to correct all the mores and manners of a people but only those that are manifestly unjust or harmful. Even when some mores and manners stand in need of correction, it is best if political leaders aim to correct them, not by relying on the coercive force of the law but by appealing to other mores and manners already recognized by the people.

One of Montesquieu’s best-known contributions to legal and political theory is his argument for a “separation of powers” within the state. Montesquieu identifies three possible kinds of powers within the state: the legislative power, the executive power over the things depending on the right of nations (or simply “the executive power”), and the executive power over the things depending on civil right (or simply “the judicial power”). If political liberty is to be preserved, Montesquieu argues, then these three powers must be vested in different individuals or different bodies, each acting independently of the other two. If individuals are to have political liberty, says Montesquieu, then the government and laws must be arranged so that no citizen stands in fear of any other citizen. Such becomes

impossible, however, when two or more of the state's powers are vested in a single individual or in a single body.

Montesquieu's *Spirit of the Laws* was praised by radical progressives such as Voltaire (who appreciated Montesquieu's observations about religious diversity and tolerance) but also by traditionalist conservatives such as Edmund Burke (who shared Montesquieu's skepticism about affecting social change through coercive legal means). The influence of Montesquieu's thought regarding the separation of powers is readily discernible in the *Instruction* of Catherine the Great of Russia, in the *Federalist Papers* (especially nos. 47 through 51), in the American Constitution, and in the French *Declaration of the Rights of Man*.

William Blackstone

The work of William Blackstone (1723–80) is important not so much for its originality as a piece of legal theory as for its originality as a work of systematization. Blackstone's four-volume work, *Commentaries on the Laws of England*, was first published in England between 1765 and 1769 and then in the United States between 1771 and 1772. The *Commentaries* gave systematic form to a vast range of previously disconnected legal questions, showing how almost every aspect of English law could be analyzed and explained through the basic principles of a "rational science" of law. This "rational science" was divided into four parts, focusing on "the rights of persons" (Book I); "the rights of things," by which Blackstone meant the rights that people can have in things (Book II); "private wrongs," including torts (Book III); and "public wrongs," including crimes against other citizens, against God, and against religion (Book IV).

Blackstone defines law as "a rule of action dictated by some superior being." As applied to human action, laws are the precepts by which humans are commanded how to regulate their behavior. For Blackstone, human beings are obliged to obey the laws given to them by God, for an inferior being is inevitably obliged to follow the rules of conduct given to it by the superior being on which it depends. But human beings are not only *obliged* to obey the will of God, they are naturally *inclined* to do so as well. This is because God, in His infinite wisdom and goodness, constituted human

beings so that they would need no inducement to follow the law of nature other than their own self-love, which is the “universal principle” of human action. According to Blackstone, the rule of obedience for all human action can be reduced to one precept, which constitutes the foundation of all ethics or natural law: “[M]an should pursue his own true and substantial happiness” (1765, Vol. I, 41).

For Blackstone, the precepts of the natural law are universally binding on all human beings, regardless of time or place. All positive, or human-made, laws derive their force and authority from the natural law; human laws that are contrary to the natural law can have no validity. If humans were always clear and unprejudiced in their reasoning, they could know how to act by relying on their natural reason and their natural inclinations alone. But since humans are prone to ignorance and error, they need the further guidance of revealed or divine law, which God has provided through the scriptures. But the natural law and the divine law, on their own, are insufficient for guiding human conduct. This is because humans are neither self-sufficient nor courageous enough to live entirely on their own; they need to live in society with one another. Since it is impossible for all human beings to be united within a single, comprehensive society, they end up forming a multiplicity of separate, but interacting, states. Accordingly, there arises not only the need for municipal law or civil law (which governs the relations prevailing within a single state), but also the need for a “law of nations” or *jus gentium* (which governs the relations of different states to one another).

Municipal or civil law, says Blackstone, is a rule of civil conduct prescribed by the supreme power within a state. For Blackstone, the primary aim of human society and thus of municipal law is to protect individuals in their enjoyment of the “absolute rights” they possess simply in virtue of the immutable laws of nature. These absolute rights include the rights to personal security, to personal liberty, and to personal property. No human legislature has the power to abridge or destroy these rights, says Blackstone, unless their possessor has committed an act that amounts to a forfeiture of such rights. A secondary aim of human society and thus of municipal law is to protect individuals in their enjoyment of “social” or “relative” rights (e.g., the right to trial by jury), which result from and are posterior to the formation of states and societies.

The municipal law of England can be subdivided into two kinds: “the unwritten common law” and “the written or statute law.” Because written law is expressed in general and not particular terms, it follows that no written law can fully anticipate the concrete circumstances under which it might be applied. Thus, the determination of what a written law actually commands in some particular circumstance will require some recourse to the rationale or justification behind the law. Since only intelligent beings can discern when and how the law’s rationale might apply, “it is necessary that when the general decrees of the law come to be applied to particular cases, there should be somewhere a power vested of defining those circumstances” for applying the law (1765, Vol. I, 62). Thus, there arises the need for judges, who are authorized to decide cases in light of “equity” by taking into consideration the particular circumstances surrounding individual cases. If the rationale or justification behind a written law ceases to apply, says Blackstone, then “the law also ceases with it” (*Commentaries*, 1767, Vol. III, 219; 1765, Vol. I, 61). For Blackstone, the unwritten “common law,” as embodied in the understandings, practices, and customs of judges, can never be supplanted by a system of written law or “statute law.” When deciding cases in light of equity, Blackstone goes on to argue, judges generally should follow past precedents; however, judges may disregard previous decisions when they are manifestly absurd or unjust. This is not because such previous decisions are instances of bad law; rather, it is because—being contrary to reason or justice—they are not law at all.

Blackstone’s *Commentaries* were exceedingly influential at the time of the American founding, and they were regularly cited by those in favor of ratifying the American Constitution (e.g., by Alexander Hamilton, in *Federalist* nos. 69 and 84) as well as by those opposed to ratification (e.g., by Patrick Henry, who argued, in reliance on Blackstone, that the Constitution should provide for jury trials in civil cases). Blackstone’s *Commentaries* remained a staple of Anglophone legal education for the next 150 years.

Jeremy Bentham

In 1763, Jeremy Bentham (1748–1832) attended the Oxford University lectures given by Blackstone that were later to become part of the latter’s

Commentaries on the Laws of England. But unlike Blackstone, who sought to explain and justify English law, Bentham was interested primarily in critique and reform. And unlike both Montesquieu and Blackstone, whose main contributions to legal thought can be found in individual works, Bentham disseminated his key ideas about law and politics through a vast collection of disparate writings, including *A Fragment on Government* (1776), *A Defence of Usury* (1787), *Introduction to the Principles of Morals and Legislation* (1789), *An Essay on Political Tactics* (1791), *Panopticon, or the Inspection House* (1787), *Emancipate Your Colonies* (1793), *Catechism of Parliamentary Reform* (1809), *Punishments and Rewards* (1811), *A Table of the Springs of Action* (1815), *Chrestomathia* (1816), *Church of Englandism and Its Catechism Examined* (1818), *Radicalism is Not Dangerous* (1819–20), and *A Treatise on Judicial Evidence* (1825). A summary of Bentham's criticisms of Blackstone can be found in his *Fragment on Government*, which is a shortened version of a more extensive critique, *Comments on the Commentaries*, published posthumously in 1928.

What we call law, says Bentham, is not grounded in the nature of things or in the divine ideas of an all-benevolent God; it is grounded instead in the will of a sovereign (whether this be an individual or a group) that has the power to command its subjects to act in certain ways, and to induce obedience in its subjects by means of punishments and rewards. For Bentham, the purpose of human law cannot be to protect any "natural" order of justice or "natural" rights as they allegedly exist apart from positive laws and apart from the will of a sovereign. This is because there are no such things as "natural" rights or "natural" justice in the first place. According to Bentham, a "right" is nothing other than an actual "security" enjoyed by someone under the protection of some more powerful person or body (such as the sovereign). It follows from this that there is no such thing as a right that is not an enforceable right; and no such thing as justice that is not enforceable justice. For Bentham, then, the positive law does not protect preexisting rights or enforce preexisting duties that persons allegedly have in a state of nature or as a matter of natural right; on the contrary, it is the positive law that brings into existence all the rights and duties that persons have in the first place. The ideas of law, offense, right, and obligation, says Bentham, "are born together" and are inseparably connected.

According to Bentham, proponents of “natural law” jurisprudence (including Blackstone) systematically failed to distinguish between “expositorial” (or merely descriptive) jurisprudence and “censorial” (or evaluative) jurisprudence. As a result, they also failed to distinguish between the law as it *is* and the law as it *should* be. On account of these confusions, “natural law” thinkers were led to the erroneous view that law, in order to exist at all, must be in accord with reason and justice and, conversely, that supposedly “bad” laws—being contrary to reason and justice—could not really exist as laws at all. Against such “natural law” reasoning, Bentham argued that it is obvious that “bad” laws can exist. For a law, after all, is nothing other than the command of a sovereign backed by the threat of force. It is obvious that a command can be issued, and those subject to it can be induced to obey, even if there is nothing “reasonable” or “just” about the command being issued. By arguing that the existence of law is one thing and its moral merit is another (or that there is “no necessary connection” between law and morality), Bentham laid the theoretical groundwork for what has since come to be known as modern “legal positivism.”

Bentham opposed “natural law” reasoning, not only because he regarded it as deeply confused as a matter of theory, but he also believed that it supported perniciously antireformist consequences in the realm of practice. If bad law is no law at all, as the “natural law” theorists held, then it becomes difficult to see how actual existing laws could be “bad” and thus in need of reform. For Bentham, it is only by acknowledging that “bad” laws can exist that we will be in a position to begin reforming them. Furthermore, the question of how bad laws should be reformed is not to be settled by reference to an empty, abstract, speculative account of “natural law”; instead, it is to be settled by reference to a readily accessible and easily understandable standard of right and wrong, namely, the principle of utility. According to this principle, an action is right to the extent that it tends to produce pleasure or happiness and wrong to the extent that it tends to produce pain or unhappiness. For Bentham, the actions of all individual and all legal regimes are to be measured and judged in accordance with the principle of utility or “the greatest happiness principle.” The guiding purpose of the law should be nothing other than to promote social welfare or utility or “the greatest happiness for the greatest number.”

Bentham's commitment to the principle of utility led him to hold that legal punishments could be justified only on the grounds that they incentivize good behavior and deter bad behavior in those who are subject to the law. As a result, he argued that legal punishment was not for the sake of retribution, and he sought to reform many of England's often-cruel penal practices that had been based on retributivist ideas about punishment. Bentham's belief in the principle of utility also led him to argue in favor of replacing the unwritten "common law" of England with a fully written, codified system of statutory law. Because the "common law" was unwritten and depended so heavily on the unpredictable, discretionary rulings of judges, it failed to provide legal subjects with sufficient advance guidance about how they should conduct themselves; and when the law fails in this way, he noted, it cannot properly serve to incentivize good behavior and deter bad behavior. Bentham famously derided England's regime of unwritten, judge-made "common law" as a regime of arbitrary, *ex post facto* law-making that was more suited to dogs than to human beings:

When your dog does anything you want to break him of, you wait till he does it, and then you beat him for it. This is the way you make laws for your dog: and this is the way the judges make law for you and me. They won't tell a man beforehand what it is he *should not do* (1843, 235).

A lover of neologisms (he invented the now-common words, "codification," "minimize," "maximize," and "international"), Bentham made a number of innovative proposals for concrete legal and social reform, including what he called a *Pannomion* (a complete and systematic code of laws that would leave no room for unreliable guesswork by citizens or arbitrary discretion by judges) and a *Panopticon* (a building whose design included a central observation tower allowing authorities at prisons, asylums, schools, and workhouses to see all of their charges all at once, without in turn being seen). In 1794, the English Parliament agreed to fund Bentham's Panopticon plan for a new prison, to be managed by Bentham himself (foundations for the prison were laid, but in 1804, the project was terminated on account of insufficient funding). Bentham's thought exerted a substantial influence over the later utilitarian and social reformist

philosophies of James Mill (1773–1836), John Stuart Mill (1806–73), Henry Sidgwick (1838–1900), and Alexander Bain (1818–1903).

Bentham’s positivistic jurisprudence helped to inspire the later legal positivism of John Austin (1790–1859), Oliver Wendell Holmes, Jr. (1841–1935), Hans Kelsen (1881–1973), H. L. A. Hart (1907–92), and Joseph Raz (1939–). Bentham’s utilitarian jurisprudence is the distant precursor to the “law and economics” school of contemporary legal theory, championed in its early days by Ronald Coase (1910–), Guido Calabresi (1932–), and Richard Posner (1939–).

Immanuel Kant

For Immanuel Kant (1724–1804), theorizing about the law cannot be based simply on our experientially derived judgments about human desires or needs since our merely empirical judgments can never yield the necessity and universality that are the true hallmarks of a genuine science of right. Instead, jurisprudence must take its bearings from the nonempirical or *a priori* concept of “right” (*Recht*) as such. According to its pure or *a priori* concept, “right” is the sum of the conditions under which the free choice of one person can be united with the free choice of others in accordance with a universal law. The “universal law of right” stipulates that persons may rightfully perform external actions only to the extent that the exercise of their free choice through such actions can coexist with the free choice of everyone else in accordance with a universal law. For Kant, the concept of right is necessarily connected with the authorization to use force or coercion (e.g., through the use of law). For a person acts wrongly when he or she hinders the free choice of someone else. Such a hindrance amounts to an act of coercion by the wrong-doer; for when the wrongdoer hinders the freedom of another, the wrongdoer forces the wronged party to do or refrain from doing something entirely apart from the wronged party’s own act of choosing. Now if one person’s use of freedom amounts to an act of hindering the freedom of another, then the use of coercion to prevent such a hindrance (the hindering of a hindrance to freedom or the coercive prevention of coercion) is justified.

Prior to Kant’s time, it was common to think that the coercion of free persons by means of the law was justifiable on the grounds that freedom

must be limited or compromised at times for the sake of achieving goods that are external to freedom itself. These goods might include the cultivation of individual virtue or the promotion of social welfare. Kant, however, rejects such an approach. For Kant, it is always wrong to coerce free persons for the sake of promoting goods that are external to freedom itself; for it is always wrong to use a person as a mere means to some end, even if the end for which the person is being used is an exceedingly important one. Significantly, Kant observes that what is right or justified does not pertain to relations between persons and external objects; it pertains instead to relations among persons. Although one person may never rightfully be used as a mere means for another person's ends, there is nothing about external objects as such that makes it wrong for persons to use them as mere means in the service of the ends that they freely set for themselves. Furthermore, free persons must be permitted to make use of external objects even when the objects being used are not in the spatial vicinity, or under the physical control, of the persons making use of them. Just as there is nothing about external objects as such that makes it wrong for persons to use them as means in the service of the ends that they freely set for themselves, so too there is nothing about the merely contingent *empirical conditions* of such objects (e.g., the merely contingent fact that the object exists in a certain spatial location or beyond the scope of a person's physical control over it) that can legitimately prohibit them from being used by persons in the service of their ends.

For Kant, in other words, it is necessary that persons be permitted to make use of external objects, not only through their *empirical* possession of such objects, but also through what Kant calls their *intelligible* or *noumenal* possession of them. To have intelligible possession of an external object, says Kant, is to have possession of it even when the person who possesses the object is not spatially adjacent to or physically in control of the object being possessed. Significantly, Kant argues that such intelligible possession of objects cannot be secured in a state of nature. For in a state of nature, says Kant, there is no generally accepted public authority for determining how the intelligible possession of external objects is to be acquired, enforced, and arbitrated in cases of disagreement. As a result, a person's ability to make use of an external object in a state of nature is forever insecure, dependent always on merely contingent empirical conditions, such

as whether the person is strong, smart, or lucky enough to keep the external object from being appropriated and used by others. But this is just to say that in a state of nature, all possession is something *other* than rightful possession.

For Kant, persons are obliged to exit the state of nature and enter into a civil condition, or a “condition of right” under the rule of law. They are obliged to do so, not because doing so will help them to secure ends that are external to freedom itself (e.g., the ends of cultivating individual virtue or promoting of social welfare). Instead, argues Kant, free persons are obliged to live in a civil condition (and, incidentally, obliged not to destroy this civil condition by means of revolution) since it is only in a civil condition that they can fulfill their vocation as free persons; for it is only in a civil condition that they can rightfully make use of external objects in pursuing the ends that they freely set for themselves. For Kant, the aim of the law is to make possible the conditions of free personhood as such, and not to promote ends that are external to free personhood. Kant’s theory of law thus stands opposed to all “welfarist” or “utilitarian” conceptions of the law. Kant’s jurisprudential thought, with its emphasis on the importance of free personhood (and the relative unimportance of promoting individual virtue or social welfare), has influenced several twentieth-century jurisprudential thinkers. The most famous of these thinkers, including some who depart in one way or another from Kant’s strict *a priori*, anti-welfarist theory of right, are John Rawls (1921–2002), Robert Nozick (1938–2002), Ronald Dworkin (1931–), and T. M. Scanlon (1940–).

Friedrich Carl von Savigny (1779–1861) was an early admirer of Kant, but inspired by post-Kantian Romanticism, he ended up rejecting what he regarded as the overly rationalistic, unhistorical character of Kantian jurisprudence. As a leading proponent of the German “historical school” of jurisprudence, Savigny went on to argue that the nature and origins of “right” should be understood not by reference to any nonempirical or *a priori* concept but by reference to the historically situated, empirically accessible *Volksgeist*, or “spirit of a people.” Another early follower of Kant, Georg Wilhelm Friedrich Hegel (1770–1831), sought to develop a theory of law that would correct both the overly rationalistic character of Kantian jurisprudence as well as the overly empiricist character of

Savigny's "historical" approach. According to Hegel, Kant erred by failing to realize that the abstract, free personhood with which he *began* his "science of right" was not the pure, unhistorical personhood that he took it to be but instead only the *result* of a long, historical process of self-transformation through labor and social interaction. If Kant had understood the underlying logic of human self-transformation through labor and social interaction, he would not have been so firmly committed to the false and dualistic belief that the law's purpose can be only to make possible the conditions of free personhood, and not to promote social welfare. Karl Marx (1818–83) famously developed Hegel's thought to argue that the dynamics of labor and social interaction not only make possible free personhood and legality as they exist but also will bring about social revolution and emancipation in the future. Until that occurs, says Marx, law will continue to serve as an ideological instrument for the oppression of one economic class by another. In the twentieth century and beyond, Marx's ideological-critical assessment of the law has been adopted and transformed by many different legal theorists (e.g., proponents of critical legal studies, critical race theory, and feminist legal theory) who have argued that the law can serve in various ways as an ideological instrument for oppressing persons on the basis of class, race, and gender.

Lefort, Claude

Claude Lefort (1924–2010) played a major role in the revival of French political philosophy in the 1970s and 1980s. As a youth in Paris during World War II, Lefort studied with the philosopher Maurice Merleau-Ponty, whose phenomenological approach deeply influenced Lefort's political thought. In the early 1940s, Lefort was briefly involved with Trotskyist groups, but he quickly grew critical. With Cornelius Castoriadis, Lefort initiated a break from Trotskyism that led to the founding of the group and journal *Socialisme ou Barbarie* in 1948. As a member of this ultra-left libertarian group, Lefort opposed not only the Soviet Union and the French Communist Party but also fellow travelers like Jean-Paul Sartre. After years of fraught relations with Castoriadis, Lefort left *Socialisme ou Barbarie* in the early 1960s over disagreements about the nature and role of militant politics. Parallel to his political engagements, Lefort pursued a university career, teaching at several universities until his election to the prestigious École des Hautes Études en Sciences Sociales in 1976. In 1971, he completed a massive dissertation on Niccolò Machiavelli under the supervision of Raymond Aron. His preferred writing form is the essay, and many of his important texts are translated into three volumes, *The Political Forms of Modern Society: Bureaucracy, Democracy, Totalitarianism*; *Democracy and Political Theory*; and *Writing: The Political Test*.

A long-term critic of totalitarian regimes, Lefort gained prominence as a theorist of liberal democracy in the 1970s when many French intellectuals grew disillusioned with communism and Marxism more generally. Lefort's

mature thought centers on three major claims. First, the proper goal of political philosophy is not to understand “politics” as a particular sector of social life but to explore the “political,” which he defines as the basic framework that operates as the formative or generative principle of the social experience itself. Second, this framework is a symbolic construct: In contrast to Marxists, who would argue that power rests on a base of material relations, Lefort maintains that power functions only through representation. Third, and again in contrast to Marxism, division and conflict are ineradicable dimensions of social experience.

Lefort’s work is best seen not as an attempt to provide liberal democracy with new or renewed normative foundations but as an effort to identify the formative principles of democratic pluralism. This search leads him back to a basic position advanced by Alexis de Tocqueville: What is most important about democracy is not what it *does*, but what it *causes to be done*, namely, its power to arouse constant agitation in people. Democracy’s core lies not in a particular set of institutions acting in a certain way but in the open, indeterminate, and unmasterable process that democracy generates. Lefort traces this power of democracy to a “symbolic mutation” in the order of power. Earlier forms of society sought to conceal or overcome conflict through symbolic representations of power as a unity; so, for example, the early modern monarch symbolically incarnated the body politic in the unity of his or her body. In the struggle against monarchy climaxing in the French Revolution, power underwent a radical disincorporation in the name of egalitarian social relations. In Lefort’s famous formulation, the symbolic center of modern democratic power is a *lieu vide*, an *empty place*. Democratic power may be contested, and specific people exercise power. However, no one can permanently appropriate or incarnate democratic power, nor can such power be definitively represented. Democracy is, therefore, not a regime governed by fixed laws or an unquestioned legitimate power. Rather, it is a regime based on the legitimacy of a *debate* as to what is legitimate; and this debate is without any final guarantor or terminus. Totalitarianism is, in Lefort’s view, the modern counterpart of democracy because regimes like Nazism or Stalinism tried once again to conceal social division by reinvesting power in the symbol of the Nation, Party, Race, or Leader. Liberal democracy, by contrast, is an original form of society in which social division is the essence of its political logic. Once

the markers of certainty that situated people in relation to each other have been lost, the conflict of opinion and the debate over rights become interminable.

Basing his thought on the collapse of transcendent sources of political legitimacy, Lefort created an original and highly influential theory of democracy, which illuminates the nature of sovereignty, the role of symbolic representation in politics, and the dynamic expansion of civil and human rights in the modern democratic era.

Legitimacy

Legitimacy

494

495

Legitimacy

In the political context, legitimacy amounts to the governed recognizing the right of the governors to lead and, to a certain extent, their entitlement to the perks of power. It is a process through which both political power and obedience are justified. Yet, it is not as if the recognition of the right to govern is without constraints on those who govern. Conditions have to be met for the acknowledgment and justification of the right to govern—that is, for legitimacy—to develop. Three come to mind: First, those in power must deliver services to the governed. These services may vary from one society to another, from one period to another, but they are requirements that cannot be overlooked. Second, the services provided have to respond to and reasonably satisfy the key needs (of which security is an essential one) of the governed. These needs are themselves associated with the sense of the possible and the values (and the expectations they create) that are constitutive of the identity of society. As such, they are crystallized in the rights of people. Third, the needs/rights benchmark the responsibility and accountability of those in the position of command as well as of that of the political institutions, including the procedures of exercise of power and of how they oversee the general arrangements of society.

The emergence of democratic values in the second half of the eighteenth century and their increasing importance ever since have emphasized these elements as central aspects of modern political legitimacy. Today the perception of political legitimacy comes down to the distribution of power being seen as expressing, defending, and promoting justice, understood as

the fair allocation of, and access to, resources and opportunities (political, but also legal, economic, cultural, and others) resulting from relevant actors, with the attribution of rights and duties that comes with it. In this perspective, when political leaders and institutions, and the social system they underwrite, are viewed as unjust, and consequently illegitimate, it is not surprising that challenging social injustice and the political order becomes one and the same thing.

Authority being defined as legitimate power, and thus distinct from naked coercion, two contrasting dynamics of authority can be identified throughout history. First, when the legitimacy of leaders and institutions decreases and thus threatens the scope of authority, leaders are tempted to increase their use of coercion to maintain or restore their authority. But increasing coercion typically leads to further decreases in legitimacy, and thus, a downward spiral of legitimacy and authority ensues. By contrast, a second dynamic occurs in the absence of organized power, after a revolution, internal collapse, defeat in war, or natural disaster. In such a condition of chaos, those who newly assert their power and use it to provide for citizens' critical needs of survival and security are likely to win increasing legitimacy in the eyes of the people thus served. In turn, the new leaders' increased legitimacy is likely to further increase their power—and so on, in an upward spiral of increasing legitimacy and authority.

In neither of these dynamics, nor in general, should one infer that political legitimacy is without ambiguity or is pure. Nor should we believe that the relationship between power and legitimacy is a unilateral one, functioning to make power essentially positive because of the constraints political legitimacy imposes on it. History shows that regimes of legitimacy emanate from a position of power often initially acquired by brutal means, which, over time, through legitimization, the winners work on strengthening and perpetuating as much as possible vis-à-vis the losers. Although legitimacy (rightful rule) and accountability (popular control) tend to be associated, they should not be equated, and unaccountable, authoritarian regimes have often proved stable over long periods of time. The longterm, often tortuous process of legitimation makes the relations between legitimacy and power, on the one hand, and between legitimacy and justice, on the other, dynamic, tense, and complex. From a democratic perspective, the virtue and the

appeal of political legitimacy are to keep power under check by factoring in the rights of the governed. A continual challenge to legitimacy is its association with and closeness to power, which put it in danger of being captured by the self-serving dynamics of power, at both the national and international levels.

Historically, because international relations are anarchic, it is mainly in the national realm that the issue of political legitimacy has gained preeminence. This focus is also related to the fact that in modern times, starting with European societies, social integration and socialization have first and foremost taken place through the establishment of state authority at the national level. Max Weber, the emblematic analyst of legitimacy, roots it in tradition, legality, and charisma, while subsequent events suggest two additional, related but distinct, sources of political legitimacy: expertise (“We should govern because we are knowledgeable and talented”) and some concept of the Good (“We should govern because we stand for the purity of the Aryan race, or the will of Allah, or equal rights for all”).

In Weber’s view, there was nothing beyond or above the state, an assumption that excluded the theoretical possibility of international norms and institutions encouraging and allowing states to transcend their differences and thus achieve durable reconciliation of international legitimacy. However, from the primacy of national legitimacy, it does not follow that political legitimacy is absent internationally. The specific conditions of international relations generate major issues of legitimacy, especially in connection with the projection of power internationally and with international human rights. Issues raised by just-war theory and, in recent decades, the growing significance of democratic values as measures of international legitimacy illustrate this point.

501

Lenin and Leninism

Vladimir Il'ich Ulianov, better known by his revolutionary codename, Lenin, was born in the provincial Russian town of Simbirsk on April 22, 1870. He was born into a prosperous, privileged, and intellectual middle-class family. As a child, Ulianov/Lenin lived a cultured and warm family life. Perhaps the first question that arises, then, is why did Lenin later become a passionate revolutionary? Essentially, there are two overarching reasons. First, the antiquated social, political, and economic systems of Russia were no longer fit for purpose. By the 1880s, the crucial decade in Lenin's development, the government had turned to anti-Semitism and repression to maintain its authority. Increasingly, educated observers became alienated from it and looked to foreign models of democratic and law-based government as a necessary next step for Russia. By clamping down on civic freedoms, the autocracy created its own enemies and, by refusing any dialogue with them, turned them into extremists. A second factor was also important. The eldest of the Ulianov children, Alexander, became a revolutionary at the University of St. Petersburg. He was arrested; convicted of plotting to assassinate the current tsar, Alexander III; and executed in May 1887. It seems that this trauma, not surprisingly, fired up a visceral lifelong hatred of the autocracy in the young Lenin. The conventional child turned to his brother's radical literature and took the first steps to becoming the adult revolutionary. In particular, he encountered the utopian novel *What Is to Be Done: Tales of the New People* (1864), by the populist economist Nikolai Chernyshevsky, along with political luminaries

such as Karl Marx, Michael Bakunin, Alexander Herzen, and Vissarion Belinsky. He also read scientific literature. Charles Darwin was massively influential among the rising radical intelligentsia. Significantly, Alexander Ulianov had been studying biology.

The Evolving Revolutionary

In 1887, Lenin briefly left home to take up a place at the University of Kazan but was soon expelled in a political clampdown. Instead, he studied law by correspondence at the University of St. Petersburg, graduating at the top of his class in January 1892. His political activities soon outweighed his professional ones, and in the early 1890s, he affiliated with the social democratic wing of the revolutionary movement, writing his first known articles criticizing the populists and identifying workers rather than peasants as the revolutionary class of the future. He took a trip abroad to meet socialist luminaries such as Georgi Plekhanov, Karl Liebknecht, and Paul Lafargue in western Europe and returned ready to help found Russia's first social democratic organization, the St. Petersburg League of Struggle for the Emancipation of the Working Class in 1895. The group and Lenin's involvement with it were short-lived. He was arrested and sentenced to exile in Siberia, where he was joined by Nadezhda Krupskaya, who became his lifelong partner and wife. Ironically, Lenin's years of exile were among the happiest and most settled of his life. His perennial, often stress-induced nervous illnesses that peppered his later life were held in abeyance in these years. He was also able to write, producing his first major work *The Development of Capitalism in Russia*. A key problem for Russian Marxists was what was called the "backwardness" of Russia. For Marx, revolution was the outcome of the deadlock of advanced capitalism. In Russia, capitalism had hardly emerged. It was an important thesis of social democracy's populist opponents that Russia could avoid the epoch of capitalism and move directly to socialism because of the specific conditions within Russia, notably the existence of collective instincts and institutions such as the peasant *obshchina* (commune) and the worker and artisan *artel'* (collective work group). In *Development*, Lenin attempted to show the irrelevance of this debate by demonstrating that capitalism was already widespread in Russia and there was no chance of skipping the capitalist stage of development.

His release from exile in February 1900 was quickly followed by emigration to western Europe, where he spent all but two years until April 1917 living successively in London, Geneva, Paris, Krakow, Berne, and Zurich. In 1900, Lenin established the first of a series of newspapers that were the focus of his activities in exile. It was called *Iskra*, meaning “The Spark,” from which, implicitly, the wildfire of revolution would ignite.

In 1902 and 1903, Lenin took two decisive steps in his own self-definition. In 1902, he produced a pamphlet whose title, *What Is to Be Done?*, was borrowed from Chernyshevsky. In essence, Lenin argued that the working class, if left to itself, would only develop “trade-union consciousness,” which would make it content to strive for improvements extracted from capitalism when its underlying condition could only be alleviated by the revolutionary overthrow of the capitalist system as a whole. To promote revolution, there needed to be a central core of “professional revolutionaries” to lead it. He also argued that in Russian conditions, the revolutionary party should be conspiratorial. He rejected the argument that it should be open to make it accessible to the masses. Such a structure, he said, would make it “accessible to the police.” There has been extensive debate, then and now, about exactly what Lenin meant. Some have seen it as the foundation of Bolshevism, Leninist totalitarianism, and the centralized, one-party state. Others, however, point out that the work was initially welcomed within the social democratic movement and seen to be orthodox not heretical. Lenin’s example of “professional revolutionaries” came from the German Social Democratic Party, not from extreme, violent radicals. What Lenin was mainly advocating was a transition from the “intellectual circle” (*kruzhok*) mentality, which had hitherto prevailed among revolutionaries in Russia, to the formation of a regular political party. This led to the second step. At the Second Congress of the party, Lenin attempted to engineer a split that resulted in the formation of Bolshevik (majoritarian) and Menshevik (minoritarian) factions. Despite their names, the Bolsheviks were actually the minority until the second half of 1917 and the completeness of the “split” is questionable since there were regular attempts at reunification even in 1917. Henceforth, Lenin was not a subordinate member of a group but always the leader of his own faction and, eventually, party. In 1904, he wrote a further pamphlet, *One Step Forward, Two Steps Back*, the tone of which was more overtly anti-

intellectual and pro-workerist than *What Is to Be Done?* itself and, as such, is a repository of supposedly “Leninist” themes that are often associated with the earlier work but can scarcely be found in it.

In 1905, the long-awaited revolution broke out in Russia. However, Lenin’s actions and responses in the years of turmoil were surprisingly muted. He was content to observe the key events from afar and only returned to Russia in November 1905 when the revolutionary peak had already passed and repression was gaining the upper hand. Within four weeks of arrival, he was forced to go underground and spent the next two years in semi-concealment in the newly autonomous territory of Finland, from where he made occasional forays into St. Petersburg and beyond to speak, often in disguise, at rallies and the like. As ever, journalism was his main preoccupation and he continued to produce a prodigious number of articles. In December 1907, he decided to leave the Russian Empire once again and, at risk to his life, crossed heaving and cracking sea-ice, to evade surveillance and take the ferry from Finland to Sweden.

In the “decade of despair” (1907–17), Lenin remained in exile and occupied himself with developing his faction of the party, including promoting the most decisive break so far by calling his own party conference in Prague in 1912. However, his main activity was still writing and organizing newspapers, the most important being *Pravda* (“Truth”), which was founded in 1912 and went on to be the main party newspaper throughout and beyond the Soviet era. His ideas continued to evolve. For him, 1905 had emphasized the correctness of Marxist analysis that the working class would exercise “hegemony” over the political activities of the peasantry, who constituted some 90% of Russia’s population at the time. In the post-1905 period, Lenin’s analysis moved on to calling for a democratic dictatorship of the working class and the peasantry as a preliminary stage before socialism and, eventually, communism.

However, practical conditions were such that little room existed for political maneuvers and attention turned to a series of culture wars. Combating what he considered dangerous heresies in his own movement, Lenin wrote a philosophical treatise titled *Materialism and Empiriocriticism* in which he asserted the self-evident nature of the existence of objective reality outside

the perceptions of the individual. The argument was crude and polemical and contained little that has attracted the attention of serious philosophers either then or since.

Although horrified by the barbarism entailed, Lenin saw the outbreak of war in 1914 as a revolutionary opportunity. It was, he argued, to be turned from a war between nations into a class war that would result in the establishment of a republican United States of Europe. He joined the minority of European socialists, who had refused to support the war in their various countries, in efforts to bring about a “democratic peace.” He also continued to write and produced another important work, *Imperialism: The Highest Stage of Capitalism*. In it he analyzed the current situation in 1915–16 when he wrote and published it. In particular, he developed his view that the war was an imperialist war for profits waged between competing capitalist blocs. By forming powerful cartels and monopolies in key areas of the economy and by developing a powerful banking system, capital had become all-powerful in the main warring powers. It had permeated, even hijacked, the state, which had become its servant. It had also created “superprofits,” part of which was used to “bribe” some of the workers of the advanced countries into supporting capitalism. This implied that workers who were victims of imperialism would have to lead the resistance. Lenin had opened up the way to the wave of non-proletarian Marxist revolutions not only in Russia itself but also eventually in China, Southeast Asia, and to a lesser extent, Cuba. It helped Marxism become a preeminently anti-imperialist theory.

From Theory to Practice

When Lenin received the news of the collapse of tsarism in February 1917, his first thought was to return to Petrograd from Zurich. On arrival at the Finland Station in Petrograd on April 3, Lenin immediately read out ten theses that were to guide his action in 1917. In little more than two pages, these so-called April Theses encapsulated Leninism. Among the most important were the assertions that Russia was passing from the stage of bourgeois revolution to that of proletarian revolution; that gradual and patient work was needed to assist this process; that the police, army, and bureaucracy should be abolished; that banks should be amalgamated and

nationalized; that it was not the task of the party to “*immediately*” “*introduce*” socialism (Lenin’s emphases) but only political supervision of production and distribution; and most controversial of all, that there should be no support for the interim, liberal-oriented Provisional Government. In this crucial document, many aspects of Lenin’s thought come to the fore, notably his theory of stages adapted from Marx; his refusal for the time being to call for an immediate transition to socialism in favor of an intermediate stage of an increasingly politically regulated capitalism; and for the moment, no indication as to whether the new “stage” would last months, years, or decades. His recipe for government via soviets rather than a parliament was expanded in his last, great work written later in 1917 titled *State and Revolution*, in which the fundamental argument was that the operations of a modern capitalist economy had become so managerial that it could be controlled by decapitating it—that is, by taking over the banks. From this substantial bridgehead, the capitalist economy could be transformed into a socialist one, although there are no details on exactly how it might be done. By and large, Lenin assumed the natural wisdom of the working class, expressed through soviets, would instinctively work out the details. In particular, their “consciousness” would pull them through, especially since the main role of the party was to develop and raise class consciousness. The second major theme of *State and Revolution* was the replacement of a bourgeois, constitutional state structure and representative democracy with the more direct and participatory form of soviet democracy.

State and Revolution remained unfinished because Lenin was called away from yet another period of hiding to promote the October Revolution and establish himself in power. How did this dramatic transition come about? As late as July 1917, when a premature attempt by revolutionary military units in Petrograd to seize power was repulsed by the Provisional Government, the Bolsheviks were still a relatively small and marginal entity. Ironically, the fact that the Provisional Government blamed the Bolsheviks for the failed July Days helped single them out as the group most feared by the government. Unsubstantiated accusations that Lenin was a German agent did temporarily tarnish the party, but their impact soon wore off. Two further factors were decisive in propelling the Bolsheviks into power. First, by refusing to support the Provisional Government, they were the largest party of the left to remain outside its framework. As the

popularity of the government declined, so the Social Revolutionaries and Mensheviks were pulled down with it. Minorities split off and began to move closer to the Bolsheviks. The second factor was the attempted military takeover of the Provisional Government in late August and September by the commander-in-chief of the army, General Kornilov. The abject failure of Kornilov's enterprise galvanized the masses into defense of their interests over land, factories, and civilian and military soviets bringing a massive boost in support to the Bolsheviks and their new allies, which Lenin was determined to exploit by driving for a seizure of power that succeeded on October 25, 1917. From that day until his death, Lenin was the informal head of the Soviet state as well as the ruling party. It should be noted, however, that the party had come to power through contingent factors and clever short-term actions *not*, as Lenin himself believed, through a steady and widespread accumulation of class consciousness among workers. This anomaly left a major imprint on communist practice as successors attempted to implement a "Bolshevik" model that had not been applicable to the October Revolution itself.

Lenin's main focus in these years was to lay the foundations of the world's first socialist society. The actual historical conditions of the time were, to say the least, inauspicious. At the moment of takeover, Russia was embroiled in an already protracted and costly war that, given the new turmoil after the revolution, threatened Russia with invasion. In addition, a civil war against the old order developed as did a crucial internal struggle by which the Bolsheviks consolidated their initially tenuous hold on power. By 1921, they had broken their opponents but at a tremendous cost. Russia's industrial economy had collapsed, and the country's infrastructure was ruined. Nonetheless, Lenin's focus was on socialist transition.

In effect, early Soviet Russia underwent three attempted forms of transition to socialism. The first, already outlined in the *April Theses* and *State and Revolution*, was that of a supervised coercion of the capitalist economy into a socialist one. This naïve notion collapsed like a house of cards in the first six months of Bolshevik rule. None of the key actors played their expected role. Workers and peasants put survival ahead of transition, and the capitalists and state bureaucrats fought tooth and nail against the new authorities. Lenin was forced into a rethink that took place in March and

April 1918 and found expression in his major article *The Immediate Tasks of the Soviet Government*. In place of loose supervision and local spontaneity, Lenin put the emphasis on “iron discipline” and “dictatorship” at the factory level as a necessary prerequisite for recovery. This was backed up by a new emphasis on political coercion to the point of terror, which became even more intense in August 1918, partly in response to Lenin being shot and seriously injured. Crucial to this second transition was the notion that only when economic production was in full swing could the emergence of socialism be contemplated. This meant that increasing production was the first and main task of the Soviet government. In many respects, this remained true of successive governments throughout the Soviet era, and in a sense, productionism was the highest stage of Bolshevism. However, after only three years, Lenin was forced by peasant resistance to rethink this position. Faced with grain shortages from 1918 because the peasants were not marketing their produce, since there were no industrial products or services to buy with the proceeds, the government resorted to forced requisition. Although the peasants were partially prepared to accept this during the war and civil war, its continuation beyond victory in the civil war (in essence achieved by the end of 1919) led to serious revolts against Soviet power in western Siberia and Tambov in 1920 and the naval base at Kronstadt in early 1921. A further model had to be thought up. This took the form of the New Economic Policy (NEP) based on a mixed economy in which the state controlled “the commanding heights” of banking, finance, heavy industry, transport, and foreign trade, but limited markets were permitted for agricultural products, some services, and small-scale collective, workshop-style, or artisanal production. Lenin was satisfied with this compromise and expressed high hopes in his last writings such as *On Co-operation* and *Our Revolution* that they had stumbled on the perfect transitional model.

He did not live long enough to see NEP beginning to unravel in the mid-1920s. He was increasingly ill after May 1922 when he had the first of a series of strokes that increasingly incapacitated him. Speculation abounds that had he not been ill he would have curtailed the career of Stalin, but be that as it may, it was Stalin who eventually came to power after him, wound up NEP, and returned to a model that much more resembled the iron proletarian discipline and terror of the 1918–20 model. Lenin spent his last

two years on the sidelines. He made a last poignant visit to his old office in the Kremlin in October 1923, a visit that almost foundered because the guard, who failed to recognize him, would not let him in because he did not have a valid pass. Three months later he died, on 21 January 1924. Against his wishes, his remains were embalmed and put on display in a mausoleum in Red Square where they still are at the time of writing.

From Lenin to Leninism

While Lenin was alive, there was no Leninism. The Party Program (1919) and the documents of the Communist International, notably, its 21 conditions for admission, were early manifestations of an attempt to generalize the experience of Russia into a widely applicable theory of revolution in its two key phases—overthrow of the existing order and construction of a new system—linked by the crucial moment of “transition.” Gradually, several key features began to crystallize out of the discussions.

First of all, of course, Lenin was a Marxist and subscribed to Marx’s theory of class struggle, with exploitation as its central nexus, forming the basis of human history. Under capitalism, the struggle between worker and bourgeois employer would, of itself, lead the workers to revolution. However, Lenin’s ideas took on a somewhat different shape. The firm foundation of a distinctive Leninism is the notion of, in Stalin’s words, “a party of a new type.” This was usually referred to as a vanguard party having three identifying features. First, it would have what was later described as a “leading role,” in the revolution first and in post-revolutionary society afterward. Second, it would be organized on the principle of “democratic centralism,” which meant in theory that party members were free to hold different opinions but that once a decision had been reached, all party members had a duty to implement the decision and cease all opposition to it. In practice, decision making was concentrated at the top of the party. Third, the party was made up of militants with “advanced class-consciousness” and a primary duty of the party was to “raise consciousness” by means of agitation and propaganda. In addition, a party morality evolved based on the conviction that revolutionary ends

justified a wide range of means, some of which were cruel, harsh, and dictatorial.

A second widely influential aspect of Leninism is the fact that, through the notion of imperialism, revolution became international and could be started (although not finished) at a point outside the leading capitalist nations. This altered the orthodox Marxist assumption that revolution would break out first in the most economically advanced countries. Lenin's notion opened up a whole new vista for Marxism as the fighting doctrine of radical movements among the worldwide victims of imperialism.

Popularization of the term *Leninism* and the heaviest imprint on its initial formulation came from Stalin, who was among the first to use the term and define its contents in a series of lectures published in 1924 titled *Problems of Leninism*. Mainstream definitions of Leninism, which became known as Marxism-Leninism and was enshrined as the official ideology of the Soviet system, were produced through increasingly Stalin-controlled bodies such as the party and Comintern. Not surprisingly, in this dominant form, it became almost as much "Stalinism" as "Leninism." Dissident communists who opposed Stalin, notably Trotsky and Bukharin, tended to turn to the alternative models of a more "democratic" and antibureaucratic Lenin of the *April Theses* and *State and Revolution* in the case of Trotsky and his followers, or the provisions of the New Economic Policy for Bukharin. In essence, then, there were, from early on, competing interpretations of Leninism. They shared a number of key elements, especially when it came to the role and nature of the party and the question of consciousness but differed over, for example, exactly how "productionist" goals should be achieved. Trotsky favored regimentation, central planning, and discipline imposed from above, not unlike Stalin himself on this question, while Bukharin defended a model more dependent on a regulated market than on direct coercion.

Much of Soviet and postrevolutionary politics in other self-proclaimed Marxist-Leninist states have revolved around this key issue. In China, a "voluntaristic" transition modeled on Stalin's policies of 1928–32 ran through the Maoist period from the inauguration of agricultural communes, through the Great Leap Forward, to its grotesque finale in the Great

Proletarian Cultural Revolution of 1966–76. In Cuba, Che Guevara and other supporters of “moral” incentives based on education, propaganda, and political pressure were in conflict with the Castro brothers, who advocated “material” incentives such as bonuses and promotions. The most tragic misapplication of a derivative of the Leninist models came in Kampuchea, where the ideologically driven attempt to achieve national economic independence by cutting ties with the outside world led to the forced evacuation of the overpopulated capital Phnom Penh, resulting in tens, maybe hundreds, of thousands of deaths. Thus, although Leninism has been associated with a centralized, disciplined party tolerating no dissent, the further application of its principles of dictatorship of the proletariat, productionism, and other aspects of socialist transition have led to wide disparities in Leninist movements.

Liberalism

Liberalism is most associated with government by consent, human rights, constitutionalism, the separation of powers, freedom of speech and belief, and a tendency to favor incremental change or reform. In one form or another it is both the dominant ideology of Western nations and the basic creed of such global institutions as the United Nations.

The Emergence of Liberalism

Although elements of liberalism appear as early as in Aristotle's *Politics*, modern liberalism emerged gradually from political demands made in the medieval period, either against the monarch or against the government more generally. Thus, the Magna Carta (1215), although an agreement merely between the English king and his barons, implied constraints on the power of the king. Similarly, the medieval coronation oath often indicated reciprocal obligations between the monarch and the people. The oath was often a form of governmental contract in that the king's authority was not accepted unless he bound himself to provide just and good government. This use of contract as the basis for possible popular resistance to a tyrannical government is most frequently associated with John Locke in the seventeenth century but was already apparent in the writings of Manegold of Lautenbach in the eleventh century.

Early liberalism is associated with the notion of social contract, popular in the seventeenth and eighteenth centuries, and most famously used in the political theories of Thomas Hobbes, Locke, and Jean-Jacques Rousseau. Its individualist postulate is that humans existed before society, and so the individual comes first logically and sometimes, as with Locke, historically. Humans were presumed to have created their own society on the basis of rational consent. The contract is a voluntary agreement of those who will be bound by the rules of the system they establish. In this formula, we see the emergence of later notions of individual freedom and the self-determination of peoples.

Locke argued for individual rights, the sanctity of property, and government by consent and, like Hobbes, attacked the idea of the divine right of kings. He followed John Milton in the view that society is based on contract but government rests only on trust. In this way, the government was a servant rather than an equal of the people, who had a right of resistance should the trust be broken. In such writings, we clearly find the early seeds of liberalism, even though they were sown by people who had no intention of producing what eventually resulted. Thus, for Locke, explicit consent was assumed to be granted only by those who first set up the contract. For all later generations, tacit consent was assumed by their staying on the territory, using its currency, and reaping its benefits. So consent need not imply democracy even if it seems to have democratic implications. It all depends on precisely whose consent is presumed or requested and how it operates. Similarly, Locke wrote a famous essay on religious toleration, an important step forward, but granted only to Protestant churches and sects and not to Catholics or atheists.

Enlightenment and Revolution

The rise of modern liberal thought is inextricably linked to the eighteenth-century Enlightenment and its inspiring of progressive change. Although sometimes traced back as far as the 1670s, it has been associated most centrally with the famous French *Encyclopaedia* edited by Denis Diderot and Jean D'Alembert between 1751 and 1765. Basic to the whole movement was the attempted application of rationality to traditional norms and institutions, with the implication that they might be changed for the

better. In the 1780s, Immanuel Kant argued that only those institutions could be respected that had withstood free and open examination, but rational enquiry, to be effective, needed an environment of tolerance and permission to develop one's ideas wherever reason might lead. This notion is exactly what established states and religions had traditionally opposed. Little wonder, then, that both Voltaire and Diderot, like Locke before them, wrote treatises on toleration. Most Enlightenment thinkers were liberal in respect of openness and free thought but much less so in terms of political participation. There was, however, a more radical tendency, including Jean-Jacques Rousseau, Thomas Jefferson, and Thomas Paine, who valued citizenship and political participation.

As the area of European culture where new political systems were being established, it was in North America that emergent liberal theory could most easily be put into practice. The background to European emigration was the pursuit of a religious freedom that had not been available in the countries of origin. On fleeing to North America, persecuted religious minorities became not merely religious communities but also political ones; they became their own state in the same manner as they were already their own church, that is, by voluntary agreement. So the foundational documents of the United States of America—the Declaration of Independence of 1776 and the Constitution that became operational in 1789—are monuments to eighteenth-century liberalism. The Declaration is based on the notions of natural rights, political representation, and the right to resist tyranny. The act of producing a written constitution is a product of the rationalism of the era. The liberalism in the content is most marked in the attempt at federalist decentralization, the separation of powers, and the separation of church and state. Unlike any European regime of the period, the U.S. government had no hereditary or ecclesiastical offices. In 1791, a Bill of Rights was added to the Constitution. Its first article stated that:

Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assembly, and to petition the Government for a redress of grievances.

The Constitution originally said nothing on voting rights, so the political system became more fully liberal, in terms of democracy, when black and female voting rights were won, in 1870 and 1920, respectively. The sense of principles acknowledged but not yet fully applied is powerfully apparent in the most famous political speech of the twentieth century, when Martin Luther King, Jr., in “I Have a Dream” (1963), called on the government to fulfill the true meaning of the country’s creed.

A statement of human rights was also drawn up in France in the month after the revolution of July 1789. Along with the inspirational trinity of “liberty, equality, fraternity,” it proclaimed the rights to property, security, and freedom of opinion. An axiom of the revolution that is basic to liberalism is the career open to talent. Inspired by the life of Abraham Lincoln, the American version of this vision became “From log cabin to White House.” Liberalism, then, is an ideology of equal opportunities. It requires that the leading positions in any society should be attainable by merit alone, and not, as in the aristocratic principle, defined by birth as the fundamental qualification for power and authority. The French revolutionaries saw their basic enemy as being the aristocracy, with whom they dealt in a most illiberal manner. They also imprisoned Thomas Paine, British-born but actively engaged in both the American and French revolutions. His *Rights of Man* (1791–92) became one of the foundational liberal texts of the period, which he saw as one of both reason and revolution. Paine believed that the new American republic would provide a model that would be rapidly copied elsewhere. He was greatly impressed with the Americans having a written constitution. Without one, he argued, a government has full legislative freedom, for good or ill, during its period of office. Where there is a constitution, legislative powers are curtailed, the people maintain their basic rights, and so tyranny becomes impossible. Paine thought that America had done everything right and that England had done everything wrong. The British class system perpetuated the division created long ago by the Norman conquest of 1066, while the British state system impoverished society, for it gathered around the throne a band of parasites living off public money. Paine mocked the principle of inheritance by which the monarchy and aristocracy operated, asking whether we would also like to have hereditary mathematicians or poet-laureates. If the people reclaimed their basic rights, he believed, it would be possible to have both cheaper

government and rudimentary welfare provisions for the poorest. In this way, he was a forerunner of the “new liberalism” of a century later.

The Nineteenth-Century Consolidation

The French revolutionaries granted citizenship to a number of foreign radicals. One such was Paine, a supporter of their revolution; another was Jeremy Bentham, who was not. It might now seem strange that Bentham was a liberal, yet he derided the notion of natural rights. He believed, however, that he had found a better alternative in the principle of utility. He took it as a fundamental characteristic of human nature that people pursue happiness and avoid pain. These preferences were to be subjected to a kind of utilitarian accountancy to ascertain whether any proposed action was likely to increase or decrease the greatest happiness of the greatest number. In early nineteenth-century Britain, the fortuitous advantage of this approach was that it provided a criterion for reform that avoided a human rights doctrine then too closely identified with the French Revolution. So Bentham became a great influence on numerous British reformers as well as on Prime Minister Sir Robert Peel. Bentham was also an indefatigable campaigner for constitutional reform, sending offers to draft or redraft constitutions to, among others, the Tsar of Russia and the President of the United States. Even more ambitiously, he made a “Codification Proposal . . . to All Nations Professing Liberal Opinions.” Bentham’s advice was sought from many countries, especially in South America, when, after independence from Spain, new constitutions were being drafted in Argentina, Chile, Colombia, Guatemala, and Mexico. In Argentina in the 1820s, President Rivadavia became a disciple of Bentham. A later prominent Argentine liberal was Domingo Sarmiento, who admired the American constitution, opposed the idea of a state religion, and advocated toleration of all opinions. In *Civilization and Barbarism* (1845), he campaigned for European liberal civilization and against the Argentine gaucho warlords.

James Mill was a friend, neighbor, and popularizer of Jeremy Bentham and brought up his more famous son, John Stuart Mill, to be the carrier of utilitarianism for the next generation. This plan presumed the son’s compliance with the creed, but acquaintance with Samuel Taylor Coleridge,

Wilhelm Humboldt, and other thinkers and poets of the Romantic movement led Mill to adopt a broader outlook. He also had to meet the claims of critics that utilitarianism had too narrow a view of human nature as selfish and competitive. Mill's answer, in *Utilitarianism* (1861), was that individuals should be strictly impartial between their individual desires and the needs of others. In terms of Bentham's calculus of happiness, Mill argued that the tabulation of quantity was insufficient and that the quality of happiness should also be taken into account.

Mill's *On Liberty* (1859) is now regarded as the most significant text of classical liberal political theory. Mill argued that the conditions of modernity created dangers to liberty that were insufficiently recognized. People did not need telling that kings could be tyrannical and churches intolerant. Less recognized was the new danger posed by the intolerance of mass society, a lesson Mill had learnt from Alexis de Tocqueville as well as from a hostile public opinion, disapproving of his "scandalous" relationship with then-married Harriet Taylor, whom he later wed after John Taylor's death. This threat to individuality not only stunted human nature, but it also threatened societal development and so civilization itself. Mill instanced the case of China, which had previously been in the forefront of development but became a global backwater once free thought was curtailed and conformity demanded. To defend individuality, Mill asserted the basic principle that only the threat of harming the rights of others could justify the state's interfering with anyone's liberty of action. This position presumed that one could differentiate between self-regarding and other-regarding actions, a distinction generally viewed as less clear-cut than Mill hoped. Despite the qualms of critics, he succeeded in establishing freedom of speech as a critical defense of individuality. In addition, his "harm-to-others" limitation on liberty, especially liberty of action, has also won widespread support, among both conservatives and liberals.

The issue of liberty was also central to Mill's position in *The Subjection of Women* (1869), where he argued that liberty was unjustly denied to half the species. Women's inferior legal status was a notorious surviving instance of the law of the strongest, an outdated practice that, he believed, should be rejected. Mill regarded the power of the husband as similar to that of the aristocrat in enjoying benefits based on birth rather than on merit. In each

case, such a basis of power corrupts the beneficiary and degrades the victims.

The classical version of economic liberalism is that it gives overwhelming priority to the free market. The traditional liberal suspicion of the state here results in the demand that it be confined to the minimal functions of keeping law and order, external defense, and a stable currency. The economy is presumed to work best when it is self-regulating, stabilized by a serendipitously guiding “invisible hand,” as Adam Smith put it in *The Wealth of Nations* (1776). Smith, Thomas Malthus, David Ricardo, and James Mill are regarded as the most influential theorists of classical economic liberalism. John Stuart Mill was brought up to be a proponent of this doctrine, which he tried to follow, but in his *Principles of Political Economy* (1848), he found, rather against his inclinations, that modifications of the doctrine were increasingly necessary, for in addition to law and order and a stable currency, it was also necessary for the state to provide standard weights and measures, roads, and canals. The state should also enforce education, ensure that children were safeguarded, and provide for the care of the mentally ill. Economically, it might also be necessary to protect infant industries.

In its economic aspect, classical liberalism is often regarded as the ideology of the property-owning classes, of those that could fend for themselves, the emerging middle class of entrepreneurs and businessmen for whom state regulations imposed a curb on their economic activity. This view, however, has varied both by country and over time. In the nineteenth century, the notion of global free trade obviously best suited Great Britain, the country that had industrialized first and so dominated world trade. By contrast, liberal industrialists in other countries had a greater interest in protectionism. In his *National System of Political Economy* (1841), the German liberal Friedrich List argued that economically backward countries needed state support and protection until they were sufficiently developed to compete in the world market. Even in Britain, free-market ideas came under greater challenge with the rise of industry elsewhere, particularly in the United States and Germany, by the end of the nineteenth century. Global laissez-faire is the natural economic ideology of the dominant economic power. It suited Britain when she was and less so when she was not.

Liberalism and the Working Class

Around the middle of the nineteenth century, parts or all of the male working class already had the vote in the United States (where each state determined its own franchise), France (1848), Prussia (1849), and from 1867, Great Britain. Liberals supported the idea of representative government but also favored rationality and the security of property, which working-class voting might endanger. So liberals' old concern with the class above was gradually subordinated to unease with the class below. Liberalism's first reaction to the political threat from below was to resist it. The belief in government by consent was taken to mean the consent of the rational, the educated, the property owners, not the consent of all. In his *Considerations on Representative Government* (1861), John Stuart Mill recommended educational qualifications for voting and proportional representation as a way of protecting minorities.

A more significant reaction, in terms of liberal theory, was to acknowledge the grievances of the poor in industrial societies—that capitalism had made them free but at the same time had reduced their life chances. Critics of capitalism, from socialists such as Karl Marx to Southern aristocrats such as George Fitzhugh, increasingly charged that freedom, choice, and well-being were diminished for those in poverty. Paradoxically, the unregulated free market was *reducing* the freedom and life opportunities of the working class. As the disenfranchised majority of poor white males, followed by men of color, and then women won the right to vote, conservatives could no longer rely on the state to support the socioeconomic status quo that had historically privileged white male property owners. Having previously resisted a strong government, liberals began to invite the state back in as the obvious institutional base for ameliorating the lot of the disadvantaged.

Influential theorists of this “New Liberalism” include the Englishmen Thomas Hill Green, who brought to liberalism a stronger concern with community; John A. Hobson, who urged the modification of laissez-faire economics; and Leonard Trelawny Hobhouse, who argued that inequality diminished freedom. In the United States, the new liberalism found persuasive advocates of an activist state in the vigorous President Theodore Roosevelt's top idea man, Herbert Croly, and in Roosevelt's distant cousin

President Franklin Delano Roosevelt, who oversaw the New Deal in response to the Great Depression, in large part inspired by the trust-busting, populist model of his cousin and predecessor. What these new liberal British and American thinkers and practitioners had in common was their commitment to using the state to improve the opportunities of the disadvantaged and to actively guide the society toward the common good, rather than leaving these outcomes to the vagaries of an untrammelled free market.

This type of liberalism seemed within fingertip reach of socialism and so, unsurprisingly, encountered some resistance, most notably in Englishman Herbert Spencer's *The Man versus The State* (1884) and American William Graham Sumner's *What Social Classes Owe to Each Other* (1884). Both Spencer and Sumner believed that liberals had not been true to their core beliefs and had, in Britain and the United States, promoted a massive increase in governmental control. They disliked the new mentality whereby the state was expected to be the savior of everyone's problems. As a result, the successful were having to featherbed the unsuccessful and idle. The presumed natural law of social development, the survival of the fittest, was thereby undermined, to the great detriment of social progress. Spencer and Sumner represent a stark form of the antiwelfare strand of liberalism. Where equal opportunities are assumed to exist, some liberals, including Locke and J. S. Mill, assumed that the poor were lazy and irresponsible and therefore undeserving of help. In the United States, although Franklin Delano Roosevelt's New Deal permanently enlarged the role of the U.S. government, new forms of Social Darwinism, influenced by both Spencer and Sumner, have continued to pose serious problems for the new liberalism of the Democratic Party and for Democratic presidents such as Bill Clinton and Barack Obama.

Liberalism Against Authoritarianism

The belief in equal human rights logically should have produced full liberal endorsement for female enfranchisement. That development, however, had to contend with the traditional assumption of separate spheres, that public life was the preserve of men and home life that of women. That pattern was disturbed by World War I when women filled the employment gaps left by

enlisted men. Women's claims to full citizenship were thus considerably enhanced, and by 1920, they had won voting rights in all of North America and most of Europe. Defeated Germany had replaced the Kaiser's Empire with what was probably the most liberal constitution in the world. The League of Nations had been set up to arbitrate disputes between countries, and thus, liberal ascendancy seemed to have been achieved. It was a false dawn, however, for the 1929 Wall Street collapse led to economic depression in many Western countries and contributed to the rise of Nazism in Germany, which, with fascism in Italy and communism in the Soviet Union, represented a powerful and threatening authoritarian alternative to liberalism.

After World War II, widespread decolonization furthered the liberal principle of self-determination of peoples, while the United Nations Declaration of Human Rights proclaimed liberal beliefs as those by which all countries, whatever their practices, should attempt to justify themselves. Liberalism now came to be seen less as a particular ideology than as undogmatic common sense, seeking to preserve what is valuable and reform what is deficient. For a time, a theory of the end of ideology, advanced by thinkers such as Daniel Bell, won considerable intellectual support. Ironically, triumphant liberalism was not reflected in the revival of explicitly liberal political parties, whose partisan appeal was much reduced by the co-optation of their ideas across the whole democratic spectrum. Yet the various components of the liberal legacy were not equally strongly integrated in the West. The parts given most prominence related to government by consent and freedoms of speech and conscience. Economic free-market liberalism had articulate campaigning popularizers, such as Friedrich Hayek and Milton Friedman but, until the late 1970s, was widely dismissed as anachronistic. Politicians holding such classically liberal views now tended to be regarded, and indeed saw themselves, as conservatives, most prominently Barry Goldwater and later Ronald Reagan in the United States, and Enoch Powell and Margaret Thatcher in the United Kingdom.

Hayek was born in Vienna but became a British citizen in 1938. His *The Road to Serfdom* was published in 1944. He feared that while fighting Nazism, the British were actually succumbing to the mentality that had produced it, for they were increasingly scornful of nineteenth-century

liberalism. He noted that individualism had unfairly become associated with selfishness. Meanwhile the predominant strand of the British Labour Party seemed unaware of the extent to which central planning tends to produce creeping authoritarian rule (“totalitarianism” to some). For Hayek, to control people’s lives, even in the name of some utopia, is to destroy their freedom. He portrayed economic planning as an intrusion by the state into the most important areas of decision-taking. In a planned society, individuals are the passive recipients of policy rather than the active creators of their own situation. Planning leads to an over-dominant state because it centralizes power, whereas the competitive society decentralizes it. The market system, then, is taken to guarantee diversity and choice and, therefore, liberty. It is the only method by which individuals’ activities can be coordinated, as by Smith’s “invisible hand,” without organizational intervention.

As with Hayek, Isaiah Berlin’s writings are also marked by a hostile reaction to German Nazism and Soviet Communism. Berlin was born in Riga, Russia, in 1909; was in Petrograd during both 1917 revolutions; and moved to England in 1921. He argued against any utopian notion of an ideal society because ends collide and so choices have to be made between them. He formulated a much-discussed distinction between negative and positive liberty. Negative liberty is identified more with the absence of constraint, and positive liberty more with obedience to natural law and reason. They lead, Berlin thought, in radically different directions. The notion of negative liberty provides the basis for the liberalism of Jefferson, Burke, Paine, Constant, and Mill, while positive liberty leads from Rousseau to Hegel, Marx, in the direction of totalitarianism.

Recent Debate

John Rawls’s *A Theory of Justice* (1971) is arguably the most influential work of liberal philosophy of the twentieth century, attempting a bold new synthesis of liberty and equality. It contains a surprising reemergence of social-contract theory, not on the basis of a state of nature that actually existed but for the positing of a hypothetical situation to determine what would make a just society. Rawls hoped to get around the problem of individuals’ biases by providing a “veil of ignorance” (Rawls [1971]1978,

136–42) over individuals presumed to possess rationality and political and economic knowledge, but, crucially, not knowing their own place in society. The outcome is presented as a constitutional democracy that has usually been identified as a relatively egalitarian form of liberalism, even though Rawls allowed for justifiable inequalities and left open the choice between capitalist and socialist economies. Despite his popularity among liberal political theorists, Rawls faced a barrage of criticisms and, a generation later, conceded that his general theory of justice as fairness had failed: “The fact of a plurality of reasonable but incompatible doctrines—the fact of reasonable pluralism—shows that as used in *Theory*, the idea of a well-ordered society of justice as fairness is unrealistic” (1995, p. xvii). Rawls (1995) retreated to a procedural, rather than to a substantive, conception of liberalism, although he also attempted to shore up his original, substantive vision (1971) in later editions.

Another surprising reemergence was the theory of universal history in Francis Fukuyama’s *The End of History and the Last Man* (1992). The work has a strong affinity with the main presuppositions of eighteenth- and nineteenth-century European social and political thought, for Fukuyama revived the idea that the course of history moves in a coherent, logical, and upward direction. He took as universal the process of history toward industry and liberal democracy. Furthermore, liberal democracy is taken to be more than just the currently dominant creed; it was additionally the end point of humanity’s ideological evolution. There could be no further hegemonic idea.

Fukuyama’s book was written just after the fall of Soviet and East European communism and so represents the high point of liberal triumphalism at having seen off its main competitors. That “triumph,” however, is not the end of the matter. Some feminists, for example, argue that liberal notions of the “individual” and the “citizen” are implicitly masculine rather than gender-neutral. Multiculturalists have discussed the awkward issue of whether liberal tolerance should extend to ethnic minorities with intolerant creeds. John Rawls has justified the imposition of human rights on so-called rogue states, thereby reminding us of nineteenth-century liberal imperialism. In *Post-Liberalism* (1993) and *Two Faces of Liberalism* (2000), John Gray rejected liberalism’s claim to universal authority, its

theory of progress, its notion of the atomized individual, and its assumption that all human beings are entitled to the same stock of rights. He sees liberalism as a Eurocentric creed that is ill-equipped to deal with the world as it now is. Clearly, then, the debate on liberalism is far from over.

Liberation Theology

Liberation theology, a movement linked with social change, arose at a time of political repression in Latin America and coincided with the ferment in the Roman Catholic Church after the Second Vatican Council and the encyclicals associated with it. In its distinctive method, it has many affinities with feminist theology, black theology, and various kinds of contextual theology.

The wider ecclesial context has also been important. The decisions taken by the Latin American bishops at their epoch-making meeting at Medellín, reaffirmed at Puebla with the explicit commitment to take a “preferential option for the poor,” have offered a foundation for those Christians committed to the betterment of the poor to see their task as an integral part of the church’s mission of evangelization. Liberation theology has emerged within the development of modern Catholic social teaching as its exponents have responded to the “reality,” which confronts millions: poverty, appalling living conditions, malnutrition, and inadequate health care. In the Roman Catholic Church, the power of diocesan bishops is such that attempts to get the grassroots movement off the ground without episcopal support have found the going tough indeed, even though the social conditions of large numbers of people may be every bit as bad as in other dioceses where the theology has taken root. But in those dioceses where the diocesan bishop is supportive, that power can be used to push a diocese in a progressive direction.

The particular circumstances of the church in Brazil in the 1970s and 1980s offered a context for the development of liberation theology, which has been unique in Latin America. Brazilian Catholicism is characterized by a widespread acceptance of the basic ecclesial communities (CEBs) and their central role in being the church in contemporary Brazil. The power of the Brazilian Bishops' Conference nationally and in the context of Latin America and the development of liberation theology in the face of Vatican criticism cannot be underestimated. In the Archdiocese of São Paulo, for example, the advocacy of the Cardinal Archbishop, Paulo Evaristo Arns (1921–), was crucial both locally and nationally in supporting pastoral programs, whose tenor was liberationist. Thereby an agenda was set for an innovative theological and political enterprise, which placed the struggles of millions for a better life at the center of pastoral ministry. In this, it was totally in line with the manifesto-like statement of *Gaudium et Spes*, a key document of the Second Vatican Council: “[T]he joys and the hopes, the griefs and the anxieties of the [people] of this age, especially those who are poor or in any way afflicted, these are the joys and hopes, the griefs and anxieties of the followers of Christ” (Walsh and Davies 1991, 77).

Liberation theology was part of a more widespread popular movement in different countries, for example, *O Movimento de Sem Terra* in Brazil (Lehmann 1996). In Nicaragua, its leading exponents were key members of the Sandinista revolution, which swept the Somoza dictatorship from power in 1980 (Berryman 1984; Bradstock 1987). In that country, as elsewhere, relationships with the Roman Catholic Church remained tense, particularly when three priests became part of the government. One of them, Ernesto Cardenal, was part of a peasant community on the island of Solentiname, and the transcripts of the Bible study (*The Gospel in Solentiname*) give a flavor of liberation theology at work. It represents the more important dimension of liberation theology, the work of priests, members of religious orders, men and women, with campesinos and immigrants into the burgeoning shanty towns on the periphery of big cities in most Latin America countries.

More familiar to the Northern academy are the books written by Gustavo Gutiérrez, Juan Luis Segundo, and Leonardo and Clodovis Boff, in which the traditional language of theology was used as part of an ongoing

dialogue with mainstream Roman Catholic theology, political and otherwise, throughout the world. In this, the indebtedness to “Marxism” is entirely pragmatic and assists in the challenge to institutions, like the Roman Catholic Church, to opt for the economically poor and marginalized and at the same time to encourage personal and political empowerment by education, which includes a critical understanding of the existing social situation, as well as facilitation efforts to organize for ongoing political change.

Key to this movement from its inception has been the Peruvian theologian Gustavo Gutiérrez. Unlike Camilo Torres (1929–66), who died in an armed struggle with the Colombian army, Gutiérrez followed a different path. Torres has strangely become a symbol of liberation theology, but his theology and practice was as different from that of Gutiérrez as could be imagined; it was much less sophisticated, and the commitment to armed struggle is one that is untypical of liberation theology. It is true that the progressive wing of the churches in Nicaragua, Protestant and Catholic, supported the Sandinista revolution, but resorting to the kind of violent revolutionary practice that characterized Torres’s life and death is not typical. More common are the grassroots communities and the organization of a pastoral practice that includes consciousness-raising and the facilitating role of engagement with the Bible in light of the experience of injustice. The emphasis on praxis may have a Marxist ring to it, but it has deep roots within the Christian tradition going back to the Jesus movement itself.

Gutiérrez’s work has moved over the years from being more explicitly theological, rooted in the rhetoric of the Second Vatican Council in *A Theology of Liberation*, to his more recent work, which has focused on the antecedents of liberation theology in the “option for the poor” taken by Gutiérrez’s Dominican predecessor Bartolomé de Las Casas, who took up the cause of the indigenous people at the beginning of the conquest. As Las Casas prepared a homily on Ecclesiasticus 34:21–27, the words “Like one who kills before his father’s eyes is a person who offers a sacrifice from the property of the poor” crystallized a sense of the injustice of the economic system of which he was a part that exploited indigenous peoples. The rest of his life was devoted to obtaining rights for indigenous peoples from the Spanish crown. Gutiérrez and many other liberation theologians find the

inspiration for their writing in their work with the poor. They function very much as Gramscian organic intellectuals, in their relating to poor groups offering pastoral and theological advice. The practical faith of the nonprofessional reader can be resourced by a mode of reading of the scriptures, which does not need (even if it was often supported by) sympathetic intellectuals (West 1999).

The Bible has become a catalyst for the exploration of pressing contemporary issues relevant to the community and offers a language so that the voice of the voiceless may be heard. The Book of Exodus, and the story of Hebrew slaves in Egypt being liberated from their oppression and discovering new patterns of life, has been crucial for liberation theology from its inception. The use of the Exodus narrative is selective and does not include the climax of the story—the conquest of Canaan and the annihilation of indigenous peoples that is such a central part of the biblical story. Rather, it offers a constellation of symbols and themes, which are a stimulus for contemporary thought and action, which typifies liberation theology's approach to the Bible. The Exodus story concerns a recognition of oppression, the nature of the society, and its injustice and the enslavement not only economically but also intellectually and ideologically by the Egyptian monarchy. In this way, the biblical tradition becomes a catalyst for new thought and action related to the circumstances of everyday commitments. In the CEBs (*comunidades eclesiais de base*), there is an immediacy in the way in which the text is used because resonances are found with the experiences set out in the stories of biblical characters that seem remote from the world of most people in the more affluent Europe and North America. The Bible offers a means by which the present difficulties can be shown to be surmountable in the life of faith and community commitment. To enable the poor to read the Bible has involved programs of education of the contents of the biblical material, so that it can be a resource for thousands who are illiterate. In such programs, full recognition is taken of the value of the experience of life. It was inspired by the work of the distinguished educator Paulo Freire (1921–1997; Freire 1985). In his pedagogical writings, Freire emphasized the link between knowing and doing, experience and learning. Freire promoted a pedagogical process whereby human beings engage in active yet critical forms of education through which they embrace both their world, and each other, so that

education becomes the site of transformation in which the traditional pupil–teacher relationship is examined and the learning process is transformed into a student-centered education.

That said, the experience of poverty and oppression (often termed “life” or “reality”) is as important a text as the text of scripture itself. It represents another text to be studied alongside that contained between the covers of the Bible. The CEBs have been the dynamo for the emergence of liberation theology’s approach to the Bible. Among these grassroots groups, the Bible has become a tool for the exploration of pressing contemporary issues relevant to the community. Enabling the poor to read the Bible has involved a program of education of the contents of the biblical material. In such popular education programs, full recognition is taken of the value of the experience of life and so includes the wisdom of the artisan as well as of the scholar in interpreting the biblical text.

Theology as it has developed over the centuries can seem abstract from ordinary life as is evident in the way in which “theological” has come to be used to describe abstract, irrelevant discussion of a topic. In contrast, liberation theology has its origins in the reality of the premature and unjust death of many people, as Gustavo Gutiérrez has put it. However sophisticated the books and articles from the liberation theologians may seem to be, it is their experience and that of those with whom they work that is the motor that drives their theology. The struggle for survival and the church’s social teaching prompted priests and religious to think again about their vocation. In so doing, they have learned afresh from the poor as they have lived and worked with them.

The priority given to human experience echoes aspects of theology, particularly since the Enlightenment. This has been, in part, an exercise in opening a space for the experience of the interpreter. An important component of the critical enterprise was the assertion that contemporary experience must claim a place in the interpretative process. The difference is that it is being worked in shanty towns, land struggles, oppressed and humiliated groups, and areas of urban deprivation in the Northern hemisphere, where the rebuilding of shattered lives takes place. The theological agenda of European theology has been more concerned with

thinking about and explaining the truth of faith, whereas for liberation theologians, faith runs parallel to real life and is in dialectical relationship with it. Thereby the meaning of faith and doctrine is illuminated at the same time as the world's wretched condition is confronted and alleviated.

Commitment to the poor becomes the context of reflection, and so practical discipleship becomes the dynamic within which theological understanding takes place. Understanding of God and the world is a gift of grace and a perspective altered in a life of service to those who are the least of Christ's brothers and sisters. As stated in Matthew 25:27–40, which is a key text for all involved in liberation theology:

“Lord, when was it that we saw you hungry and gave you food, or thirsty and gave you something to drink? And when was it that we saw you a stranger and welcomed you, or naked and gave you clothing? And when was it that we saw you sick or in prison and visited you?” And the king will answer them, “Truly I tell you, just as you did it to one of the least of these who are members of my family, you did it to me” (New Revised Standard Version).

Liberation theology contrasts with much of the theology, even left-leaning political theology, that has emerged in the last two centuries, centered in university or seminary, in Europe and North America. There, normally, the priority is placed on intellectual discourse detached from “life.” The key thing is that one first of all does liberation theology rather than learns about it. Or, to put it another way, one can only learn about it by embarking on it. To ask the question, “[W]hat is liberation theology?” and think that one can answer without commitment and the understanding that emerges from doing it is to miss out on the central ingredient of liberation theology. This experience cannot adequately be communicated except by committing oneself and taking the first step along the road of solidarity and action. Therein lies the root of understanding.

512

Libertarianism

Libertarianism is a philosophy that places individual liberty at the center of political thought. Although libertarians acknowledge the value of other goals, such as justice, peace, order, equality, and prosperity, they see them as given meaning by liberty. Libertarians take seriously the admonition of the English classical liberal historian Lord Acton that “[l]iberty is not a means to a higher political end. It is itself the highest political end.” Libertarians support free markets, free trade, repeal of victimless crime laws, and strict limits on governmental powers.

The term “libertarian” was popularized in the United States in the mid-twentieth century after “liberal” had come to be associated with what in Europe is known as “social democracy,” and a new term for liberal ideas was needed. The Austrian economist and later Harvard professor Joseph Schumpeter noted, “As a supreme, if unintended, compliment, the enemies of the system of private enterprise have thought it wise to appropriate its label” (Schumpeter 1954, 394). Thus, libertarianism is sometimes used in the United States to refer to the tradition of “classical liberalism” when “liberalism” would be used in other countries. “Libertarianism” is also sometimes used to distinguish the more radical or consistent proponents of liberal thought from other liberals who might accord more power to the state to intervene in otherwise voluntary relations.

A central tenet of libertarianism is the presumption of liberty, that is, the principle that interference with the freedom of others requires political

justification, whereas their free choices do not. In the absence of a legitimate reason to interfere with speech (e.g., a speech is found to be an incitement to violence), speech should not be censored or restricted. The restriction requires legal justification, but the act of speaking does not. Rights and freedoms are “unenumerated” (that is, not explicitly listed), whereas powers are “enumerated.” That principle was written into the U.S. Bill of Rights, through the Ninth and Tenth Amendments, but it has been largely neglected in jurisprudence. Modern “bills of rights” influenced by social democratic thinking take the opposite view, and enumerate rights against a background of broad and unenumerated state powers.

Libertarians insist that they are neither “left” nor “right” but consistent supporters of liberty and limited government. Issues on which libertarians have been outspoken in the United States and abroad, and where they have distinguished themselves from contemporary American liberals, conservatives, socialists, social democrats, and other political philosophies, include support for unrestricted freedom of trade; support for complete freedom of religion, speech, and expression; opposition to all victimless crime laws, including laws against narcotics and prostitution; protection of property against confiscation; opposition to compulsory “national service,” whether for military or nonmilitary purposes; support for strict constitutional limits on government power; strong skepticism about foreign military intervention; and support for reducing taxes and the burden of government, or even when possible eliminating taxes. There is a “Libertarian Party” in the United States, but libertarians can also be found in the Republican and Democratic parties, as well as among nonpartisan organizations.

Libertarians are not philosophically monolithic, but they encompass many different traditions of ethical and religious thought, all united in the conclusion that “live and let live” is a proper motto for social interaction. Libertarians associate individual liberty with constitutionally limited government, on the grounds that rule-based systems that restrict government authority protect individuals from arbitrary power. John Locke, a canonical figure among libertarian thinkers, stated that liberty, properly understood, did not mean just doing whatever one wants (for everyone would be subject to the arbitrary acts of others), but a “*Liberty* to dispose,

and order, as he lists, his Persons, Actions, Possessions, and his whole Property, within the Allowance of those Laws under which he is; and therein not to be subject to the arbitrary Will of another, but freely follow his own” (1689, Book II, Chapter VI, Second Treatise on Government).

Libertarians see rights, spontaneous social order, and rules of just conduct as mutually reinforcing elements of free societies. According to libertarian social and political thought, when equal rights are well defined and legally secured by institutions of limited government, free people create prospering social orders that are more complex and more orderly than rulers exercising coercive powers could have envisioned or created.

Liberty, Theories of

Much as liberalism, the ideology with which theories of liberty are most obviously associated, has been characterized as a diverse and pluralistic construct, the same can be said of the concept of liberty itself. The term *liberty* and its derivatives have a long lineage; consequently, anachronistic readings of key texts and events are not uncommon. One such instance is the use of *liberty* in the Magna Carta of 1215, resulting in the Charter being popularly depicted as the symbolic (or, more occasionally, as the properly tangible) birth of liberty. Yet the document has gained this status only in the modern era, as liberalism has become a major political force and constitutional arrangements have evolved that appear to owe something to the “tradition” of Magna Carta.

Although liberty and liberalism are obviously entwined, the former being a foundational element of the latter, they should not be seen as equivalent. As an ideology, liberalism is a considerably broader concept that draws as much on the principle of equality as it does on liberty. Theories of liberty are concerned specifically with the idea of agency and the constraints upon this (especially the notion of “structure”). For most intents and purposes, the term *freedom* may be seen as tantamount to *liberty*, although the former is also commonly used to signify particular rights as opposed to the overarching meaning of liberty. In addition to the readily apparent political ramifications that theories of liberty have, the issue extends into other fields too. This is especially apparent when the issue is formatted in terms of the

“structure versus agency” debate witnessed in sociological and historical study, among others.

Main Theories of Liberty

Three main theories of liberty dominate academic discourse. The first two, negative liberty and positive liberty, have become primarily associated with the work of Isaiah Berlin and are the most recognized and debated. The third theory is the republican one, sometimes rendered as civic republicanism or neorepublicanism. This has proven to be a contentious and potentially confusing area, especially given the possible overlap with civic humanism (a term often used synonymously, but avoided here).

Negative Liberty

Berlin’s *Two Concepts of Liberty* (1958, republished in 1969 in *Four Essays on Liberty*) has become the standard work on the distinction between negative and positive liberty. Simply put, the negative sense of liberty may be defined as an individual’s freedom to act without coercion or interference from any other party. This elementary definition does not, however, capture the full range of permutations and competing interpretations of the limits of freedom from coercion. For example, an individual may be unable to purchase food or fulfill another certain wish as a result of poverty, but this supposes a restriction on liberty only if one accepts certain socioeconomic theories that view poverty as the result of oppression by other actors. Oppression thus becomes the part that one believes to be played by other people in frustrating one’s wishes, and this frustration may be indirect or, indeed, unintended (although it may also be direct and intentional). For clarity, incapacity to attain any given goal does not presuppose any restraint on freedom; restraint of freedom arises only where there is constraint effected by other human beings.

Berlin bases his discussion of the negative sense of liberty in part on the ideas of Thomas Hobbes, the seventeenth-century English philosopher. Hobbes believed that liberty was freedom from coercion, but also that the area for this liberty could not be unlimited or “natural,” to use Hobbes’s

own terminology. Unlimited individual liberty would be essentially counter-productive, as it would lead to a chaotic state in which each person might interfere with others' freedom without constraint. Hobbes's own preferred solution to this issue was the establishment of a monarchical government to which all in society would surrender their sovereignty in exchange for social stability. Although such a monarchy would have almost unlimited power, Hobbes believed that by ensuring stability, the conditions would be laid for a preserved area of individual freedom unhindered by the interference of others.

Later thinkers in the liberal tradition have not generally embraced this Hobbesian proposal as they see the risk of arbitrary power as being too great; most have also tended to possess a more optimistic view of human nature than did Hobbes. Most liberal thinkers, such as John Locke, have instead posited an arrangement whereby individual liberty is ensured by a system of legal restrictions on the ability of one person to interfere in the affairs of another. This is often reinforced by a system of the separation of powers in the state so as to prevent "tyranny of the majority" feared by Alexis de Tocqueville. Of course, legal limitations in this regard will constrain liberty in some respects in order to ensure it in others—a recognition, to paraphrase an often-used analogy, that an individual's right to swing his or her fist ends where another person's face begins. The boundary of what should be regulated in order to provide a remaining area of uninhibited liberty is commonly taken to be the distinction between the public and private spheres, yet this is not a fixed boundary. As Berlin points out, this frontier is debated and difficult to pin down as all people are interdependent, and the choices of one person may well impact the life of another. Different conceptions of what area should be reserved to personal freedom have been based on ideas of natural rights and natural law, social contract, and the principle of utility. What is almost always agreed upon is that to have no reserved area of individual liberty at all would be a denaturing force and harmful to humanity. The central issue is finding the optimum balance since it is necessary to sacrifice some liberty to ensure that the remainder is retained, with complete sacrifice being obviously self-defeating.

Much of this presumes that liberty is the ultimate goal of humanity and that freedom is self-evidently desirable. Clearly, political freedom is not always the central desire of each individual; those starving or living in squalor would most probably seek the amelioration of their condition before considering what constrains their liberty. As Berlin notes, those in possession of liberty can sacrifice part or all of their freedom as a moral imperative in order to improve justice or equality, for example, but this does not equate to an increase in freedom for those suffering, as liberty, equality, and justice are distinct values. The compromise and balance between these principles are the distinguishing characteristics of differing versions of liberalism, rather than different theories of liberty.

Positive Liberty

Relative to negative liberty, the positive notion of freedom can be more difficult to define in a straightforward manner. The issue is further complicated by virtue of the fact that the two different senses of liberty do not in practice exist in isolation from one another. Rather, there is interaction between the two, and they can even be conflated. The simplest distinction between negative and positive liberty is often drawn as “freedom from” some given restriction versus “freedom to” act as one desires, but this is really too narrow a definition. Berlin (in *Two Concepts of Liberty*) phrases the divide between the two in terms of “the freedom which consists in being one’s own master [positive], and the freedom which consists in not being prevented from choosing as I do by other men [negative].” There is not merely a semantic difference between the two conceptions but rather a profound difference in intellectual outlook that deserves exploration.

Berlin points out that the thought of John Stuart Mill, one of the most noted British philosophers of the nineteenth century, invokes the conflation of the two senses of liberty. On the one hand, Mill clearly agreed with the idea that coercion was a negative force and that freedom from it was to be viewed as a positive. He further argued that individuals should be free to develop a certain kind of rational and inquisitive character that he saw as inherent to freedom and that, in turn, could be ensured only under conditions of liberty. Yet, as Berlin notes, it has been demonstrated that human genius can and has flourished under restrictive and intolerant

regimes and does not therefore seem to be so intimately tied to the possession of negative liberty. Therefore, Mill's assertion about the value of personal development and a self-conscious state of mind should instead be classed as a manifestation of positive liberty. Here we can begin to get at the root of what the positive notion of freedom really means. It is concerned with internal factors (that is, internal to the individual) that affect the way in which individuals or groups act. More specifically, it is the possession of self-constructed conscious purposes, the recognition that the individual is a subject and not an object, and that we are all rational, thinking beings that are capable of conceiving and working towards goals; in other words, "I am my own master."

The potential for confusing the two senses of liberty is, one can comfortably posit, at least partially explicable by the complexity of the positive sense alone. To this, though, must be added the fact that the latter sense also incorporates a duality in the definition of the self. There is the empirical self, defining itself by the sensory perception of the world around, and the inner—or "real"—self more concerned with the cultivation of higher pleasures. Scope is therefore provided for the two different concepts of liberty to relate to the two different selves, so to speak. The two can also be considered simultaneously, indicative of the pluralism of human values, and a tradeoff between could be contemplated.

To further complicate matters, the notion of the inner self is very often extended beyond the individual and applied to the concept of society as a whole. In such a way, society may be depicted as an organism, something more than the simple sum of its constituent individuals, and therefore capable of having its own desires and, indeed, needs. Conceiving of society as an organic whole has a number of consequences, not least of which is the idea that a "general will" can exist alongside a corresponding notion of "common good." This construct features prominently in the thought of Jean-Jacques Rousseau and was also picked up by the so-called "new liberal" theorists of the late nineteenth and early twentieth centuries. The general will is distinct from a simple majoritarian or factional interest in that it is derived from reasoned and rational principles and is both generally applicable and necessarily guided by the enlightened principle of what is

best for all individuals. As such, laws derived from the general will could trespass on an individual's liberty in the negative sense.

It is at this point that Berlin and others, such as Karl Popper, become concerned by what they see as the calamitous potential of such ideas of positive liberty. If, it is argued, a general will is accepted, then individuals may be coerced into compliance with a goal and be “forced to be free,” as Rousseau put it. The goal itself may be rational and laudable, but if it is predicated on the argument that those who resist compliance have, in fact, already subconsciously recognized and accepted its benefit to themselves—and thus there is consequently no real coercion—the potential for manipulation, abuse, and the rise of totalitarian systems becomes considerable. Other thinkers, notably Charles Taylor and Michael Walzer, have defended aspects of positive liberty on communitarian grounds by arguing that other liberal theorists have failed to understand the importance of social institutions in the construction of the self and are therefore too prone to thinking in terms of atomistic individualism.

Overall, Berlin sees many of the problems of positive liberty as rooted in the idea that there are two distinct selves, compounded by the fact that one of these (the inner self) is transcended into a notion of organic society. If one presupposes an empirical self that must be controlled by the rational “real” self, then the door is opened to the masking of oppression by what Berlin calls the “retreat to the citadel,” where one limits or removes personal desires as a corollary of not being able to achieve them in any case (stemming from the restrictions on one's negative freedom). The promotion of negative liberty provides the best defense against totalitarian regimes and the abuse of power while also providing favorable circumstances for people to act as sovereign individuals (subject to certain limits) and ensuring value pluralism.

Republican Theory of Liberty

The so-called republican theory of liberty is a much-debated concept, but its impact on broader scholarship has been perceptible, especially in the realm of the history of ideas where Quentin Skinner is a leading practitioner. Indeed, it is from this field that the theory has developed, drawing as it does

upon the intellectual lineage of a diverse group of predominantly premodern theorists who themselves adopted and adapted ideas from ancient Rome and Greece in their own arguments on politics and virtue. Contemporary scholars, notably Philip Pettit, have taken up Skinner's discussion and considered its ramifications for present political discourse, especially in relation to arguments about liberty. Most specifically, proponents of republicanism have focused on engaging with the negative sense of liberty that has been dominant in the English-speaking world.

Republicans differ from the traditional theory of negative liberty in that they are concerned with the structures of political power themselves rather than the more specific outcomes of power structures. By way of example, an individual may be relatively free, in the negative sense, living under an authoritarian regime if the regime happens to interfere to only a marginal degree in his or her own sphere of activity (the regime may, of course, at any given time begin interfering more in that person's life, or it may interfere much more in some other individual's life). By contrast, a liberal democracy may be much more active in regulating its citizens' day-to-day activities, albeit within the bounds of the constitution established. Under a standard interpretation of negative liberty, we would conclude that the person living under the authoritarian regime, but experiencing very little interference, was freer than those citizens of the liberal democracy, despite the threat of arbitrary interference at any time in the former case. Republicans see this conclusion as counterintuitive and inadequate because it does not pay sufficient attention to the contingent fact that the authoritarian regime has simply chosen not to act in a more coercive manner, while the liberal democracy is constitutionally constrained in its ability to act arbitrarily. Adherents to the republican view consequently replace the concept of non-interference with that of non-domination.

Exactly what is meant by non-domination is, at times, a bit ambiguous, and any desirable definition would require some integration of the noninterference principle, creating overlap with policies aiming to ensure negative liberty. For example, laws in a republican framework that limit sectional domination or decrease dependence would be seen as increasing freedom in a similar, but admittedly distinct, way to the liberal necessity of surrendering some freedom in order to secure the remainder (we should also

recall Berlin's caution about conflating liberty with other values such as justice). In practical terms, non-domination most clearly means the freedom from arbitrary power, which is to be provided for by constitutional safeguards such as the separation of powers, much as we see in typical liberal arguments. Republicans see this as in need of reinforcement through more active democratic processes than are generally provided under standard liberal arrangements, including enhanced public debate of state and legislative decision making and the provision of a robust means by which citizens can challenge decisions made and hold representatives to account. Such a system would also rely on a strong sense of civic virtue whereby citizens are committed to the maintenance and operation of the system.

The republican theory of liberty is often disparaged as simply an effort to construct a framework for securing negative liberty rather than a genuinely distinct ideal. Such a dismissal appears slightly rash, however, and the shift of emphasis from noninterference to non-domination is no mere sleight of hand. In examining the structures of power in society, the republican thinkers preempted (and perhaps prompted) a renewed emphasis on institutional arrangements in mainstream liberalism. Much remains to be developed in republican theory, though, especially on the matter of what exactly constitutes non-domination and how freedom from interference can be incorporated into it or into republican liberty more broadly.

Key Theorists and Currents of Liberty: A Brief Chronology

A fairly large pantheon of thinkers who have directly engaged with the idea of liberty in an important and meaningful way can be delineated. It is not possible to list all such persons and to give them adequate treatment, so a selection of the most prominent figures is briefly explored below.

John Locke and Early Liberalism

Locke is often seen as the grandfather of the liberal tradition and, although in many ways Hobbesian thought has had more direct impact on

contemporary political theory, his popular image has been held in high esteem. Locke maintained that all men are born free and equal and enter into a social contract with the sovereign of the state in return for the benefits that this brings. Since this contract is one of consent, people have the power to hold their government to account if it fails to promote public good. The Lockean social contract model has proven durable and was picked up, with a Kantian twist, by John Rawls.

Two of Locke's contributions to the theory of liberty stand out as especially notable and worthy of mention. The first is his idea that people have natural rights—such as the rights to liberty, life, and property—granted to them by natural law that are, by consequence, inalienable and are therefore not subject to legitimate political interference. The second key contribution relates to Locke's theory of toleration, framed in reference to religion in his own work, which holds that those whose views are tolerant of others should themselves be tolerated (excepting, in Locke's own opinion, atheists and Roman Catholics). David Hume followed Locke's empirical approach but refined some of his predecessor's principles, such as property rights, away from a natural law basis and towards a pragmatic justification. Similarly, Adam Smith contributed greatly to the development of the liberal approach to political economy through his connection of the theory of liberty to commercial relations.

Jean-Jacques Rousseau and the Socialist Challenge to Liberty

It is sometimes debated as to whether Rousseau really belongs in the liberal tradition at all, but it is clear that his thought has had an impact upon it, particularly in the wake of the French Revolution. His ideas are especially relevant to conceptions of positive liberty and his scheme is most developed in his seminal work *The Social Contract* (1762). Here Rousseau outlined his vision of a society governed according to the principles of the general will, which would ensure the common good was achieved for all its members. Individuals enter into the social contract by surrendering part of their liberty but, in so doing, they also receive a reciprocal return from the peers and thus retain their freedom.

The most important aspects of Rousseau's ideal that have been influential in later intellectual developments within liberalism, be they supportive or critical, have been the value he placed upon individuals as being self-governing participants in society, and the central supposition of the general will concept that there is a common good that transcends individual desires. The latter point is especially contentious as it presents a fundamental challenge to the value of negative liberty. This early development of the positive sense of liberty was picked up by socialists, such as Charles Fourier, seeking to deconstruct the ideology of liberalism whilst simultaneously laying claim themselves to be the inheritors of the tradition, albeit with a better claim to fulfilling its promises. Many socialist theorists, including Karl Marx, appear to reject the distinction between negative and positive liberty on the grounds that it ignores the true complexity of social relations.

John Stuart Mill

Mill is perhaps the most famed of liberal theorists and must take considerable credit for the renewal of liberalism in the mid-nineteenth century; his work *On Liberty* (1859) is one of the central texts in the canon of liberalism. Mill was especially concerned with the principle of individuality and the way in which ensuring liberty provides for the proper development of the individual. Mill worked in the British empiricist tradition and derived many aspects of his approach from David Hume and John Locke while marrying this to the utilitarianism of Jeremy Bentham. The bringing together of liberalism and utilitarianism in Mill's work was not always successful, and he appears to prioritize individual rights over the principle of utility (that which constitutes the greatest good for the greatest number) in many cases, although he always predicates his arguments on utilitarian grounds rather than those of natural rights as Locke did.

Mill was particularly important in the development of the "harm principle," his version of which holds that society can legitimately restrict the actions of an individual only if these actions harm another. This idea has become a cornerstone of liberal thought, although Mill's own definition of what exactly constitutes harm is open to some debate, and he acknowledges a distinction between the public and private sphere in this respect. His

defense of free speech is also notable, and his ideas about the best structure for democratic society (as expounded in *Considerations on Representative Government*, 1861) have proven resonant, although they have never been adopted in full.

Thomas Hill Green and the “New Liberalism”

Green, influenced by Hegelian approaches to philosophy, was part of the British idealist movement that stimulated the development of ‘new liberalism.’ He was a chief proponent of the view that there was a dialogic between society and individuals and that the former was a formative and important influence upon the latter, while he also recognized that individuals possessed both rights and obligations in relation to their place in society. In advocating a role for the state in the creation and maintenance of conditions suitable for human intellectual flourishing, Green made an important contribution to the positive notion of liberty.

Leonard T. Hobhouse took up Green’s philosophy and replaced the Hegelian basis with a sociological impulse also advocating positive liberty and the need to provide for individual development, or individuation, rather than a purely negative notion of individualism. John A. Hobson also played a key part in this refinement of new liberalism, positing an organic interpretation of society with a general will that underpinned calls for a much-expanded and more interventionist state to redress the social problem of the late-nineteenth and early-twentieth centuries.

Libertarianism

The boundaries between what should be thought of as libertarianism and as liberalism (especially in the classical sense) are somewhat vague, but with respect to the application of theories of liberty, the distinction can be important. Liberalism is typified by a balance between different values—including liberty, but also equality, justice, fraternity, and so on—while libertarianism has emphasized negative liberty above others (and often to the complete exclusion of other values, which are deemed to be relativistic). Friedrich Hayek and Robert Nozick have perhaps been the best-known

proponents of a libertarian attitude toward politics, although their approaches differ considerably. Indeed, there is no single current of libertarianism, and a common divide is often made between “left” and “right” versions of the doctrine and between variants described as minarchist, or favoring a very limited state, and anarchist, consisting of those that condone the abolition of the state. In popular political discourse, the minarchist tendency has proven most resonant, arguing as it does that the state is required to ensure the protection of individual liberty and the principle of self-ownership. This may be contrasted with the classical liberal “night-watchman” state, which, although superficially similar, could well be tasked with other responsibilities in addition to the preservation of liberty. Libertarians always view the state, however small it may be, with at least some degree of suspicion since they view it as having the potential to interfere in individuals’ freedom to act as they choose and as being a method of coercion through its possession of the threat of force. Libertarian conceptions of liberty have gained increasing traction from the middle of the twentieth century to the present day and have probably been most apparent in the economic sphere and the renewed commitment to free markets. More broadly, libertarianism is indicative of a shift away from new liberal notions back towards the more classical theory of liberty.

519

Lincoln, Abraham

Abraham Lincoln was the sixteenth president of the United States (1861–65) and is widely considered the quintessential American because of his rise from humble roots and his devotion to human equality. “As I would not be a slave,” Lincoln wrote, “so I would not be a master. This expresses my idea of democracy.” His statesmanship was guided by the principles of equal rights and government by consent of the governed found in the Declaration of Independence. He also emphasized the opportunities for self-improvement and advancement created by the principle of equal protection of the laws. “Liberty to all,” Lincoln said, “clears the path for all—gives hope to all—and, by consequence, enterprise, and industry to all” (remarks at Bloomington, IL, November 21, 1860, as quoted in Basler 1953, Vol. 4, 143–44).

He thought these principles should guide the practical administration of the U.S. Constitution. However, slavery was lawful in most of the states at the nation’s founding and was accommodated by the constitutional compromises of 1787. Lincoln believed that despite these initial concessions to slavery, the American founders intended the eventual abolition of slavery. But with the establishment of “king cotton” in the Southern plantation economy, white Southerners began defending slavery, in the words of South Carolina Senator John Calhoun, as a “positive good” for both master and slave. Thus, the United States became divided over the future of slavery in the American republic.

Early in Lincoln's political career as a Whig politician, his speeches focused on political economy. He endorsed Kentucky Senator Henry Clay's "American System," which favored federal and state funding of infrastructure or "internal improvements" to promote every citizen's "right to rise." But in 1854, Illinois Senator Stephen Douglas tried to reduce slavery agitation through a policy of "popular sovereignty." His Kansas-Nebraska Act authorized local settlers—not Congress—to decide the legality of slavery in that territory. In an 1854 speech at Peoria, Illinois, Lincoln appealed to "the Spirit of '76" in an effort to put slavery "back in the course of ultimate extinction." In doing so, he explained, "we shall not only have saved the Union; but we shall have so saved it, as to make, and to keep it, forever worthy of the saving."

His efforts to establish the Republican Party and his debates with Stephen Douglas sought to restrict the spread of slavery. Although he lost his 1858 campaign for the Senate, the national reputation he achieved, coupled with a divided Democratic Party in 1860, propelled him to the presidency in 1860.

His election provoked a backlash by most Southern whites, who asserted a right to secede from the American union and form a separate confederacy. They feared that Lincoln would try to abolish slavery in violation of what they considered their rights as states, and they precipitated a civil war by firing on the federal Fort Sumter, South Carolina. Their refusal to abide by the election constituted a rebellion; as Lincoln stated in his First Inaugural Address, secession was "the essence of anarchy" in its defiance of the Constitution and the rule of law.

In his Gettysburg Address, Lincoln interpreted the rebellion as a test of whether any nation "conceived in liberty and dedicated to the proposition that all men are created equal" could long endure. Earlier that year, he freed most of the 3–4 million American slaves to deprive secessionists of the labor of their "peculiar institution." Lincoln justified his Emancipation Proclamation as a military necessity in accordance with his constitutional role as commander-in-chief. He declared to Congress, "In giving freedom to the slave, we assure freedom to the free—honorable alike in what we give, and what we preserve. We shall nobly save, or meanly lose, the last best

hope of earth” (Second State of the Union Address, 1862). Given the momentous import of Lincoln’s proclamation, it surprisingly lacked the eloquence of the Gettysburg Address. But it was intended to have the force of law, and Lincoln wanted Americans to see his proclamation as consistent with the Constitution and the very rule of law rejected by the rebellious South.

The famous last sentence of the Gettysburg Address joined Lincoln to Thomas Jefferson in his embrace of the robust democratic ideal that had been viewed skeptically by many of the Founders in 1787. Unlike James Madison in Federalist #10, Lincoln at Gettysburg endorsed “government of the people, by the people, for the people” and urged that it not be allowed to perish from the earth.

At his second inauguration, with the war almost over, Lincoln sought to heal the wounds of a divided nation by providing a united way of thinking about slavery and the Civil War. He proposed that slavery was an offense that came due to both Southern and Northern citizens, which God “now wills to remove” through “this mighty scourge of war.” But this position meant that Southerners needed to change their minds about slavery and the meaning of the Union. Lincoln hoped the nation would now become in practice what it had long declared in principle: a nation devoted to protecting the equal rights of all her citizens. The failure of Reconstruction would postpone Lincoln’s hopes for almost a century.

Locke, John

The belief that governments should be democratic, tolerant, and uphold human rights is now almost universally acknowledged. Among the most influential writers to have promoted this agenda in opposition to patriarchal, aristocratic, and narrowly religious principles was the liberal philosopher John Locke (1632–1704).

Locke's three most significant works were published in the space of two years. The *Letter Concerning Toleration* appeared in 1689. This was followed in 1690 with the *Essay Concerning Human Understanding*. Also published in 1690 was *Two Treatises of Government*, including Locke's most celebrated political work, the Second Treatise "Concerning the True Original, Extent, and End of Civil Government."

Locke was born in the village of Wrington, in the county of Somerset in England. He attended Westminster School and went on to become a don at Christchurch College, Oxford. In 1666, Locke met Anthony Ashley Cooper, later the first Earl of Shaftesbury. He became Shaftesbury's secretary and shared in his political ventures, although he still formally retained his position at Christchurch. The reigning monarch, Charles II, had no legitimate children and there was a question over who should succeed him. Locke and Shaftesbury were among those opposed to Charles's brother James acceding to the throne because he was a Catholic. Quite how far they were prepared to go to prevent him from becoming king is unclear, although it was alleged that there was a plot to assassinate both Charles and James.

Early in 1683, Locke thought it prudent to quit England for Holland. Shortly thereafter, several of his political allies were charged with treason and executed. The government ordered that Locke be dismissed from his position at Christchurch and attempted, unsuccessfully, to have him extradited. James went on to become King James II in 1685, but he was ousted by the Protestant William of Orange in the Glorious Revolution of 1688. In 1689, Locke returned to England in high favor and published his famous works, although he cautiously withheld his name from both the *Letter* and *Two Treatises*. He obtained a position on the Board of Trade and contributed to the government's financial policy. Locke never married. He died at Oates, a country house in Essex, and was buried at the church in nearby High Laver.

Toleration

Locke's *Letter Concerning Toleration* advocates religious tolerance, although the argument it contains can readily be extended to toleration more generally. Locke contends that the purpose of the state is to enable its members to pursue life, freedom, health, leisure, and wealth. In fulfilling this function, the state can legitimately punish people but only if they violate the rights of others to enjoy these advantages; it should not punish those who are harmlessly engaged in a voluntary activity. A religious group is a form of voluntary organization joined by people who believe that its doctrine will lead them to salvation. Their activities do not violate the rights of any other member of the state. One's doctrinal views on, for example, transubstantiation, are of no matter to anyone else. The state should, therefore, tolerate religion.

The argument thus far is an elaboration of the idea found in Thomas More's *Utopia* that we have the right to do anything that is not injurious to other people. But Locke has to go further than this to counter the claim that intolerance is justified to promote true religion. Locke agrees that there is "but one truth, one way to heaven" but argues that this does not justify repression because one cannot know that the religion that happens to be favored by the state, while others are suppressed, will guide people along the one true path. The logic of this view is evident, argues Locke, when one considers that many different religions have found favor with those in

power in different states over time: These religions contradict each other, and so they cannot all be right and in fact they must nearly all be wrong. Later liberal theorists, including John Stuart Mill and Karl Popper, extended this line of argument, contending that tolerance should be practiced with respect to all opinions, whether religious or not. This is not because all opinions are equally valid but because one can never be finally sure that one's own opinion is in the right. It is by allowing the free interplay of rival ideas to work themselves through and test themselves out that the truth is most likely to emerge.

Locke acknowledges the potential danger posed to the state by religions that aspire to power. To counteract this danger, Locke argues that the adherents of a religion should operate strictly within the bounds of society. Just as the state should not interfere in the actions of a voluntary religious association, so this association should not attempt to arrogate to itself any powers reserved to the state. In particular, if a religion enjoins its members to obey the head of another state, then it oversteps these bounds and should not be tolerated. This argument is usually read as being directed against Catholicism, although the example given by Locke is of a Muslim living in a Christian state but maintaining an allegiance to the authorities in Turkey. Locke also contends that a religious association should not punish its members. Tolerance of religion is premised on the assumption that religious practices do not threaten people's rights and should not, therefore, be punished by the state. It follows that disputes within a religious denomination do not give any legitimate reason for bishops or others with religious authority to punish dissenting members, although they can be expelled.

Rights and Duties

In Locke's view, the state, like a religious organization, can be compared with a voluntary association, albeit one that has the power to punish by death. However, the state is formed not to punish its members but to protect them. To explain this protective theory of the state, Locke loosely follows the contract theory found in Thomas Hobbes's *Leviathan* (1651). Like Hobbes, Locke imagines people living in a state of nature where there is no law. The state of nature is transformed into a governed state or

commonwealth when its inhabitants make a contract with each other to designate a ruling body. This is done to ensure mutual protection against the threat of one another. However, where Hobbes had the state of nature as a calamitous war of all against all, Locke contends that a state of nature and state of war are not synonymous. People in Locke's state of nature certainly have reason to be afraid of each other, but enmity is no invariable rule and at least they do not have to deal with a tyrannical ruler. In this relatively pacific state of nature, there is sufficient trust and cooperation to establish the right to life, health, liberty, and property.

The right to liberty is intrinsic to the state of nature as there are no government constraints on people's actions. The only laws are the laws of nature, which enjoin everyone to treat others equally and respect their rights. The right to property is conferred by working on nature in some way. When a man's horse bites the grass, it becomes his. When his servant digs the turf, and when he mines ore from the ground, then these things too become his property. The extent of a person's property acquired in this way has a natural limit in what can be used before it spoils. However, Locke goes on to explain that money lasts indefinitely, which allows us to accumulate property beyond this limit.

The tendency in liberal thought—indeed all modern Western political thought—has been to move away from any theological basis and Locke generally fits this pattern. For example, one might easily conclude that the implicit message of his *Letter Concerning Toleration* is that *none* of the vying religions are true. However, Locke appears to have been sincere in his religious beliefs and, in one important respect, retains religion in his philosophy. Locke justifies the right to life by redefining it as a duty that we owe to God. Our lives, Locke explains, are the property of God, so we should neither kill ourselves nor anyone else.

According to Locke, the rights that we have from birth are not conditional on fulfilling a duty or acting reciprocally. Locke framed the *Treatises* as a response to Robert Filmer's *Patriarcha* (1680). Filmer had argued that the relationship of a king to his subjects was akin to that of a father and a child. Using examples drawn from *Patriarcha*, Locke interprets this to mean that a father, if he so chooses, has the right to sell or castrate his child. Locke

counters that parents have no such horrific rights over their children but rather duties toward them. Parents can exercise their judgment on behalf of the child but only to promote their physical and mental development and enjoyment. It is children, therefore, who have rights over their parents, who have a duty to care for them. These rights are, initially at least, unconditional: One cannot impose conditions on a baby.

Democracy and Revolution

Hobbes's state is formed by an irrevocable transfer of power to a sovereign ruler. By contrast, the power handed to the government in Locke's version of contract theory is provisional. The commonwealth that is formed out of the state of nature has as its purpose upholding the rights of its citizens and, in particular, their right to life, liberty, and property. The people that have agreed to establish the state retain the right to get rid of it if fails to maintain these rights.

Locke's preferred form of government is an elected legislature that meets periodically to create new laws. It is not a professional body and does no more than is necessary before the legislators return to their occupations in society. The laws are upheld by an impartial judiciary, and a permanent executive undertakes the business of government. If the legislature fails to protect the interests of the people, it can be replaced. If the executive branch of the state usurps power, becoming unaccountable and taking over the functions of the legislature, then it can be legitimately overthrown in a revolution. By exceeding its authority, the executive turns to the use of force. This places it in a state of war against the citizens of the state, and under these circumstances, the citizens have a right to respond with force.

Influence and Criticism

In the seventeenth and eighteenth centuries, Locke's political influence extended beyond liberal philosophers to include revolutionaries. He was directly involved in the opposition to James II, which culminated in the Glorious Revolution and his writings influenced the American revolutionaries, particularly Thomas Jefferson. Locke's ideas are seen in the

1776 Declaration of Independence, with its right to “Life, Liberty and the pursuit of Happiness,” as well as in the separation between church and state, and division of power between executive and legislature in the U.S. Constitution.

Today, a broadly Lockean vision of democracy is either realized or aspired to the world over. Nonetheless, Locke can be criticized from both right and left. On the right, Edmund Burke’s conservative condemnation of those who speculate on abstract universal rights in a way that is divorced from nationality, culture, and tradition might well have been urged with Locke in mind. On the left, Karl Marx saw Locke as a bourgeois ideologue. As Marx wrote in *The Eighteenth Brumaire* (1852), a rising capitalist class in seventeenth-century England clothed its intentions in religion. But “when the real goal had been achieved and the bourgeois transformation of English society had been accomplished, Locke supplanted Habakkuk.” C. B. Macpherson provides a similar analysis, one that focuses on Locke’s defense of property rights and implicit endorsement of wage labor (why does the turf that is dug up in the state of nature not belong to the servant?). These arguments suggest that Locke is, at least, a more complex figure than the saintly champion of freedom that is sometimes portrayed by his admirers. That there is another side to Locke is evident from some of his lesser-known works. The violently punitive recommendations in his *Essay on the Poor Law and Working Schools* (1697) can only be described as inhumane. His insistence on the right to liberty sits somewhat awkwardly with his role in drawing up *The Fundamental Constitutions of Carolina* (1669), which grants slaves the right to choose their religion but to be, in all other respects, slaves. Perhaps such things are mere lapses, but it is also possible that they betoken more general problems both in Locke’s thought and in the modern democratic societies that he has helped to forge.

523

Lukács, György

György Lukács (1885–1971), who started and ended his career as a literary theorist and critic, is best known for his influential contributions to discussions of German idealism and Marxist philosophy. Along with Karl Korsch, Lukács was one of the originators of so-called Western Marxism through his key contributions to political thought: *Theory of the Novel* (1916), *History and Class Consciousness* (1923), *The Young Hegel* (1975), and *The Process of Democratization* (1969).

Lukács was born into a wealthy Jewish family in Budapest and studied at the universities of Budapest and Berlin. He personally knew and was influenced by figures such as Ervin Szabó, Max Weber, Georg Simmel, Stefan George, and Ernst Bloch. For much of his life, Lukács was involved as a political figure and public intellectual as cultural commissar of the short-lived revolutionary Hungarian government of Béla Kun in 1918–19, and the reformist government of Imre Nagy that was crushed by the invasion by the USSR in 1956.

After his first book, titled *Soul and Form* (1911), Lukács published *Theory of the Novel*, a key pathway via what he referred to as “Romantic anti-capitalism,” from the detached, ironic aestheticism of his first book to Marxist-Leninist commitment. Anticipating the revolution brewing in the east, Lukács suggests that a return to the epic unity of individual and world could be glimpsed in the works of Fyodor Dostoyevsky and Leo Tolstoy. Lukács’s conversion to Marxism occurred in the course of the Bolshevik

Revolution, and such a conversion was reflected in *History and Class Consciousness* (1923). The most important aspect of this book from the standpoint of political thought is the 65-page essay “Reification and the Consciousness of the Proletariat.” This essay is a *tour de force* of social theory and philosophy, one that synthesizes Marx’s discussion of commodity fetishism in the first chapter of Vol. I of *Capital* with phenomenology and sociology, to extend and deepen Marx’s argument regarding the fetishization of the commodity in capitalist society. Lukács extended this analysis beyond the narrow ambit of the realm of exchange to an account of how society in its totality becomes “reified” (literally “thingified”). This means that even the most rarefied, autonomous products of bourgeois civilization, for example, art or idealist philosophy, become marked by reification or the “contemplative attitude.” This kind of analysis of cultural forms was far more sophisticated than the crude base/superstructure model that lay at the heart of the Marxism of the Second International, for example. The conception of reification enabled Lukács to engage in a “meta-critique” of philosophy through which he sought to demonstrate that bourgeois philosophy, insofar as it is constituted by insoluble tensions or antinomies that it is unable to solve—for example, the Kantian oppositions between the noumenal/phenomenal, reason/understanding, subject/object—had reached its own immanent limit. The seemingly insoluble oppositions of bourgeois thinking could only truly be overcome in the praxis of the proletariat that, in understanding the world as the product of its practical activity or labor, would attain self-knowledge as the identical subject-object of history.

Lukács’s defense of the Party as the locus of revolutionary consciousness and therefore as substitute for Hegel’s “absolute knowledge” led to charges of Stalinism. Yet, this is not entirely fair, especially if one looks at Lukács’s last work, written in the aftermath of the Prague Spring of 1968 and Alexander Dubček’s attempt to forge a “socialism with a human face,” translated as the *Process of Democratization*. In it, Lukács takes up a position based on Lenin’s new economic policy (NEP) of 1921–28, the termination of which signaled the onset of Stalinization. He also draws on Lenin’s idea of habituation or a new kind of praxis through which a new socialist man would be constituted. In keeping with *History and Class Consciousness*, Lukács repeatedly emphasizes the need for attention to

constituting the subjective preconditions for an authentic socialist democracy. However, Lukács troublingly insisted, though, that these subjective preconditions would have to be introduced into the working class from the outside.

Lukács was criticized by Theodor W. Adorno, an important representative of critical theory, for an all too apologetic “reconciliation with reality”—that is, for far too sanguine an assessment of the capacity of “realist” representations of late capitalist societies to yield genuine knowledge about the historical process and hence the possibilities of transforming it. Perhaps the most influential and important criticism of Lukács, however, was made in the 1960s by Louis Althusser, who used Lukács’s Marxism as a foil for his own structuralist reading of the supposedly scientific, “mature” Marx. More recently, Lukács’s influence has returned in the guise of Michael Hardt and Antonio Negri’s notion of the proletariat that turns, however, not on consciousness but on the production of affect, which gives rise to the unified political subject they call, following Baruch Spinoza, “the multitude.”

Luxemburg, Rosa

Luxemburg, Rosa

523

524

Luxemburg, Rosa

Rosa Luxemburg (1871–1919) was a Marxist theorist, revolutionary leader, and martyr of the international socialist movement. Born in a Poland divided under German and Russian domination, she was involved in revolutionary struggles of each country. From a cultured and well-to-do Jewish family in Warsaw, she attended the University of Zurich in Switzerland, receiving a doctorate in economics. She became active in the revolutionary movement while in her teens, soon rising into the leadership circle of the Social-Democratic Party of the Kingdom of Poland. This group's antinationalist orientation caused it to be outpaced by other currents emphasizing the cause of Polish independence. Luxemburg's working-class internationalism, however, caused her to move into Germany to play a more substantial role in the massive and influential German Social Democratic Party (SPD).

Luxemburg's polemic *Reform or Revolution?* (1899) challenged prominent SPD theoretician Eduard Bernstein, who saw Karl Marx's revolutionary approach as no longer relevant, and argued that a piecemeal reform of capitalism could result in a gradual evolution to socialism. Luxemburg warned that this would push "the labor movement into bourgeois paths" and "paralyze completely the proletarian class struggle," resulting not in the realization of socialism, only in the reform of capitalism. Luxemburg insisted that "capitalism, as a result of its own inner contradictions, moves toward a point when it will be unbalanced, when it will simply become impossible" (ch. 1). Such a crisis would cause its defenders to destroy

whatever social reforms and democracy had been won in previous struggles. Workers would have to use revolutionary action and establish their own political rule to ensure both the political and the economic democracy that she saw as the core of socialism.

Partly on the basis of mass working-class upsurges that swept through eastern and central Europe in 1905, Luxemburg believed capitalism periodically would generate spontaneous insurgencies that should be anticipated, supported, and led by the organized socialist movement. She offered this perspective in *Mass Strike, Political Party, and Trade Unions* (1906), insisting that the more cautious trade union and electoral tactics of the SPD were like the labor of Sisyphus (rolling the boulder up a hill, only to have capitalist dynamics push the gains back down again). Only a revolutionary socialist approach, she insisted, would secure permanent gains for the working class.

Luxemburg's *The Accumulation of Capital* (1913), an economic analysis of imperialism, describes capitalism as an incredibly expansive system with dynamics similar to what would later be termed "globalization." In contrast to the views of Lenin, she saw imperialism as not restricted to "the highest stage" of capitalism. Rather, it is something that one finds at its earliest beginnings—in the period of what Marx called "primitive capitalist accumulation." It would continue nonstop, with increasing velocity and violence. She saw this as intertwined with the rise of militarism—leading to World War I and facing humanity with a choice between "socialism or barbarism," as she put it in *The Crisis in the German Social Democracy*, also known as "The Junius Pamphlet" (1915).

More than a theorist, writer, and educator, Luxemburg was also an organizer and activist, imprisoned more than once—by Russian authorities in the wake of the 1905 revolutionary upsurge, and by German authorities for her uncompromising opposition to World War I. She helped to form the Spartakusbund (the Spartacus League, named after the rebellious leader of Roman slaves), which rallied revolutionary socialists—workers as well as intellectuals—to do what the SPD had ceased to do: oppose war, imperialism, and capitalism.

Despite her criticisms regarding the policies of Lenin and Trotsky (particularly around their restrictions of democracy), she was a supporter of their 1917 Bolshevik Revolution in Russia. Shortly before her death, she helped to found the German Communist Party.

World War I and defeat had caused the German monarchy to collapse, amid an upwelling of revolutionary sentiment among German workers. Luxemburg was especially critical of secret deals made between SPD moderates and the German military to draw this energy into “safe” channels of a new Weimar Republic. In her view, a working-class revolution for socialism was on the agenda.

In January 1919, against Luxemburg’s warnings, some of her comrades, led by Karl Liebknecht, became involved in a premature uprising. In the wake of the revolt’s suppression, paramilitary groups (which consisted largely of future Nazis) organized under the name of the Freikorps systematically rounded up and murdered left-wing “troublemakers.” Luxemburg and Liebknecht were among the victims.

Macaulay, Thomas Babington

Macaulay, Thomas Babington

525

526

Macaulay, Thomas Babington

One of the most eminent historians in early Victorian Britain, Thomas Macaulay (1800–59) was an orthodox, rather than a pioneering, liberal, with little sympathy for the democratic movements of his time. His significance for political theory today is not a result of his generally derivative opinions on normative questions but of his ability to shape a persuasive and entertaining narrative of British national history that foregrounded the virtues of aristocracy and empire.

Macaulay was born in Leicestershire. His father was a wealthy Scottish merchant and member of the evangelical “Clapham Sect,” while his mother’s family comprised successful booksellers from Bristol. The younger Macaulay was a student at two minor private schools in Southern England (1812–18) before he enrolled at Cambridge University (1818–24). In later life, in addition to writing history, he became a literary essayist, a poet, and a Whig cabinet minister (1839–41 and 1846–47). Macaulay served as a Member of Parliament three times (1830–34, 1839–47, and 1852–56) and was made a peer in 1857. In the 1830s, he developed an important association with Britain’s Indian colony, serving as a member (later Secretary) of the Board of Control for India (1832–34) and then as a member of the Supreme Council of India (1834–38), a position that involved traveling to the subcontinent to participate in educational and legal reforms. His literary reputation was initially established by various essays for *The Edinburgh Review* in the 1820s and cemented by *Lays of Ancient Rome* (1842) and *Critical and Historical Essays* (1843). Four volumes of

his masterpiece, *The History of England*, appeared during his lifetime (two in 1848 and two in 1855), the fifth being published posthumously in 1861. At the height of his fame, Macaulay died of heart disease in 1859.

Macaulay's antidemocratic liberalism emphasized the desirability of individual freedom, minimal government, the rule of law, and proportionate punishments for breaches of the law, and many of his views followed the conventional wisdom of his time. His opposition to adult male suffrage in the debates prior to the 1832 Reform Act is well documented, and he was a free trader but not a pacifist. He continued his family's traditional opposition to legal slavery throughout his public career. He argued against procedural discrimination against Jews, Catholics, and nonconformists in the "emancipation" debates of the 1820s, and (on at least one occasion) he deviated from laissez-faire orthodoxy by supporting the Ten Hours Act of 1847.

Macaulay's historical and literary texts were usually highly political, not merely in the sense that they dealt with monarchy, war, and government, but also because they presumed a certain worldview that seemed particularly favorable to the British empire in his own time. This anglicized version of Enlightenment optimism has often been described by scholars as "the Whig interpretation of history"; it was a view that assumed that, other things being equal, material, moral, and scientific progress was constant and ongoing, provided that politicians avoided the kind of extremist policies that confused anarchy with liberty and despotism with civil order. Macaulay was particularly influenced by the Scottish historical novelist Sir Walter Scott, and *The History of England*, which covers the period 1688–1702, was notable for its clarity of language, strong pictorial imagery, and emphasis on characterization and biographical anecdotes (often presented like the scenes of a play), all designed to enlist the reader's imagination and sympathy.

Over the years, Macaulay's "Whig interpretation" has met with many different criticisms. He has been accused, for example, of giving unjustified praise to Whigs and Protestants, of incorrectly assuming that late-seventeenth-century England made a unique contribution to human civilization; of glossing over the less desirable aspects of British

commercialism, militarism, and imperialism; of not properly documenting his sources; and of neglecting sociological and economic factors in history. In his defense, it can be argued that *The History* praised several moderate Tories and Whigs (also known as “trimmers”), that it acknowledged “great national crimes and follies” in America and Ireland, and that Macaulay was in effect writing a piece of literature and was never engaged in the project of “objective” history. Nevertheless, Macaulay’s pleas for the superiority of English bourgeois culture and British parliamentary liberalism seem dated today, and he probably erred in treating the events of the 1680s and 1690s as more significant for nineteenth-century Britain than those of the 1640s.

Madison, James

Madison, James

526

528

Madison, James

James Madison (1751–1836) was a planter, constitutional theorist, legislator, and the fourth president of the United States. Madison's home all his life was in Orange County, Virginia, on a plantation, Montpelier, worked by perhaps 100 slaves. Although he abhorred slavery, he remained a Virginia planter, working within the traditional family-based political system and unwilling to forgo the economic advantages that slavery offered to his family.

Madison received a thorough classical education in Greek and Latin, and he learned Christian precepts from his clergymen teachers at The College of New Jersey at Princeton. Madison also read Francis Bacon, John Locke, Isaac Newton, Jonathan Swift, Richard Steele, David Hume, Montesquieu, Voltaire, and others who fashioned the Enlightenment view, which became his own, although his political thinking always rested as well on Aristotle's understanding of "man as a political animal."

In 1776, Madison was elected to the Virginia convention that drafted a new state constitution. In 1780, he was elected a Virginia delegate to the Continental Congress, where he soon became convinced that a stronger frame of government was needed to replace the Articles of Confederation.

At the Constitutional Convention of 1787, he supported a strengthened executive, a broadly based House of Representatives, long terms in the Senate, and an independent federal judiciary. In his famous Federalist Paper

#10, Madison offered the idea that the multiplicity of special interests (“factions”) in a large republic could be made to counteract and neutralize one another, thus preventing any of them from tyrannizing over the others. Here and elsewhere in *The Federalist*, notably in #51, Madison argued for the system of governmental checks and balances that have come to constitute the U.S. federal system. Despite Madison’s sometimes negative, partially Hobbesian view of human nature, the solution he fashioned was almost the opposite of the all-powerful Hobbesian leviathan.

Madison formulated strategy for supporters of the proposed Constitution, using the Federalist papers to justify it, to explain the novel federal system being proposed, and to defend the envisioned House of Representatives and Senate while warning against the danger of an all-powerful legislature. Then, as a member of the first U.S. House of Representatives, Madison proposed new revenue laws, ensured the president’s responsibility for the conduct of the executive branch, sponsored the Bill of Rights, drafted George Washington’s inaugural address, and helped the president make the precedent-setting appointments of his first term.

Madison, along with Thomas Jefferson, organized politically against *Federalist* co-author and Secretary of the Treasury Alexander Hamilton’s financial plans for a national bank and against his broad interpretation of governmental powers under the Constitution. This move culminated in the development of the new Democratic-Republican Party, creating party strife with the Federalists—a conflict that ran counter to Madison’s idea of good government. He nonetheless persisted in developing a stricter constitutional theory that sought to limit the powers of the national government to those more explicitly granted in the document, although he was not dogmatic on this point.

In 1798, as a member of the Virginia House of Delegates, Madison opposed the Alien and Sedition Acts, which he believed severely threatened free government by undermining the right of free speech and other rights guaranteed in the Bill of Rights. In the Virginia Resolutions and Report of 1798 and 1800, he condemned the Sedition Act’s restrictions on freedom of expression.

As Secretary of State in Jefferson's administration, 1801–09, Madison guided negotiations to purchase Louisiana in 1803 and favored the Embargo of 1807, a further effort to apply his cherished principle that the United States could protect its rights by commercial policy rather than resort to war.

Elected President in 1809, Madison saw his diplomatic efforts fail to stop depredations by European powers, especially Britain. He asked a divided Congress for a declaration of war against England in 1812. Early in the war, well-led British troops generally bested American forces, and in August 1814, a small British force burned the public buildings in Washington. American victories elsewhere in 1814 led to an honorable peace treaty signed with Britain in Ghent, Belgium, on Christmas Eve 1814.

In his last two years as President, Madison proposed a recharter of the National Bank, a moderate protective tariff, federal support for building roads and canals (requiring an amendment to the Constitution), a national university in the District of Columbia, and a strengthened military establishment.

Retired to his Virginia farm, Madison helped Thomas Jefferson found the University of Virginia, attended the Virginia constitutional convention of 1829, and defended the union against the doctrine of nullification. He died on June 28, 1836, the last survivor of the founders of the American republic.

In his understanding of the Constitution, Madison always remained a child of the Enlightenment. He took as his own conscious intellectual framework the natural-law philosophy. He believed in the immutable natural rights of humans, and he held that the Constitution was fundamental law and hence was not changeable at the whim of a mere majority of the people. Higher law was not set by civil society, the Constitution was more than what the Supreme Court said it was, and principles of right and wrong were not determined by the expedient of head-counting. The dogmas of human freedom and liberty of conscience, for example, to which Madison adhered as gospel, were not simple rules of thumb that a particular society might find useful at a given time, and that might be discarded as times changed. Even within this view of higher, or natural law, though, Madison's long

political experience left him with an ambivalent understanding of human nature as a combination of good and bad tendencies. When Madison is compared with more modern thinkers, his thought is closest to that of Protestant theologian Reinhold Niebuhr.

Maine, Henry

Maine, Henry

528

529

Maine, Henry

Henry Sumner Maine (1821–88) was a nineteenth-century legal scholar who argued that, in premodern societies, rights and duties were attached to inherited positions within tribes and families (a hierarchy of *status*), while in modern societies, rights and duties were distributed more efficiently—in terms of both economic productivity and personal liberty—as a result of free agreements (*contracts*) made between individuals. This was a particular example of his more general belief that both human societies and human legal systems evolved in phases that were intimately interconnected.

Born in Bedfordshire, England, Maine was educated at the Christ's Hospital School in Sussex (1829–40) and at Cambridge University (1840–44). In 1845, he became a junior tutor at Trinity Hall, Cambridge, and he was later Regius Professor of Civil Law within the University (1847–54). Subsequently, Maine became a barrister (1850), and from 1852 to 1862, he served in London as a Reader in Roman law and jurisprudence for the Council of Legal Education. Between 1862 and 1869, he lived in India, where he served as Vice-Chancellor of the University of Calcutta and as a legal member of the Governor-General's council. From 1869 to 1877, he held the position of Corpus Professor of Jurisprudence at Oxford University, becoming Sir Henry Maine in 1871. Finally, he returned to Trinity Hall as Master of his old Cambridge college from 1879 until 1888. His numerous books include *Ancient Law* (1861), *Village Communities* (1871), *Lectures on the Early History of Institutions* (1875), *Dissertations on Early Law and Custom* (1883), and *Popular Government* (1885). In the

second half of his life, he acted as an advisor on colonial policy to many different British politicians and administrators. He married in 1847 and had two sons.

Maine's most famous book was *Ancient Law*, a pioneering study in comparative and historical jurisprudence, whose approach was encapsulated in its lengthy subtitle, *Its Connection with the Early History of Society, and Its Relation to Modern Ideas*. Throughout his career, Maine assumed that there had always been an intimate and important connection between "social life," in a broad sense of those words, and the coercive rules known as "laws," and that modern ideas about legislation (and other kinds of law) also bore the imprint of this connection. For example, *Ancient Law* included the famous aphorism that the "movement of the progressive societies has hitherto been a movement from *Status to Contract*" (Maine [1861] 1986, 140–41), a phrase that encapsulated Maine's central argument about the change in attitudes to rights and duties over time. Nevertheless, Maine's last book, *Popular Government*, was much more pessimistic about the result of this evolution for Western civilization in his own times, and it argued that, in both Britain and the United States, recent state legislation was tending to supplant contract as the regulatory principle of society by assigning rights and duties arbitrarily, thereby returning society to a new kind of "status" system.

According to Maine, at certain points in history, force and power had been dominant factors in explaining social change, while at others, legal systems—and in particular certain legal conceptions, such as fictions, equity, and legislation—had been relatively effective in changing human behavior. However, legal and quasi-legal language (such as "the law of nature") often entered political debate directly with uncertain and sometimes unfortunate consequences. It is thanks to arguments like these that today much of Maine's academic and policy work seems both complacent and conservative; his political sympathies were Peelite in the 1840s and 1850s, but anti-Gladstonian by the 1880s; and he seems to have taken the existence of the British Empire as a *sine qua non* of future progress in both India and elsewhere. Yet he did express some sympathy for the legal disabilities of women (which he traced back to the ancient patriarchal family, and to Roman and Canon Law in Chapter Five of *Ancient Law*), and Maine usually

assumed that a complete system of free agreements between individuals would avoid the worst evils of class government, which he periodically referred to in his writings. Contemporary students of both the institutional and sociological branches of political science should find some inspiration in Maine's jurisprudence, in particular, when they interface with linguistics, anthropology, and history.

Maistre, Joseph de

Maistre, Joseph De

529

530

Maistre, Joseph de

Joseph de Maistre (1753–1821) was a Roman Catholic counter-revolutionary thinker primarily remembered as an early proponent of conservatism, sociology, and ultramontanist (which emphasized the authority of the pope in the Catholic Church and in European politics). He was born and raised in Chambéry, then part of the kingdom of Piedmont-Sardinia. Trained for the magistracy at the University of Turin, he put together one of the finest libraries in Savoy and eventually became a senator of the province.

When Savoy was invaded by the French revolutionary army in September 1792, Maistre became the only senator who chose to exile himself and his family rather than live under a revolutionary government. Having fled to Switzerland, he began there a new career as a counter-revolutionary propagandist. His *Letters of a Savoyard Royalist* (1793) first publicized his monarchist views, but it was with the *Considerations on France* (1797) that he came to prominence. In this pamphlet, Maistre theorized the French Revolution as a providentially regenerative punishment with the power to exhaust all passions. He also predicted that, with time, the counter-revolution would triumph and the monarchy would be reestablished in France—a prediction that brought him fame as a political prophet when Louis XVIII returned to the French throne in 1814.

The *Considerations* was informed by two treatises that Maistre composed in 1794–96. Published posthumously, *On the State of Nature* and *On the*

Sovereignty of the People are refutations of Jean-Jacques Rousseau that contain most of Maistre's political thought in embryo. Developing a historical view of politics, they also reveal his theoretical contribution to the birth of moral statistics.

In 1799, after fleeing France's revolutionary armies for months, Maistre settled in Sardinia, where he served as regent until 1802 before being sent to St Petersburg, Russia, as the extraordinary envoy of Piedmont-Sardinia. He remained in Russia for 12 years, moving in aristocratic circles and meeting learned people from all over Europe. It was the most intellectually productive period of his life.

Maistre expressed his constitutionalism in his *Essay on the Generative Principle of Political Constitutions* (composed 1809). Eulogizing the English constitution as history's work of art, the *Essay* argued that unwritten constitutions are superior to written ones because, encoded in the hearts of peoples and the customs of nations, they are creative like God's living, spoken word. Written constitutions, by contrast, are less effective because once laws and principles have to be written down, they lose by the same token their power to sway. This, he opined, was why France's revolutionary governments produced written legislation in unprecedented quantities but remained powerless to impose the order for which all government must strive.

In St Petersburg, Maistre also composed the *Examination of the Philosophy of Bacon* (completed 1814), which refutes Baconian epistemology with a view to sapping the theory of knowledge of the *Encyclopédie*—and, by extension, the science-based system of education that Alexander I's minister, Mikhail Speransky, was devising for Russia. Against Bacon's materialism and indirect empiricism, Maistre defended innatism, Aristotelian logic, direct empiricism, and the study of the classics.

Maistre's *St Petersburg Dialogues, or Conversations on the Temporal Government of Providence* (1821), is a Neoplatonic theodicy that focuses on the problem of evil to describe a moralized universe where prayer, sacrifice, and prophecy are determining historical agents. Its relatively peaceful, Leibnizian vision is complemented by that of the *Clarification Concerning Sacrifices* (1821), a mystical text that is also the first treatise in

the sociology of violence. In the latter, Maistre puts forward the theory of the reversibility of merits: that the just suffer to save the guilty, and that the practice of sacrifice reintegrates society.

Maistre founded political ultramontanism in his magnum opus, *The Pope* (1819), which argues that the popes created European political culture by founding European monarchy, and that the tension between church and state that characterized European history across the centuries encouraged a uniquely libertarian politics. In the Middle Ages, kings and subjects were bound by a divine law that forbade the former from becoming despots, and the latter from rebelling. In modernity, however, state power grew unchecked as monarchs subjugated churches, thereby creating the conditions necessary for revolutionary tyranny. Maistre offered solutions to this conundrum by looking forward to a new age when the popes would become moderators of political crisis.

In all, Maistre was an original and versatile thinker whose thought is distinguished by its extremely diverse theoretical posterity and by the interest it inspired in friends and foes alike: Royalists, socialists, Hegelians, Romantics, positivists, sociologists, and traditionalists all wrote on him in the nineteenth century, as did fascists, monarchists, and Marxists in the twentieth.

Malthus, Thomas Robert

Malthus, Thomas Robert

530

531

Malthus, Thomas Robert

Thomas Robert Malthus (1766–1834) is notable for having made *population*—its size and growth rate—a central consideration in the analysis of a wide range of economic and social issues. One of the founding members of the British classical school of economics, Malthus is credited with co-discovering the marginal theory of rent and with demonstrating an understanding of the instability of capitalism far in advance of his fellow political economists. But it is mainly for his incorporation of population into policy analysis that he has a place in any complete account of the development of a conservative perspective in nineteenth-century British political thought.

Malthus was born in rural southern England in 1766, graduated from Cambridge University in 1788, was ordained a deacon in the Church of England in 1789, and published the first (anonymous) edition of his *Essay on the Principle of Population* in 1798. He married in 1804 and the following year was appointed to the chair in modern history and political economy at the East India College, Haileybury, northeast of London, a position he held for the rest of his life. His major work in economics, *Principles of Political Economy*, was published in 1820. Malthus died in 1834 while on a visit to his wife's family near Bath, England, and his remains are interred in the Bath Abbey.

In the 1798 *Essay* Malthus took issue with the utopian optimism of the French political visionary Condorcet and, more pointedly, with the English

philosopher and novelist William Godwin. Both Condorcet and Godwin hoped and expected to see radical changes in society through a natural evolution toward more egalitarian forms of property-holding. Their utopianism also found expression in some peculiar ideas about organic human perfectibility, such as lengthened life spans, reduced need for sleep, and a lessening of sexual appetite. In *Essay*, Malthus dismissed such notions as unfounded and unrealistic. Just as unfounded, he added, were sweeping claims that society was headed toward indefinite improvement. A utopian society, he contended, would collapse under the weight of excess numbers. It was an argument previously rehearsed (1761) by the Scotsman Robert Wallace but given additional clarity and force in Malthus's hands.

In Chapter X of his 1798 essay, Malthus launched a frontal assault on Godwin's "beautiful society" characterized by equalization of property and the absence of the marriage contract. According to Malthus, with property shared by all according to their wants and not according to their contributions to production, total output of food and other goods would surely fall. Meanwhile, with the marriage contract put aside, and with it the clear obligation to support one's own children, normal constraints on early marriage would no longer be felt, and population would take off. The pressure to grow more food to feed the ever-expanding population would run up against diminishing returns in agriculture. Sadly, "within fifty years, violence, oppression, falsehood, misery, every hateful vice, and every form of distress" would return, and all on account of "laws inherent in the nature of man" (Malthus 1798, 80).

The antiradical tone and substance of the 1798 essay, with its implicit—verging on explicit—endorsement of the "established administration of property," suggests the usefulness of Malthusian modes of argument in the hands of later political disputants. Any payment to labor in excess of a subsistence wage, for example, may be seen as self-defeating if, as Malthus sketched out in Chapter II, it would lead to a long-term labor supply response that would ultimately push the wage rate back down to the subsistence level. That line of argument lies behind what came to be known as the "iron law of wages." (Malthus himself did not name the "law.")

Malthus's conservative credentials are further demonstrated in his outspoken opposition to the English Poor Law, announced in the first edition and strengthened in subsequent editions of *Essay*. In 1798, Malthus attacked Prime Minister William Pitt's 1796 proposal to adjust Poor Law payments to the number of children in a claimant's family. That, argued Malthus, would offer a premium to child-bearing. As such, it would raise demand for food and do nothing to increase supply. In the second edition of *Essay* (1803), Malthus went further, calling for the outright abolition of the Poor Law, although on a gradual schedule that would give everyone plenty of advance notice. His anti-Poor Law views have generally been seen as helping to shape the political climate in which the Poor Law Amendment Act, tightening the terms on which the poor could claim assistance from the state, was passed in 1834.

Mao Zedong

The achievements and calamities of the Chinese Communist Revolution were intertwined with the political thought of Mao Zedong (1893–1976). Mao's ideas enabled the success of a massive peasant movement, resulting in a historic social transformation that vastly improved the lives of millions of people. In the last two decades of his life, Mao's concepts became entangled with huge disruptions in China at great human cost. Maoism had worldwide impact, appearing in different guises and degrees in France, Albania, Peru, Nepal, Cambodia, the Philippines, and India, as well as in Argentina, Chile, the United States, and the Basque country.

Born into a well-to-do peasant family, Mao joined the tiny elite studying in modern schools. After the republican 1911 Revolution and the New Culture Movement of 1915–19, a radicalized Mao joined the Chinese Communist Party (CCP) at its founding in 1921. Successful at organizing urban trade unions, Mao worked on the 1923 alliance between the Nationalist Party and the CCP before withdrawing briefly from politics. The emergence of a militant peasant movement in the summer of 1925 brought Mao back to activism, this time as one of the earliest and strongest advocates of peasants as a revolutionary force.

Over two decades of war—civil war against the Nationalists (1927–49) and the Anti-Japanese War (1937–45)—Mao moved from the sidelines to the center of the CCP. He headed armed resistance from rural bases to combine social and national revolutions, envisaging a protracted war that would

culminate with the countryside encircling the cities. After the epic Long March (1934–35), with the Communists driven north by Nationalist armies to a remote base in Yan'an, Mao wrote theoretically on warfare and dialectical materialism, arguing for the Sinification of Marxism. By 1943, he held the highest formal leadership positions, and in 1945, Mao Zedong Thought officially became the Party's guide.

Following the establishment of the People's Republic of China as a unified nation in 1949, after the defeats of Japan and the Nationalist Party, Mao presided over the elimination of the gentry as a class and the restoration of the economy, at first envisioning gradual industrialization on the Soviet model. By 1957, Mao had become disillusioned by the social effects of the Soviet approach and turned to a utopian egalitarian vision with the Great Leap Forward (1958–60).

Radical decentralization and Herculean combat against nature in the Great Leap produced economic chaos and starvation. Mao, having then retreated from direct political activity, became increasingly alarmed at departures from revolutionary goals and, by 1962, began to speak of class struggle within the party itself. Mao's ideological critique meshed with party factionalism and both merged with broad socioeconomic fractures into the Great Proletarian Cultural Revolution (1966–69/76), leading to widespread violence and deep social trauma. After Mao's death, the CCP used his thought, stripped of radical elements, for ritualized, nationalistic ends, while his broader intellectual impact continued to be felt in complex ways.

Before becoming a Marxist, Mao Zedong showed traits that would mark his mature thought. In a time of collapsing social norms, his early writings stressed the active self and individual will. Mao emphasized the present moment in a cosmos of motion and conflicting dualities. Self-realization and moral integrity arose out of an unending process of overcoming obstacles.

These early concepts, fed by concrete military experience as well as classical military writings and Daoism, fledged in the dialectical materialism of "On Practice" and "On Contradiction" (1937), essays that in the 1960s would influence Louis Althusser and Alain Badiou. A materialist epistemology of the unity of knowledge and action and a dialectical system

of contradictions, Mao's was a method for action and struggle, stressing humans' conscious dynamic role combined with practical experience, rather than a static conceptual system.

Departing from Marx's historical materialism, Mao's thought resembled aspects of Russia's Narodism. Mao looked to peasants, not to the proletariat, for the agent of radical action and took China's backwardness as a virtue, allowing the bypassing of capitalism en route to socialism and beyond. He saw class in terms of political attitude rather than of socioeconomic structure and severed Lenin's direct connection between party and class. Mao envisioned an unending revolutionary process in which, led by consciousness, changes in the relations of production preceded changes in the means of production. History was not determinative as a restraint on, or a guarantor of, the future.

Having earlier grounded the active self in practical experience, the later Mao tilted toward an unrestrained voluntarism while doubting objective forces of materialist history. Reminiscent of Georg Lukács and Antonio Gramsci, he emphasized subjectivism, cultural critique, and the remolding of humanity. Remaking the human spirit through overcoming hardships and through self-sacrifice in serving others resonated with a traditional moralism and colored Maoist politics.

Reactions to Mao match the extent of his impact on human lives. Abroad, dramatic criticisms of his personal and political life, dismissive of ideas, have mixed with more nuanced assessments of Mao's ideas in relation to their implementation.

To China's population, Maoist ideals have offered a counterpoint to increasing social division, while the neo-Maoism of a small group of intellectuals took political shape in the failed ambitions of Bo Xilai, Chongqing party secretary from 2007 to 2012, who deployed Cultural Revolution tropes in a Red Culture movement.

535

Marcuse, Herbert

Herbert Marcuse was born to an affluent assimilated Jewish family in Berlin in 1898. During the revolutionary activity at the end of World War I, Marcuse served briefly in a soldiers' council, where he participated in the street fighting that convulsed Berlin at this time. In the following years, Marcuse pursued a doctorate in modern German literature at Humboldt University in Berlin and Albert Ludwig University in Freiburg. In 1922, he graduated *magna cum laude* with a dissertation on "The German Artist-Novel," which was influenced by Georg Lukács's early *Theory of the Novel* and which anticipated many of his own later writings on the critical and utopian role of autonomous art in modern capitalist societies.

Like many other intellectuals of his generation, Marcuse was greatly impressed with Martin Heidegger's *Being and Time*, published in 1927. Marcuse returned to Freiburg in 1928 to study philosophy with Heidegger, and in 1933, he completed under Heidegger's direction a *Habilitationsschrift* (a second dissertation required for German academics) on *Hegel's Ontology and the Theory of Historicity*. Yet Marcuse's enthusiasm for Heidegger's work declined steadily while he was in Freiburg, and when the latter openly embraced National Socialism in 1933, Marcuse chose to accept a position with Max Horkheimer's Institute for Social Research, which was in the process of relocating from Frankfurt to New York City. During the 1930s, Marcuse wrote a series of philosophical essays for the Institute's now-famous journal, the *Zeitschrift für Sozialforschung*. Marcuse's work in the 1920s had been heavily influenced

by the phenomenological and vitalist critiques of positivism that dominated philosophical discussions in the Weimar Republic. By contrast, his essays from the 1930s were characterized by a positive reassessment of the tradition of philosophical rationalism. This reassessment culminated in a major study, *Reason and Revolution: Hegel and the Rise of Social Theory* (1941), which was intended to demonstrate historically the Hegelian-Marxist foundations of the Institute's work and to dispel the myth—widespread in Anglo-American academic circles—that Hegel was a precursor of National Socialist authoritarianism.

In 1942, Marcuse accepted a position at the Office of Strategic Studies (OSS), which had been recently founded by the U.S. State Department to conduct intelligence activities against the Axis powers. After leaving the OSS in 1951, Marcuse conducted research at Harvard and Columbia universities for his study *Soviet Marxism: A Critical Analysis* (1958). Striving to maintain independence in the polarized political and intellectual climate of the early Cold War, Marcuse analyzed the Soviet Union largely in terms of the triumph of technological rationality, whose repressive manifestations could also be found in the West. During this time, Marcuse also completed *Eros and Civilization: A Philosophical Inquiry into Freud* (1955). Drawing on the Freudian-Marxist theoretical position developed by Horkheimer and Erich Fromm in the 1930s, Marcuse argued that modern capitalist societies were now in a position to abolish the “surplus repression” and alienated labor that had been necessary in their early phase of historical development and thereby to create new, more emancipated forms of society and subjectivity.

Marcuse's next book, *One-Dimensional Man: Studies in the Ideology of Advanced Industrial Society* (1964), contained a scathing critique of contemporary Western capitalism, which, according to Marcuse, used its massive intellectual and technological resources not to abolish poverty and exploitation but instead to create more sophisticated forms of social domination both at home and abroad. Marcuse's sophisticated critique of this “society without opposition” quickly established him as one of the most important theoretical points of reference for the New Left and the burgeoning global protest movements against global capitalism and its repressive offshoots. In the following years, Marcuse became an active,

public supporter of these movements. He appeared frequently in Europe and the United States at student-initiated protests and discussions, and he devoted his next two short books—*An Essay on Liberation* (1969) and *Counter-Revolution and Revolt* (1973)—to working through political, philosophical, and social-psychological problems that had been raised practically by the 1960s movements.

On the other hand, Marcuse had always been critical of anti-intellectual and sectarian tendencies in the protest movements, and when these tendencies gained the upper hand in the early 1970s, Marcuse distanced himself from them. In response to the violence of the Red Army Faction in Germany in the mid-1970s, Marcuse proclaimed unequivocally, “Murder is not a political weapon” (Marcuse 1977, 7). Accordingly, Marcuse viewed feminism and the new ecological consciousness as the most promising offspring of the 1960s protest movements. Marcuse’s final book, *The Aesthetic Dimension: Towards a Critique of Marxist Aesthetics* (1978), brought him full circle to his earliest concerns with autonomous art as a “second dimension” of reality, which stubbornly preserves the objective possibility of overcoming the unnecessarily repressive, exploitative, and alienating forms of human relations developed in modern capitalist societies.

Market Socialism

Market socialism

535

538

Market Socialism

At its simplest, market socialism describes an economic and political system that combines the principles of social ownership of the economy with the continuing allocation of commodities (sometimes including the allocation of labor) through the mechanism of markets. Socialism has often been seen as a political and economic creed which is defined by its hostility to the existence of markets and their outcomes but, beyond a utopian vision of a world totally transformed, advocates of socialism have almost always envisaged *some* role for private possessions and for markets (in foodstuffs and other goods for small-scale private consumption, for example). And for market socialists, it is not markets but capitalist markets; that is, markets which inscribe the social and economic power of private capital, that are objectionable. Market socialists offer an alternative model in which markets are combined with varying forms of the social ownership of capital. Among these supporters of a socialist alternative, markets thus re-constituted are recommended not only as a way of attaining greater economic efficiency under socialism but also as a way of securing greater individual liberty or a more equal value of liberty, of promoting effective democracy and of enhancing social justice. One further key virtue of market socialism among its contemporary advocates is its political feasibility. For them, it is a form of socialism which could attract popular support and be implemented in a world something like that which we know and inhabit.

The very earliest socialists, writing in the 1820s and 1830s, did not generally look to the state as a vehicle for socialist transformation and there

is a non-statist tradition of reconciling markets with socialism which both predated and survived the rise of state socialism from the mid-nineteenth century onwards (for instance, in the writings of the British Owenite William Thompson). Both as consumers but more especially as producers, the idea of workers' co-operatives was an important theme in socialist thinking in the nineteenth century. Examples can be found in the writings of Charles Fourier, in the practice of the Rochdale Pioneers and in the life and work of Robert Owen. We find it also in the mutualism or workers' self-organization advocated by Pierre-Joseph Proudhon, itself the forerunner of a continental tradition of *autogestion* or workers' self-management. But the history of a distinctive idea of market socialism really begins as a reaction to the emergence of state socialism, above all in its authoritarian Soviet form, and the inefficiencies and inequities associated (in the eyes of its critics, necessarily associated) with this form of a centrally planned economy. Thus the first reported use of the specific term *Marktsozialismus* is attributed to the German economist Eduard Heimann, writing in 1922.

Langean Market Socialism: The Socialist calculation Debate

This first manifestation of market socialism is associated, above all, with the work of the Polish economist Oskar Lange, writing in the 1930s. Lange was himself responding to a criticism made of the newly emerging centrally managed economies by the Austrian economist Ludwig von Mises, who insisted that without markets and their price signals, there could be no rational economic calculation. In essence, he suggested that the idea of a rationally planned economy was an oxymoron. Lange's response was to insist that rational calculation was indeed possible under socialism because the state's Central Planning Board could act as a surrogate for the market by setting prices (and the institutional context for socialist enterprises) and then adjusting these prices through a repeated "trial and error" procedure, so as to respond effectively to fluctuations in supply and demand. The ensuing argument has been labeled the Socialist Calculation Debate. In general, the judgment has been that Lange probably got the math right—it was possible to imagine an enormous simultaneous equation through which prices could be calculated—but that his solution failed as a response to the

Austrian economists' challenge, not least because markets did very much more than disclose prices; their disequilibria showed where unmet demand existed and provided both the signals and the incentives for innovative and entrepreneurial behavior.

As well as attempts to inaugurate something like mutualism elsewhere in the world, there were from time to time through the following half-century attempts to effect some sort of decentralization of economic activity in the Soviet bloc—though these tended to be undermined by the political imperative to retain control from the center. Where nationalization took place in the West, both before and after the Second World War, it tended to follow a public corporation rather than a workers' control model. By far the most widely discussed experiment in this period was the experience of workers' self-management in Yugoslavia which followed the latter's partial break from the influence of the Soviet Union after the end of the Second World War under President Josip Tito. Much was written about the Yugoslav experience and much of this commentary was intensely partisan. Advocates tended to contrast the comparative successes and openness of Yugoslavia with countries more fully within the Soviet sphere of influence; critics tended to contrast its limited economic success and political freedoms with the societies to its west. Yugoslavia in this period undoubtedly represented a real experiment in some sort of workers' self-management, but this collapsed along with the state of Yugoslavia at the end of the 1980s.

The “New” Market Socialism: The 1980s and Beyond

The ideas of market socialism were revived and reassessed under quite different circumstances in Western Europe and North America in the 1980s and 1990s. The context here was the ascendancy of a newly assertive market capitalism, personified in the political regimes of Ronald Reagan and Margaret Thatcher, and a corresponding loss of faith in the models of social democracy that had dominated the mainstream left since 1945. After 1945, the reformist left in Western Europe (and beyond) had come very widely to endorse a social democratic political program. In essence, this

meant retaining a broadly capitalist market economy but moderating its outcomes (both social and economic) by an active economic role for the state, above all through the support of full employment, progressive taxation, and an expansive welfare state. This was the era and strategy of the Keynesian welfare state (KWS). The ascendant New Right, or neo-liberalism, insisted on a politics of less state and more (capitalist) market. There was a view among some on the left, not only that this pushed social democratic parties rightwards but that actually the whole social democratic reform strategy (taking the capitalist market economy much as it was but seeking to achieve social change through redistributing its product) no longer worked. Since the Soviet Union had very long since ceased to offer an attractive alternative (and in 1991, ceased to exist altogether), there was a quest to find an alternative that retained and enhanced the advantages of living in an affluent liberal democracy but with a more democratic and equitable economy. For some, at least, the answer was a form of market socialism.

At the heart of this new model of market socialism was the abolition of large-scale private ownership of capital and its replacement by some form of “social ownership.” There was considerable variation in what this “social ownership” might look like. One of the key advocates of reform was the economist and expert on the Soviet economy Alec Nove, who identified three possible models: an economy built around (1) centralized state corporations, (2) socialized enterprises (socially owned but not centrally directed) or (3) workers’ co-operatives. Although Nove tended to prefer the first of these options, most market socialists were drawn towards the more decentralized, co-operative form. Although the precise institutional form varied, the general sense was that groups of workers might use capital and would derive their incomes from their deployment of it, but would not be the owners of that capital which would remain, in the last instance and in some way, collectively owned by society. The aspiration seems to be that labor should be the sole source of *earned* income (although there were and are other criteria according to which society may want to provide income to its citizens). One shorthand way of describing this relationship is that in a market socialist economy, labor hires capital rather than capital hiring labor (though there are economists who insist that these two are materially the same thing). Most market socialists retained some place for the private

ownership of capital (they all allow of the private ownership of non-capital goods) as the price of innovation and perhaps of personal liberty. However, they sought to distinguish between a (perhaps generous) reward for the scarce skill of the genuine entrepreneur and the rents claimed by those who brought nothing to the productive process but their ownership of the scarce resource, capital.

Given the preference for the worker co-operative form, much attention in the recent market socialist literature is devoted to the question of enterprise structure and governance. How are workers' cooperatives to be formed and (more problematically) shut down? Who will take day-to-day managerial decisions? How is authority to be exercised within the workplace? Can there be differential wages (for skill and effort)? Must workers make some financial commitment to their enterprise? Can they withdraw value when they leave? May a co-operative employ additional workers who are not part of the co-op itself? There is a widespread suspicion among mainstream economists that the perverse incentives set up by workers' co-operatives mean that they will tend to underinvest, fail to take up new market opportunities, restrict the expansion of employment, and dissipate the enterprise's working capital. In the real world of co-operatives, there is some evidence that workers in co-ops actually self-exploit (paying themselves low wages and working long hours).

There is an extensive literature that seeks to address these supposed weaknesses of a labor-managed economy—some of it is theoretical, some of it based upon the experience of co-operative enterprises, including successful experience in the plywood industry of the north-western U.S., in the “third economy” of northern Italy and perhaps above all, in the Mondragon complex of associated co-operatives based in the Basque region of Spain and employing in excess of 80,000 people in 2010. Supporters of market socialism argue that this lived experience shows that some of the “theoretical” problems associated with a labor-managed economy can be overcome—that workers do succeed in appointing managers who are able to manage, that co-operators can be given incentives that will prevent them from dissipating all the capital in an enterprise, and that the issue of “insiders” and “outsiders” can be overcome. They suggest that labor-managed enterprises may have alternatives to capitalist labor markets which

divide the population into the “employed but over-worked” and those with no paid work at all. Skeptics doubt that any of these solutions could be extended into a generally labor-managed economy and are, in some sense, parasitic upon a wider (and capitalistic) market economy.

Prospects

The immediate prospects for a market socialist future look unpromising. While one of the great attractions of market socialism has been its supposed feasibility, it is actually hard to see how an incremental path to market socialism could be established. (Its social democratic forerunner, however unsuccessful some have judged it to be, at least had an account of how incremental progress might be made.) What makes market socialism “work” is a very radical (and radically underdeveloped) position on questions of social ownership (i.e., the large-scale socialization of private capital) and it is very hard to see where the political support for this is to be found at present. On the other hand, in a world of intensifying inequality, under-employment, and the unsustainable exploitation of finite resources, market socialism may yet find that its time will come.

Marx, Karl

Marx, Karl

538

544

Marx, Karl

Karl Marx (1818–83) has been a notable figure in modern political thought in three distinct ways. From the 1880s to the 1980s, he was the eponymous icon of Marxism, a collection of political and philosophical doctrines derived from some of his works by commentators and politicians. These ideas were characteristically expressed in dogmatic terms such as scientific socialism, materialist conception of history, dialectical materialism, and the dictatorship of the proletariat. In modern political thought, Marxism was initially and mainly treated as constitutive of wide-ranging and transformative political struggles in the late nineteenth and early twentieth centuries, such as anticapitalist party politics and conspiratorial activity in the West, the Russian and Chinese revolutions in the East, and national liberation movements and Cold War conflicts worldwide.

In the course of the 1950s and 1960s, however, an alternative “humanist” Marx was constructed by philosophers. This was done largely from manuscripts first published in the 1930s in German, and not widely circulated and translated till the post–World War II period. This was Marx before Marxism, or at any rate a Marx in considerable tension with the deterministic science and philosophical materialism on which Marxism had been based. The humanist Marx was said to espouse a “praxis” philosophy arguing a unity of theory and practice, a theory of alienation of the worker from his [sic] productive capacities and his “species-being,” or human essence, a view of the proletarian or working-class person as the universal human subject, and a vision of a revolution that would transform human

social and economic relationships. Within this context, there were notable academic debates on human nature, justice, morality, rights, democracy, gender or “the woman question,” and the human self in relation to property and labor. These are all core concepts in modern political thought to which Marx was made to speak, so in that way he became a political thinker in the current canon.

There is also another, “analytical” Marx, constructed in the 1970s and 1980s almost entirely from a short work (Preface to “A Contribution to the Critique of Political Economy”) that was little known until the twentieth century. The terms of this text—modes, means, forces, and relations of production; property relations; economic structure; real foundation; superstructure; social consciousness; social existence; social formation; as well as development, conflict, “fettering,” and transformation—were meticulously examined and reconstructed in accordance with logical and empirical notions of clarity and rigor current at the time. This Marx was adopted into, but ultimately expelled from, a positivist version of philosophy and social science.

There are thus three versions of Marx of relevance to modern political thought. One is the man who gave his name (perhaps inadvertently, and certainly posthumously) to the major transformative movement in twentieth-century global politics. Another is the man whose early writings inspired commentaries that are now reference points in political philosophy. And the third is the analytical social theorist who linked politics to economics, and economics to technology, albeit unsuccessfully. Ironically the basic concepts that Marx himself noted as his special contribution to critical thinking about human society all derive from a single concept, *class*. However, he never defined this term precisely, and it has been absorbed into modern social thought most centrally in sociology. Overall, Marx’s contribution to modern political thought has been to change the terms through which any credible discussion of politics must take place.

Early Life, Times, and Politics

The facts and narrative constituting Marx’s biography have emerged in relation to the contrasting receptions of his work that have taken place over

time. With the increase in Marx's fame and notoriety since his death, the amount of biographical material has gradually increased. Marx's works, published and unpublished, were almost all obscure in his lifetime, soon out of print, and not easily available. The first widely circulated work to establish a Marx tradition, by producing and publicizing a political and biographical narrative, was the 1872 second edition of the *Communist Manifesto*. A contextualized rather than traditional account of Marx's life, times, and politics reveals that he and his works are problematic today in challenging ways. Marx was born into a Jewish family in Trier in the German Rhineland, an area where constitutional rule and religious toleration were introduced during the Napoleonic occupation of 1806–13. During the conservative reaction that followed, the locality was absorbed into the Kingdom of Prussia, and in 1824, Marx's father converted to Lutheranism in a Catholic area to preserve his living as a lawyer. Karl grew up in a family circle and "alternative" intellectual culture in which the free-thinking values of the Enlightenment were cultivated. This atmosphere involved the use of philosophy and science to establish universal truths relevant to society and politics, and an immediately skeptical attitude toward the commonplace certainties of doctrinal Christianity and political authoritarianism. In the German monarchies and principalities of the day, church and state, Christianity and morality, were decidedly unseparated. From the point of view of the authorities, radical and foreign (i.e., French, English, and American) views linking the legitimacy of the state to the will of the people were suspect to the point of sedition.

After a classical education (including considerable compulsory study of the Bible and Christian dogma), the young Marx was sent off in 1835 at the age of 17 to the University of Bonn to study law and follow his father into the professional classes. At the time, the universities represented an area of limited state toleration for critical views, excluding the twin extremes of atheism and liberalism, both of which were associated with the violence of the French Revolution (1789–99). At Bonn, Marx was little interested in legal training, involving himself instead in student scrapes. He was transferred by his father to the University of Berlin in 1836 to complete his degree. At both universities, the younger Marx fell in with student radicals, who—under the guise of philosophical debate—were subjecting the

authoritarian political structures and quasi-medieval economic arrangements of the German states to scornful skepticism.

In the mid-1830s and early 1840s, Christianity itself, and by implication the legitimacy of the state, had come under scandalous attack in scholarly works on the question of the historical Jesus and the nature of religion. Although the works themselves were not openly atheistic, they alarmed the authorities, who suspected that radicals would draw treasonous conclusions. Even though Marx was not the author of such works, nor yet persecuted for his political opinions and religious skepticism, and although he submitted a dissertation (on Greek philosophy) to the University of Jena by post and so obtained a PhD in 1841, he concluded that he would not be in line for an academic appointment. In any case, he had probably become more interested in involving himself in the politics of thorough-going liberal, but legal, reform.

In a short-lived concession to liberal opinion, the Prussian monarchy tolerated—for a brief time between 1842 and 1843—the publication of newspapers that could report critically on local issues. One of these was the *Rhenish Gazette* in the German city of Cologne. Marx attached himself to it as a writer, and he was eventually—briefly—its last editor. The paper was supported by business interests favoring the modernization of the medieval property system, reform of the laws of contract and incorporation, and liberalization of entry into the professions and trades. Traditional restrictive practices would be dismantled in favor of the free-market relations that these businessmen admired in Britain and France. Moreover they also proposed, albeit timidly, the modernization of the political structures that allocated power to hereditary and other elites, including religious hierarchies. In opposition to this political establishment, they advocated more representation and participation in government by middle-class people like themselves. Marx took up this liberalizing line with enthusiasm. However, he overtly sympathized with workers who were on the laboring side of modern commercial relations, taking his cue from personal contacts with communist radicals and the socialist literature of the day, which was predominantly French.

The Prussian government made the position of the *Rhenish Gazette* untenable in 1843 (the Tsar of Russia had complained to the King about its dangerous liberalism), so Marx withdrew to his study (as he put it later himself) to consider “the social question,” as it was known at the time. The most notable German authority on the subject was the iconic philosopher Georg Wilhelm Friedrich Hegel (1770–1831), whose *Elements of the Philosophy of Right* (1821) was a widely read compendium of modern wisdom on the individual, the family, ethics, politics, economic activities, authority relations, and governmental structures. Although Hegel was deliberately ambiguous and oblique in his writing, the very activity of making philosophy engage at the highest level with these historical and contemporary topics was itself controversial. Also controversial was his refusal to reproduce Christian teachings and moral truths verbatim, and his developmental view that progress comes with an unfolding of the human potential, not from God’s will as such.

Marx took Hegel’s ambiguous conservatism for granted, but like other Young Hegelians, he focused instead on the great philosopher’s subversive potential in opening up contemporary government, the economy, and politics more generally to independent analysis. In particular, Hegel had imported French and Scottish work on civil society and political economy into his scheme, and Marx undertook a critical examination of Hegel’s account in relation to Marx’s own communist views on the centrality of social class in human experience. Only a small fraction of these early manuscript works found their way into print at the time, and as with virtually all Marx’s works throughout his life, they achieved for the most part only the limited readership of German-language radical groups.

After the demise of the *Rhenish Gazette*, the newly married Marx joined other German radicals in 1844 in an emigration to Paris, where they could write and publish more freely, but with a view to clandestine circulation of these materials in the German states and principalities. Marx was soon expelled by the French authorities as a foreign subversive, and with his associates, he moved to Brussels in Belgium in early 1845. The political strategy was twofold: the socialists and communists (the two terms were not at all distinct at the time) worked with middle-class liberals and commercial interests. These reformers were promoting government that would be more

representative of, and more responsible to, the people, meaning only the propertied (male) citizenry. But the radicals also worked against the liberals, promoting the interests of nonpropertied, low-income laborers, particularly the urban poor—among them many German immigrants—who were subject to casual exploitation and frequent unemployment. In keeping with this politics of intellectual emigration and worker migration, Marx and Engels joined an international League of Communists, which linked up disparate groups from various countries. The two secured a commission at their London conference in November–December 1847 to draft a manifesto. The German-language document appeared there in a small printing in early 1848, with plans for immediate shipment to German networks and translations into major languages.

The *Communist Manifesto*

This short, popular work was first published anonymously in 1848 at an expatriate German press in London. Written in conjunction with his lifelong friend (from 1844) and sometime collaborator Friedrich Engels (1820–95), the *Communist Manifesto* is still the best introduction to Marx's political thought. The reader should note, however, that the work is organized around the historical existence of classes and class struggle, and the contemporary politics of fighting for a classless society. Marxist concepts such as materialism, dialectic, scientific socialism, ideology, alienation, species-being, mode of production, social formation, and the like do not appear in the *Manifesto*. These concepts, which are the constituents of later exegesis and popularization, have developed importance over time as Marx's work has been received by commentators and politicians. They are often used as framing devices and organizational signposts, but the extent to which they add to or detract from Marx's message in major works, such as the *Communist Manifesto*, is open to debate.

In terms of modern political thought, the *Communist Manifesto* is a remarkable document, offering—in lively and accessible language—a reconceptualization of human history as the history of class struggles, rather than a history of dynasties and empires, or a moralizing and prophetic account of the relationship between God and humans. Here class is defined in relation to the everyday activities of production and consumption

common to all societies. Hitherto class had been of little interest to historians, other than as a timeless and largely unremarkable backdrop of rich and poor. The text focuses on the commercial classes or bourgeoisie in Europe, explaining their development from petty traders and urban guildsmen in terms of two factors: an increase in demand caused by wealth derived from conquest or trade in the Americas and Asia, and the use of new technologies in Europe to produce large volumes of goods efficiently in response to this influx. The globalization of trade and market-driven innovation in manufacture, so the authors argue, will transform all nations, cultures, and peoples of the world, and at an ever increasing pace. Traditional ways of life, including political structures, will be relentlessly destroyed, and the replacement will be the modern representative state, like the parliamentary systems in Britain and France. This kind of government is merely a committee, so Marx and Engels say, for administering the common affairs of the bourgeoisie, claims to popular sovereignty notwithstanding.

For Marx and Engels, this vast and ongoing bourgeois revolution has two consequences. Increasing inequalities of wealth and power will simplify class structures down to a diametrically opposed bourgeoisie and proletariat; and market-driven allocations of productive resources and therefore wages and salaries will become increasingly volatile and crisis-prone, causing bitter class warfare. As the claims of bourgeois liberals are revealed to be hypocritical and impossible to fulfill for the population generally, the proletarian political movement will rise in numbers and thus represent the interests of the vast majority. National struggles and victories will coalesce into an egalitarian international transformation in economic and political life.

After this sweeping prologue, Marx and Engels zero in on their target audience—low-paid urban workers in modernizing economies—by explaining how exactly the current system of property relations establishes and supports capital. Through these relations the bourgeoisie owns the essential means of production, such as factories and raw materials. Workers, by contrast, lack access to employment, except through the wage contract, so they must compete among themselves for jobs. This competition drives wages down and condemns them to misery. The authors dismiss claims that

these exchanges between proletarians and capitalists are free and fair, as bourgeois interests profess, and argue instead that the property system itself makes what are in reality *social* resources—factories and raw materials—into *private* ones. Marx and Engels thus condemn the capitalist economic system as exploitative in principle and in practice.

According to the *Communist Manifesto*, communists are merely workers—and sometimes a few intellectuals of bourgeois background—who understand these truths, and who help to form the proletariat into a political class. Their goal is the overthrow of the bourgeoisie and the seizure of political power. Proletarian victory will result not in the renewed domination of one class by another but in the abolition of class divisions as such. In such a classless society, political power will no longer be synonymous with the power of one class to oppress another. Rather, society will become an association in which the free development of each underpins the free development of all. In terms of political thought, this vision is clearly a version of the “good society,” calling for the transformation and transcendence of the modern state and property system. However, the text offers few details on how this change would work out in practice.

The *Communist Manifesto* offers two theses of immense importance in the history of modern political thought. One is the stated general view that ideas, culture, social institutions, religions, morals, laws, and political systems have always been formed throughout history in a determinate relationship with economic ownership, practices, and technologies. Marx and Engels comment that the ruling ideas of any age are the ideas of the ruling class. The other thesis is the more historically specific claim that crucial changes in the political configuration of medieval societies arise when improvements in the means of production—and the ambitions of the rising class in control of these forces—cannot be contained within feudal forms of property and law. Medieval authoritarianism is thus subject to overthrow by the modern state, as had already happened in France. The process would continue elsewhere in Europe and on a global scale. Similarly the two authors predict that further revolutions in the technologies and efficiencies of capitalist production will inevitably breach the confines of a legal system that makes social resources into private ones. Capitalist

property relations guarantee the economic and political power of commercial interests at the expense of the working classes. Hence, the *Communist Manifesto* predicts the overthrow of the bourgeoisie by the proletariat—or their common ruin.

Later Life, Hard Times, and Exile

The events of the revolutions of 1848 overtook the communists. Their document played no great part in the liberalizing struggles of the time, although Marx and Engels did, to a limited extent. The two worked on a successor newspaper in Cologne, the *New Rhenish Gazette*, which pursued the twofold political line outlined above. Marx made public speeches, and Engels was briefly involved in an armed retreat of liberal revolutionary forces from the German states into Switzerland. In 1850, he joined the Marx family in another emigration, this time to London, and—as it turned out—for the length of both their lives. Engels worked at the English premises in Manchester of the familial firm of cotton-spinners and merchants, supporting the Marx family through hard times. These included the deaths of two little boys and a girl, and the upbringing of the surviving three daughters. Life in England was safe enough, but Marx and his wife suffered the damaging effects of poverty, dying in their 60s after years of poor health.

As an émigré and disillusioned '48-er, Marx's political activities were limited to his familiar pattern of critical agitation and polemic, pamphleteering and letter-writing. In 1864, he helped to found the International Working Men's Association, later known as the "First International," in London. This was an umbrella organization linking socialist and communist groups, networks, and eventually political parties in Europe and the Americas. Principally, however, Marx was devoting himself to a vast lifetime project—a comprehensive critique of political economy, the economics of his day. To do so, he read widely the standard authors on the subject, such as Adam Smith and David Ricardo, tackling many English-language texts and sources. He struggled to resolve commonplace claims that wage contracts between members of the bourgeois and proletarian classes were an exchange between equals in the marketplace, and that profits were fairly and justly derived by capitalists as

a result. Marx was convinced that he could show empirically that wages tended toward subsistence and that they were in any case subject to sharp practices that were difficult to control, even when legislation and a factory inspectorate were in place.

However, Marx's more ambitious aim was theoretical. He attempted a resolution of the problem of profit: Out of an exchange in which the laborer received as wages the full value of his labor, how then could a profit for the capitalist arise? Either it would have to be a deduction from the value of the labor performed to make the product, or it would have to be some mysterious increase in value arising in the economic process as a whole. Over the next two decades, Marx worked himself tirelessly to draft this comprehensive critique and to get it published, circulated, and translated. His masterwork was *Capital*, vol. 1, published in 1867, with further posthumous volumes and supplements edited from his voluminous manuscripts.

This study was clearly an expansion of the outlook sketched so brilliantly in the *Communist Manifesto*. *Capital*, however, is more focused on the economic theorizing through which the class positions of bourgeois and proletarian are fundamentally defined and politically practiced. It is less obviously concerned with the global sweep of capitalist development and imperialist politics; a planned volume on the world market never materialized, even in manuscript. Although Marx was pleased with his solution to the problem of profit—known as the theory of surplus value—and with his rigorously defined concept of exploitation, these particular conceptualizations have not figured significantly in modern political thought.

Marx and Modern Political Thought

Within modern political thought, an “analytical” school of the 1970s and 1980s focused attention on Marx's short preface to “A Contribution to the Critique of Political Economy,” published in 1859 as a first installment on *Capital*. These Marx scholars viewed the language of the 1859 preface as unusually concise and rigorous. Their analytical school created a Marx

whose work could be tested within the empirical frameworks of mid-twentieth-century social science and historical studies.

Consisting of a brief account of Marx's life and studies to date, and a compressed summary of the general conclusion that guided him, the 1859 "Preface" asserts that political conflicts are rooted in economic circumstances but fought out in terms of ideologies, including religious, artistic, and philosophical forms of social consciousness. It also specifies Asiatic, ancient, feudal, and modern bourgeois modes of production as progressive epochs in the development of society. However, class as an analytical category and class struggle as an overt political perspective were omitted, doubtless because that kind of discussion would have attracted attention from the censors. Similarly the tensions between technological developments and legal systems—whether early modern industry with feudal legal systems or highly productive manufacture with capitalist private property—were expressed in abstract, schematic formulations. The resolution of these somewhat veiled antagonisms was said by Marx to mark the close of human prehistory rather than worldwide proletarian revolution as a specific and stated goal.

These few lines in the 1859 "Preface"—linking social relations of production, material productive forces, the economic structure of society, its legal and political superstructure, and social consciousness in specific forms—reproduce to some extent the more provocative, uncensored formulations of the *Communist Manifesto*. However, they are probably self-censored rather than deliberately rigorous. Ultimately the analytical school found Marx's propositions wanting in relation to the methodological and evidential standards they had adopted from social science and a similar positivism in philosophy.

Although the history of Marxism has been one of successive ideological codifications, beginning with Engels's highly influential polemical works of the later 1870s, both Marxists (in manifold variant versions of "the doctrine") and anti-Marxists have shared common presumptions as to what Marxism actually is. Typically this has involved schematic accounts of scientific materialism, Hegelian dialectics, and historically successive modes of production. More recent approaches to Marx within modern

political thought, based on more sophisticated textual knowledge and analytical methodologies, take a skeptical view of traditional dogmatics and promote a more open-minded and constructive approach to the full range of his voluminous writings.

Overall Marx has shaped modern political thought decisively by resetting the terms for any inquiry into politics. He does so by laying out large-scale claims concerning the nature of power and authority in human communities, the way in which these structures have changed, the way that history up to his own time had recorded those changes, and the directionality that, so he argued, can be discerned in these developments. In modern political thought, there has been for many years no escape from the view that the interaction between political structures and economic activities—however that interaction is conceived—must occupy a central place in any discussion of politics.

Mass Society

Surveying the new workforce crowded into the factories, offices, and cheap housing in the rapidly expanding urban centers of industrial capitalism, mid-nineteenth-century observers were struck by the unprecedented density of population. Some followed Karl Marx in identifying a new class structure. Others saw only an undifferentiated “mass” and a social order increasingly built around the interests, opinions, and tastes of the majority. Responses to this emerging “mass society” were sharply divided between those who lamented the passing of the old hierarchical order and those who welcomed the construction of a more egalitarian and democratic society. Both identified a central fault line running between the masses and the social and intellectual elites.

Aristocratic and conservative commentators saw themselves battered on all sides by the emergence of mass markets in cultural expression and political loyalty. For them, the mass was an unashamedly destructive force, tearing down the citadels of hereditary and expert privilege and imposing mediocrity. They drew a fundamental moral distinction between the noble and the common. Friedrich Nietzsche, writing in 1888, did not doubt that by marginalizing the old spiritual elites, the onward march of the “great majority” of “mediocre ones” was undermining the moral integrity of society. This argument was forcefully restated by José Ortega y Gasset in *The Revolt of the Masses* (1930). Defining nobility as a personal disposition “synonymous with excelling oneself” rather than a social status, he cast the mass as its implacable enemy, crushing “everything that is different,

qualified and select” and settling for “the stock of commonplaces, prejudices, fag-ends of ideas” (ch. VIII). This assumed leveling down was felt particularly acutely by those writers and literary critics who appointed themselves custodians of cultural tradition and “informed and cultivated judgments.” *Mass Civilisation and Minority Culture* (1930), the attack on bestsellers and commercialized cultural production launched by the English critic F. R. Leavis, adroitly expressed their anger and regret.

For other observers, including anxious liberals, it was the new political marketplace that prompted most concern. Although he supported the extension of the franchise, England’s most passionate defender of personal liberty, John Stuart Mill, cautioned in *On Liberty* (1859) that in appealing to voters by ventriloquizing popular feeling, elected politicians were replacing the old tyranny of autocratic rule with a new “tyranny of prevailing opinion” that actively suppressed the individuality and dissent essential to democratic debate, self-realization, and the advancement of society.

In contrast, other democratic observers saw the “mass” as the target of power, not its agent. Uprooted from the social and moral solidities of village life and cast adrift in the capitalist marketplace and the anonymous city, members of the new mass appeared highly vulnerable to appeals from demagogues and dictators who played on their frustrations and hopes. This concern was supported by commentary on collective behavior that characterized the mass as a collection of isolated, rootless individuals, a psychological crowd, all too readily influenced by the suggestions carried by vivid imagery and stirring speeches. The experience of mass mobilization for World War I seemed to confirm this analysis and to underline the persuasive power of the proliferating mass media. Democrats’ worst fears were confirmed by the rise of Fascism and Nazism in Europe in the 1930s and Hitler’s concerted orchestration of popular spectacle and propaganda.

The Allied victory in World War II did not entirely allay these fears. On the contrary, a number of democratic commentators saw the postwar United States as a new kind of mass society. They pointed to the concentration of power at the top, the seductiveness of the new medium of television, the social isolation of the suburbs and the automobile, and the erosion of

citizenship as the immediate democracy of consumption and the shopping mall successfully challenged the attenuated democracy of the ballot box. These concerns were distilled in the titles of two influential books of the time, David Riesman's *The Lonely Crowd* (1953) and C. Wright Mills's *The Power Elite* (1956).

However, in the 1950s, with the resurgence of the Civil Rights Movement, the mobilization against the war in Vietnam, and the growing demands for gender equality and sexual rights, this image of a compliant mass became less credible. At the same time, communication research was dismantling theories of powerful and direct media effects and reconstructing audiences as active, selective, and sometimes resistant. As a consequence, over the past three decades, the portrayal of capitalist democracies as mass societies has moved from being an active conceptualization to becoming an episode in the history of ideas.

Mazzini, Giuseppe

Mazzini, Giuseppe

546

Mazzini, Giuseppe

The principal ideologue of Italian unification, a leading exponent of democratic nationalism, and an influential social thinker, Giuseppe Mazzini (1805–72) was born into a respectable middle-class family in Genoa, a few weeks after the incorporation of the city into the French empire of Napoleon Bonaparte. As a young man, he was heavily influenced by Romantic thought, and throughout his life, he never lost his belief that faith and passion were essential to political action. A turning point in his life, he later claimed, came in 1821, when he encountered Italian patriots leaving Genoa for exile after a failed patriotic rising in Piedmont: From that moment, he vowed to dedicate himself totally to the cause of Italian freedom.

After graduating in law in 1827, Mazzini joined the secret society of the *Carbonari*, and he was arrested and imprisoned for conspiring to bring down the monarchy of Piedmont-Sardinia. He went into exile and spent periods in France and Switzerland before moving in 1837 to London, where he was to live for most of the remainder of his life. In 1831, while in Marseilles, he set up Young Italy, a political movement that sought far more explicitly than earlier secret societies to work for Italian unity and the education of the masses. Education—understood principally in terms of the moral elevation of “the people”—remained an abiding concern, and much of his huge output of letters, pamphlets, and essays was geared to raising public consciousness, especially in relation to the principle of national independence and freedom.

Mazzini's views on nations and nationality were formed early and hardly changed throughout his life. He believed God (and religion was central to his political vision) operated through peoples and that it was the particular duty of Italians in the nineteenth century to work for the unity of their country and spearhead a new European order of free nations. Mazzini never offered any rigorous definition of a nation: He preferred instead to point to "indicators" such as shared language, history, and customs. Italy's particular "mission" (one of his key concepts) was linked to his idea of Rome's universal role: The "third Rome" (after that of the Caesars and the papacy) would be the Rome of the people. The implementation of the national principle would further the progress of humanity and lead ultimately, he maintained, to universal peace. Although a convinced republican, Mazzini did not specify a preferred constitutional arrangement: What was crucial was that it was sustained by the will of the people.

Mazzini worked tirelessly from his base in London to promote the cause of Italian unity, build up networks of supporters, and encourage popular insurrections. He harbored a religious conception of political action: Risings might fail, but in demonstrating faith and conviction, they could win support for the cause. His stress on duty, the moral improvement of the working classes, and his opposition to socialist ideas of class conflict made him an influential figure in British radical circles in the 1840s and 1850s. In 1849, he returned to Italy, and he won many plaudits for his leadership of the Roman Republic. After the collapse of the Republic, he spent time in France and Switzerland before returning again to London.

The failure of the revolutions in Italy in 1848–49 marked the beginning of a steep decline in Mazzini's influence. His dogmatic character and rigid insistence on republicanism and popular insurrection alienated numerous supporters. His disastrous attempt at an insurrection in Milan early in 1853 was for many the last straw. Italian patriots now looked increasingly to Piedmont, under the progressive liberal leadership of Count Cavour, and to diplomacy rather than to revolution, as the best means of achieving Italian independence and unity.

Mazzini played only a peripheral role in the events that led to the unification of Italy in 1859–60. He was deeply despondent about the

political outcome, seeing the new Kingdom of Italy more as an imposed extension of Piedmontese power than an expression of the will of the Italian people. During the 1860s, he continued to work from London to promote republicanism and urge the seizure of Rome and completion of Italian unity. However, his influence within Italy was limited, and by the time of his death in 1872, he had become a largely isolated figure. His virulent opposition to socialism had also left him increasingly marginalized in working-class politics.

Although his career was in many respects one of failure, Mazzini's passionate commitment to democratic nationalism and the moral elevation of the masses made him an inspirational figure for many national movements in the twentieth century.

Merleau-Ponty, Maurice

Merleau-Ponty, Maurice

546

547

Merleau-Ponty, Maurice

Maurice Merleau-Ponty (1908–61) belonged to a generation of radical thinkers that emerged from France's experience of World War II. His philosophy covers a huge range of interests, from the scientific theory of relativity to aesthetics. It includes many essays as well as two books—*Humanism and Terror* (1947) and *Adventures of the Dialectic* (1955)—on politics. His principal aim in all these studies was to reveal the world's contingency and to show that claims to ultimate truth not only rely on untenable assumptions but also result in closed systems of thought that block the rich, complex emergence of existence. He argued that such closure is intrinsically aligned with an impoverishment or neglect of lived experience and, in politics especially, with violence. In this sense, all his work can be seen as having a political orientation insofar as its account of co-existence—as a hazardous process of negotiation with no guarantee of a happy outcome—challenges modern rationalism and its understanding of the political. The exemplary thinker from this perspective is Niccolò Machiavelli, whom Merleau-Ponty thought was more attuned to the messy, strategic nature of political life than, say, a moralist like Immanuel Kant.

Merleau-Ponty was influenced by Georg Wilhelm Friedrich Hegel and Karl Marx, drawing in particular on their youthful writings. He also engaged throughout his career with the founders of phenomenology, Edmund Husserl and Martin Heidegger, earning himself the accolade of being the greatest French phenomenologist. What attracted him was a mode of interrogation that strives to return to the lifeworld: that realm where

embodied experience emerges prior to its thematization in rational concepts. From this perspective, he could question underlying presuppositions that underpin scientific or philosophical concepts, while insisting that these remain anchored in and engendered by nonrational experience. From Heidegger, he took the view that we are thrown into the world and respond to it practically before we think about it rationally. Indeed, Merleau-Ponty's entire philosophy rests on his phenomenological premise of the primacy of perception. It is from the practical responses of the body to its situation that corporeally significant meaning first emerges, and if this lived experience is subsequently overwritten by reason, the ambiguities inherent in life are never adequately confronted. This position has far-reaching consequences for our understanding of the political and for the practice of politics.

Merleau-Ponty's phenomenology is inseparable from his existentialism. Together with Jean-Paul Sartre and Simone de Beauvoir (Merleau-Ponty and Sartre were political co-editors of the existentialist journal *Les Temps Modernes* until a famous quarrel in the mid-1950s), Merleau-Ponty wrote under the banner of the existentialist movement, sharing his colleagues' project of formulating a humanist Marxism attuned to problems of commitment, freedom, and consciousness as well as to social and economic change. Although he later proclaimed the movement dead, he continued to theorize from the perspective of lived experience: In his later work, Merleau-Ponty struggled to describe the ontology of existence from a post-humanist perspective, endowing it with the distinctive label of Flesh.

Merleau-Ponty commented extensively on political developments during the 1940s and '50s, practicing the sort of critical analysis he associated with the engaged intellectual. In particular, he refused the either/or politics of the Cold War, arguing that France should refuse to take sides in a conflict that had been reduced to two crudely opposed ideologies, both of which he charged with being ignorant of the complexities and ambiguities of the political and prone, as a consequence, to excessive violence, even terror. Rather than condemning political regimes on the basis of their ideological self-presentation, his existentialism required an ongoing interrogation of the relationships and modes of existence they actually afford. It is from this perspective that he judged both liberal capitalism and Soviet communism wanting, while recognizing both as unfinished social projects requiring

continuous reflection and, inasmuch as they closed themselves to self-criticism, critique. Similarly, in his own political sympathies, Merleau-Ponty kept his distance from any particular cause or political party. Although he moved from hesitant support for European communism to provisional support for the parliamentary left, he judged the French political system to be anachronistic and its elite bankrupt, especially as its enduring colonial ambitions were exemplified by the war in Algeria.

551

Methodology of Political Thought

It is hard to draw a clear demarcation between *political thought* and *political ideology*, *philosophy*, or *theory*, all familiar concepts from practical politics as well as the academy. Thus, the meaning of political thought has never been unequivocal, a fact that must be reflected in any assessment of its methodology. The issues that have arisen during the history of political thought can have their origin in academic debates, but just as often they have been initiated by real-life political events. Therefore, the methods of political thought should acknowledge the diversity of the subject matter, for it may be of consequence whether a text was first intended to be a philosophical treatise on politics, a pamphlet addressed to masses, or advice to a prince.

The word *methodology* is equally challenging in this context. Rather than giving a commonly agreed-to list of methods for solving the problems of political thought (for it hardly exists), this entry addresses different ways of approaching the subject area and getting a grasp of its problems. The degree of their fruitfulness is subject to individual preference as much as it is a product of cultural and historical circumstance. Where this variance has led to methodological disagreement, it should be understood as a reflection of what is genuinely “political” in political thought.

Methodology and the Emergence of Modern Political Theory

Political theory as a part of political science was established in European and American universities by the late nineteenth century. Despite substantial national variation, the disciplinary evolution of political science highlighted the need to study what today could be called the methodology of political thought.

During the establishment of modern political theory, the study of central political concepts and principles was usually understood as a continuation of the Western tradition of moral and political philosophy that dated back to classical antiquity. Within the tradition, the terms *philosophical* and *scientific* were generally interchangeable, especially before the social sciences separated from philosophy. The methods of political philosophy were influenced by other branches of philosophy/science, as exemplified by the relation between St. Augustine's theological philosophy and politics or Thomas Hobbes's political philosophy and contemporaneous geometry. In the area of politics, the philosophical/scientific canon consisted of texts written both by nonacademic observers and participants, such as Niccolò Machiavelli and John Locke, and professional philosophers, such as Immanuel Kant and Georg Wilhelm Friedrich Hegel. The philosophers and social scientists of the nineteenth century often portrayed their own contributions as improvements or corrections of these earlier doctrines.

During the nineteenth century, political thought became closely associated with political ideology. This was connected to the birth of the immensely influential notion of modern mass politics, which presented the ideologies of the left and right as the organizing forces of politics. Thinkers such as John Stuart Mill and Karl Marx enjoyed a prominent role as individuals who could establish or demolish political principles (such as liberty or equality) with their capacity for theoretical (i.e., philosophical/scientific) reasoning. Political parties that associated with ideological "isms" were responsible for putting the principles into practice in parliamentary and sometimes revolutionary politics.

Finally, the nineteenth century produced important contributions to the theory of historical interpretation. These include the German hermeneutical tradition that started in the early nineteenth century with historical-critical interpretation of the Holy Scriptures, and the later controversies between scientific/philosophical and humanistic/historical studies of politics that were characteristic of many countries. The canons and traditions on which the study of political ideas was built became subject to increasing self-scrutiny, which is easily understood against the need of the relevant disciplines to understand why they had taken their particular shapes.

The Demand for Methodology

As long as the methodology of political thought has been debated, the issues have always been connected to the uses that are attributed to political thought. Thus, it is asked what the present students of political thought should *do* with ideas that were usually designed for some normative purpose and may continue to contain such relevance. We may, for example, examine political philosophy to locate its most rational and beneficial inventions and to educate future generations to implement them. Or we may be searching for a more cynical message that we suppose is written in between the lines to reveal the actual motives of individuals and states. Or we might want to develop a critical self-awareness toward the constantly evolving arsenal of ideas itself to understand better the preconditions of political debate. Or perhaps we are just pursuing the facts of a given historical event. All these options point toward different methodological choices and “styles” of studying political thought.

Throughout the history of modern political science, a major motive for the study of political thought has been to use it in the construction of institutions, communities, or attitudes. The history of political thought is closely connected to legal and constitutional thought, which helps explain its relevance in state- and nation-building. It has often been consulted about constitutionalism, parliamentarianism, or the allocation of political rights and responsibilities. This was the case especially during the period of democratic nation-building and social reform in Europe during the nineteenth and early twentieth centuries, as well as with their contemporary

American “Ideas and Institutions” school that combined studies into the history of political thought with moral education.

Universal Principles Versus Evolutionary Knowledge

The methodology of the aforementioned studies is often openly present-oriented, for they take all political thought as material that speaks *pro et contra* present-day political solutions. Indeed, it has been argued that this method was for a long time the principal one for using past political ideas. According to the German conceptual historian Reinhart Koselleck, all historical periods were perceived as qualitatively similar until about the late eighteenth century, which made it permanently legitimate to address contemporary problems with solutions that were first proposed by thinkers of another period, often the venerable Greco-Roman era of classical antiquity.

The methods of historical sociology, as developed by German scholars such as Max Weber around the turn of the twentieth century, suggested a much different historical experience. They argued that modern European societies were particularistic, and that their uniqueness, as well as that of any other culture, could be explained only by studying the long evolution of their economic, political, and religious ideas and institutions. Simultaneously, the influence of such groundbreaking figures as Charles Darwin and Friedrich Nietzsche led many to doubt whether the presumably general principles of politics could withstand the test of time even nearly to the degree of the principles of engineering and physics—with even these being questioned after the predictive power of the general theory of relativity had been demonstrated.

The new problems were echoed in new evolutionary (sometimes pessimistic) philosophies of history and, regarding the methodology of the history of ideas, in the “logic of question and answer” developed by the British idealist philosopher R. G. Collingwood during the 1930s. Advancing arguably one of the most influential methodological ideas in the field, Collingwood stated that there are no perennial problems in philosophy

but only individual answers to individual questions. Therefore, even the problems that were labeled by philosophers as “fundamental” or “eternal” were no less subject to historical change than the various answers given to them at different times. Thus, the historian of ideas was required to ask, often against the weight of accepted interpretations, what the historically unique problem was that an idea was initially designed to answer.

This argument helps explain why the methodological problems encountered in political thought often take the shape of *anachronism*: Either one supposes that past thinkers meant something that they historically could not have meant or one approaches a present problem with a solution that is no longer applicable. The provocative conclusion drawn later by the British historian of political thought Quentin Skinner was that, as we live in a fundamentally changing world, every generation has to do their own political thinking for themselves, and that there can be no predescribed authoritative method of doing political philosophy or normative politics in general. To demand from the history of thought a solution to our immediate problems represents weak thinking or, worse, intent to mislead by false authority.

The Decline of the Philosophical Method

The traditional philosophical-historical approach suffered a further blow after World War II when political philosophy was associated with totalitarianism. Karl Popper became famous for his “personal war effort” in equating the ideologies of communism and National Socialism with the philosophies of Plato, Jean-Jacques Rousseau, Hegel, and Marx in *The Open Society and Its Enemies* (1945). Even if his conclusions were not always endorsed for their historical accuracy, general pessimism prevailed about the state of the discipline. In 1956, the Cambridge historian Peter Laslett announced his famous diagnosis of the at least momentary death of political philosophy, and in his 1959 book *What Is Political Philosophy?*, the Chicago political philosopher Leo Strauss stated that his subject had reached a state of decay and perhaps putrefaction.

Despite the similarity of wording, Laslett and Strauss were not confronting the same issues. Laslett concluded that recent developments in

epistemology and linguistic philosophy had made the traditional study of the “Great Books” an intellectual dead-end. Strauss, a German Jewish émigré who had worked in the United States since 1938, praised the “Great Books” for their permanent wisdom, but he feared that their message would be ignored in modern universities where the new “positivist” social sciences reigned, and political philosophy was studied merely for historical interest.

Contemporary Approaches to the Methodology of Political Thought

The crisis of political theorizing that coexisted with the postwar “end of ideology” took different shapes in different schools of thought. So did its solutions, which still have their effect on the work of political theorists. The “death” of traditional political philosophy proved to be premature, as evidenced by the activity of authors such as Strauss himself, Hannah Arendt, Sheldon Wolin, Isaiah Berlin, and their numerous followers. John Rawls’s *A Theory of Justice* (1971) was celebrated as the rebirth of political philosophy more than any other single work. Its introduction of two general “principles of justice” and their extensive philosophical justification rejuvenated a method that was familiar from the classic social-contract theories, which Rawls sought to reestablish on a firmer basis. Additionally, his methods were significantly influenced by the social sciences, most notably, social-choice theory. Rawls’s normative liberalism has been criticized by, among others, Alasdair MacIntyre and Charles Taylor, who argue that the methods of its justification—such as the “original position” and the “veil of ignorance”—are so detached from real-life communities and practices that they are virtually unusable. Indeed, a generation later (*Political Liberalism*, 1991), Rawls himself backed off from his substantive claims as unworkable, defaulting to a procedural conception of liberalism. Since the early 1980s, the debate between rights-focused “liberals” and duties-oriented “communitarians” has constituted the mainstream of Anglo-American normative political theorizing.

The developments in Cambridge led to the emergence of a new historicism in the study of political thought. In his studies on Locke, Laslett demonstrated that the *Two Treatises* were much more a “party-political

pamphlet” than Locke’s intended contribution to political philosophy. In particular, he demonstrated to the satisfaction of most scholars that the famous second treatise was written in 1679, in the thick of plotting by Locke and his patron the Earl of Shaftesbury to overthrow the monarchy, rather than a decade later, as a justification of the new order established after the Glorious Revolution of 1688. Laslett’s students Skinner and John Pocock argued that the standard philosophical interpretations of other classical texts similarly misconstrued their historical identity. The character of political thinking as historically situated activity, and political thinkers as historically situated individuals, had also been misunderstood.

The method they proposed to address these problems was careful historical research into the linguistic and political context surrounding political thinkers. With an adequate understanding of the context, the Cambridge historians claimed, it is possible to reconstruct the historical range of possibilities confronted by a thinker, and even the intention behind her text. The historian of political thought, in other words, should find out what a historical actor was doing in writing that text—taking part in academic debate, suppressing a rebellion, or something entirely different. With just that question adequately answered, the worst anachronistic interpretations would be repudiated and new historical insights revealed. The “Cambridge school’s” emphasis on language was influenced by the philosopher Ludwig Wittgenstein’s later writings, according to which language and social action are interconnected like the two sides of a coin.

Skinner’s historical interpretations, especially during the 1960s, were situation specific and emphasized the immediate intellectual surroundings of a thinker at the expense of more extensive “social forces” or “traditions of thought.” They can be contrasted with other approaches that also have paid attention to “context” but have defined it differently. During the 1960s, C. B. MacPherson provided an example of a new Marxist reading of the history of ideas, according to which modern political thought as epitomized by Hobbes and Locke was a reflection and justification of the modern capitalist mode of production that emerged in England during the seventeenth and eighteenth centuries. If the economy was the chief context of explanation for MacPherson, later critical and postmodernist theorists have looked for further ways of theorizing the effects on political thought of

power relations embedded in gender, culture, race, identity, or language. Regarding current practices in the field, the ideas of Michel Foucault, condensed in the expressions “genealogy of power” and “archaeology of knowledge,” have been highly influential. Conceptual history (*Begriffsgeschichte*), originally a German project, focuses on the historical transformation of central political concepts and the “semantic fields” around them, and it has been pursued in many countries and language areas.

A lasting discussion on the methodology of political thought is whether the field of political thought is at all approachable by “method.” Many historically minded scholars have simply recommended careful research combined with common sense and historical imagination as the best methodological choice. Whether we agree or not, it may be admitted that what goes as a variety of methodologies of political thought may perhaps be better described as more or less coherent compilations of philosophical ideas and rules of thumb that guide interpretation. Arguably, such ideas well applied can provide consistency to a selected way of research; for example, Mark Bevir has pursued this line and recently proposed a comprehensive “logic” of the history of ideas to address the central problems of the field on a philosophically sound basis. In some cases, methods work simply as precautions against mistakes, such as unintended anachronism. Hardly anyone would discourage the use of method in this sense. Furthermore, it is a plausible claim that all students of political thought apply some methods and rules in their reasoning and in assessing the validity of interpretations. Another question entirely is how conscious they are of these methods with their possible advantages and limitations.

Michels, Robert

Michels, Robert

551

552

Michels, Robert

Robert Michels was born in Cologne on January 9, 1876, and died in Rome on May 2, 1936. Considered one of the most important social and political scientists of the nineteenth century, he still owes his fame to a single work, *Political Parties: A Sociological Study of the Oligarchic Tendencies of Modern Democracies*, which appeared in Germany in 1911 and which since then repeatedly has been published in the world's principal languages. His intellectual and political biography can be divided into five periods.

The first period stretches from 1876 to 1900. In these years, Michels lived in the gilded but severe world of his affluent bourgeois family, attending prestigious schools, taking up and then abandoning a military career, and carrying out university studies in Paris, Leipzig, Munich, and Halle.

Michels embraced socialism in 1900, breaking with his family and with his social background. This inaugurated the second part of his life, which lasted until 1907–08. In this period, he was active in European socialist parties across Germany, Italy, and France and, driven by a strong penchant for internationalism, came to approach progressively the tenets of revolutionary syndicalism. Furthermore, he cultivated an ever more intense scholarly vocation, establishing strong ties to Max Weber, Werner Sombart, and Gaetano Mosca. His faith in socialism barred him from embarking on an academic career in Germany, however, and he thus became an adjunct professor of political economy in Turin, Italy, in 1907.

He remained in Turin from 1907 to 1914. In this third period of his life, he abandoned political militancy in favor of research and university teaching. He thus distanced himself from his internationalism to join the causes of Italian nationalism and imperialism. And with the publication of the *Political Parties*, he became, alongside Mosca and Vilfredo Pareto, one of the principal theorists of elitism, leaving any democratic and socialist illusions behind. In 1913, finally, he applied for Italian citizenship, which he was granted only in 1921.

In 1913, Michels was called to Basel to take up a full professorship in political economy, and he remained there from 1914 to 1928. His pro-Italian position during World War I brought him to sever any links he still had with Germany. The Germanophile milieu in Basel also became openly hostile toward him. This hostility was further fueled by the sympathy that Michels began to foster for Italian fascism and for Mussolini. He was in personal contact with the latter already in 1923, trying also to legitimize the regime on the properly theoretical level.

Given this situation, Michels did everything he could to return to Italy and was finally called to teach at the University of Perugia in 1928. He spent the last period of his life teaching, researching, and, above all, propagandizing for the fascist regime abroad.

Michels wrote a great number of books and articles, particularly on patriotism and nationalism, on the history of socialism and Marxism, on sexual morals, on Italian imperialism, on the history of economic thought, and on the history of Italy and of Italian fascism. Nonetheless, it was his masterwork—the *Political Parties*—which ratified his fame as a political and social scientist internationally.

With this book, Michels proposed to analyze the internal structure of modern political parties so as to elucidate the tendencies that alternatively render democracies possible or impossible to uphold, not only within parties but also more generally in any organized social and political group, from the smallest communities all the way up to the state. To reach general conclusions, Michels decided to emphasize the analysis of those parties that seemed sensitive to the values of democracy because he considered them to be naturally inclined to the development of genuine democratic practices in

their internal organization. He thus decided to focus on socialist parties, in particular, on the German Social Democratic Party, that is, to the parties of which for years he had been a militant member.

The results of his work were extremely important. With his book, Michels was effectively able to elaborate an original sociological and political theory of the party. Simultaneously, he formulated the celebrated “iron law of oligarchy”; that is, the theorem that states the intrinsic unrealizability of democracy and the eternal dominion of organized minorities. He also gave a convincing explanation to the grave crisis experienced by the socialist parties of the Second International.

Because of all these elements, *Political Parties* immediately enjoyed an extraordinary influence that was definitively consolidated between the 1940s and the 1960s. Michels has since then been considered a “classic” in the scientific study of political parties and in the theory of elites, an exemplary critic of modern democratic theories, and one of the most significant exponents of nineteenth-century political realism.

Mill, James

Mill, James

552

554

Mill, James

James Mill (1773–1836) was born in Scotland, educated for the Presbyterian ministry, lost his faith, moved to London, and became an eminent political theorist, psychologist, educationist, economist, historian, and legal, political, and penal reformer. Influential and controversial in his lifetime, Mill is now all but forgotten. He is today remembered mainly as the dour and demanding father and teacher of his more famous son, John Stuart Mill, and as Jeremy Bentham's ally and collaborator on projects of penal and political reform. The younger Mill went on to become an eminent theorist of liberty. Bentham was a wealthy and eccentric genius who was the preeminent theorist of utilitarianism.

Mill's range of interests was remarkably wide, extending from education and psychology in his two-volume *Analysis of the Phenomena of the Human Mind* (1829), to political economy in *Elements of Political Economy* (1826), to penology and prison reform, to the law and history, and, not least, to political theory. During his lifetime, he was best known as the author of *History of British India*, which appeared in six large volumes in 1817. His *History* was something of a sensation and secured for Mill and his large family a measure of financial independence that had previously been sorely lacking.

Mill's modern reputation as a political theorist rests almost entirely on a single essay. In *Government* (1820), Mill maintains that government is neither more nor less than a means to an end, namely, the happiness of the

whole community and of the individuals composing it. Mill's brief essay takes the form of a clipped, concise, logically deductive argument. That argument begins with the assumption that every human being is motivated exclusively by self-interest, and in particular by a single overriding interest—the desire to experience pleasure and to avoid pain (this is the fundamental axiom of utilitarianism). Pleasures and pains come either from nature or from our fellow human beings. Government is concerned directly with the second and indirectly with the first: “Its business is to increase to the utmost the pleasures, and diminish to the utmost the pains, which men derive from one another” (Mill 1991, 4). Yet “the primary cause of government” is to be found in nature itself since humans must wrest from nature “the scanty materials of happiness.” Nature and human nature combine to make government necessary. It is human nature not only to desire happiness but also to invest as little effort as possible in satisfying that desire. Labor being the means of obtaining happiness, and our own labor being painful to us, we will, if not prevented, live off the labor of others. To the degree that others enjoy the fruits of my labor, my primary incentive for working—namely my own happiness—is diminished if not destroyed.

Therefore, Mill continues, the primary problem in designing political institutions is to maximize the happiness of the community by minimizing the extent to which some of its members may encroach on, and enjoy, the fruits of other people's labor. This cannot happen, Mill maintains, in a monarchy (in which a single ruler exploits his subjects) or in an aristocracy (in which a ruling elite exploits everybody else). Nor can communal happiness be maximized in a direct democracy since the time and effort required for governing would be subtracted from that available for engaging in productive labor. The only system that serves as a means to the end of individual and communal happiness is representative democracy, in which citizens elect representatives to deliberate and legislate on their behalf and in their interest. The question quickly arises, however, as to how representatives can be made to rule on the people's behalf rather than on their own. Mill's answer is that frequent elections and short terms in office make it unlikely that elected representatives will legislate only for their own benefit. After all, representatives are drawn from the ranks of the people to which they can, after their term in office ends, expect to return. Given what

we might nowadays call the incentive structure of representative government, representatives have every reason to promote the people's interests instead of their own. Indeed, in a properly structured system, there will be an "identity of interests" between representatives and their constituents.

There are marked methodological affinities between Mill's deductive approach to political theorizing and modern rational choice theory. Both begin by assuming that human beings are by nature self-interested and that most if not all political behavior can be explained as attempts by political actors to promote their own interests.

Mill, John Stuart

Mill, John Stuart

554

559

Mill, John Stuart

John Stuart Mill (1806–73) changed the way in which the modern world views, and legal systems address, the issues of individual liberty of thought, expression, lifestyle, and action. His ideas remain both influential and controversial to this day.

Life

Mill was born in London as the oldest of nine children and had to endure a most unusual childhood. His father, James Mill, was a popularizer of the utilitarian philosophy of Jeremy Bentham, and it was for the promulgation of these views that John Stuart was trained. He was educated with an intensity that gave him, as he himself put it, a quarter of a century ascendancy over his contemporaries. This advantage was costly to Mill, for it involved a childhood without playthings, without holidays, and although he did have eight younger siblings—from whom he seems to have been distant—without the company of children of his own age. The last deprivation would have been impossible had he gone to school, but no school would have imposed the regime that his father desired, and so James Mill educated his son himself. Consequently, John Stuart commenced learning Greek at the age of three and Latin at the age of eight. Clearly, Mill's distance from the norms of his time was immense. In an age of widespread illiteracy, he was highly educated, just as in an age of widespread religious observance, he was thoroughly secular. At the age of

13, he was sent for a year to France with the family of Samuel Bentham, the brother of Jeremy. Here he enjoyed a more relaxed atmosphere than at home and, more significantly, commenced a lifelong path of sympathetic engagement with French thought, which later included correspondence with Alexis de Tocqueville and Auguste Comte.

In 1823, at the age of 17, Mill followed his father into the British East India Company, as he had earlier followed him into utilitarianism. He rose high in the company, attaining his father's previous position of Chief Examiner. As well as clearly satisfying his employers, Mill somehow found both the time and energy necessary for his various literary and political aspirations. During his 35 years with the East India Company, he engaged in numerous journalistic campaigns, was founder and editor of the *London and Westminster Review* (1836–40), and wrote two of the major textbooks of the century in their respective fields, *A System of Logic* (1843) and *The Principles of Political Economy* (1848).

After the 1857 Indian Mutiny, the British government felt it necessary to take India under direct state control. Mill led the opposition to this move, fearing that it would lead to policy on India determined by party political considerations. He refused the offer of a job on the new advisory council for India and, at the age of 52, accepted retirement. This decision was, however, far from the end of his working life, for he now published his most influential political writings, *On Liberty* (1859), *Utilitarianism* (1861), *Considerations on Representative Government* (1861), and *The Subjection of Women* (1869). He also became the Liberal Member of Parliament for Westminster between 1865 and 1868, where he is best remembered for proposing an amendment to the 1867 Reform Act that, had it been accepted, would have given votes to women.

Mill's personal life became more public than he would have liked. Harriet Taylor, who inclined toward feminism and socialism, was a married woman when she met Mill in 1830. She was nevertheless intellectually available, in that she had decided that her husband, the pharmacist John Taylor, was her mental inferior. She bore him two sons and a daughter, but he bored her. Mill did not, so Harriet and Mill became regular companions. Mill dined at the Taylor household once or twice a week. John Taylor was amazingly

tolerant of this development, but unsurprisingly, friends and acquaintances began to gossip. So it went on until 1849 when Taylor died. Two years later, Harriet and Mill married. Their time living together was all too brief; Harriet died of tuberculosis in Avignon, France, on November 3, 1858.

Early Thought

In his *Autobiography*, Mill acknowledged the influence on him of the socialistic Saint-Simonian school in France. He recalled being “greatly struck with the connected view which they for the first time presented to me, of the natural order of human progress; and especially with their division of all history into organic periods and critical periods” (Mill 1981, vol. xxiii, 171). This classification is evident in Mill’s first major journalism, his five articles on “The Spirit of the Age” that appeared in *The Examiner* in 1831. Their main theme was that society was suffering the disabilities of a transitional state. The old ideas no longer carried conviction. The constituted authorities no longer commanded respect. Power was held by those unfit to exercise it. Authority and ability no longer coincided. Old institutions and doctrines had fallen into well-deserved disgrace. Society had to change so that expertise was elevated to the superior position that its merits deserved.

In 1823, Mill had formed the Utilitarian Society and yet soon thereafter became ambivalent about his intellectual heritage. His famous mental crisis of 1826–27 may be seen as a process that led to him gaining a broader philosophical outlook. He dared not openly criticize Bentham while James Mill was still alive, but in 1833, he wrote an anonymous appendix to E. Lytton Bulwer’s *England and the English*. Here he stated that Bentham was not a profound analyst of human nature, had too little knowledge of other people’s writings, omitted the importance of conscience, and overstated selfish motives.

In 1836, James Mill died. His son was now free to say openly what he thought, and in 1838 and 1840, he published what may be regarded as companion pieces on “Bentham” and “Coleridge.” For Mill, Bentham and Samuel Taylor Coleridge represented polar opposites; one was a representative of the eighteenth-century Enlightenment, and the other of the

reaction against it. They were the two great English minds of their age. Although Bentham is acknowledged as a great thinker, what is more striking is the extent to which Mill bit the hand that had fed him. He noted that Bentham had no interest in other thinkers, a limited notion of human nature, no sense of the importance of honor and duty, and nothing to say on how humankind might improve itself. Equally striking, but even more upsetting for his radical friends, was Mill's appreciation of Coleridge. Mill presented the mentality of the Enlightenment as one-sided, good for demolition, and imaginative in its models for society, but neglectful of the factors that held society together. Mill clearly appreciated Coleridge's idea of a clerisy, especially on the understanding that it need not necessarily be a religious organization.

Mill's *A System of Logic* went into eight editions, including, surprisingly, a cheap edition for the working classes. Its main concern was to refute the intuitionist philosophy that downplayed, or even denied, the role of experience in discovering truths and was, Mill thought, the basis of conservative attitudes. He also wanted to refute the determinism of the Owenites and assert the existence of free will. There was a personal motive behind this intent in that Mill had been described by critics as a "manufactured man." After his mental crisis, he felt that he had been able to develop beyond the conditioning of his childhood. It was all a matter of determination. People could make or reform their own character if they truly had the will to do so. This freedom of the individual also applied to social classes and societies; they could all improve and escape from their limitations and backwardness if they chose to do so. This apparent distinctiveness of human agents sits uneasily with Mill's simultaneous assertion that the method of the social and the physical sciences was one and the same.

In terms of political theory, the book's most interesting sections deal with the nature of the social sciences and historical change. In this area, one of the main influences was Auguste Comte, with whom Mill had an intense but fairly brief correspondence in the 1840s. Mill fell out with Comte over the latter's views on female inferiority and described his system as "liberticide" (Mill 1972, vol. xiv, 294); yet he remained impressed with his delineation of humanity advancing through theological, metaphysical, and

positivist stages. Mill was concerned with many of the same intellectual problems as Comte. For example, he believed that the basic issue in the social sciences was to uncover the law by which one type of society produces its successor. In Mill's view, the basic cause of social development was intellectual: Advances of knowledge led to all other kinds of progress. This concern clearly links Mill not only with Comte, but also with three other founders of sociology, Alexis de Tocqueville, Karl Marx, and Émile Durkheim. Like both Comte and Marx, Mill looked for two kinds of empirical laws of society, exactly similar to what Comte called social statics and social dynamics. Unlike them, however, he was no determinist; the future held out possibilities rather than certainties.

Mill's *Principles of Political Economy* was one of the basic economic textbooks of its century, with seven editions published between 1848 and Mill's death in 1873. For Mill, a competitive market economy leads to the most efficient use of resources, so he wanted the market principle extended into all areas where it might bring benefit. In its contemporary context, this belief had an anti-aristocratic thrust, for legal patterns stemming from feudal roots still protected some landed estates from the full force of the market economy. Mill instanced the existence in law of entails, by which inheritance was predetermined. The result was that an heir assured of his inheritance was likely to grow up lazy. Land was most likely to be used productively when it was an object of commerce. In Mill's view, competition cheapened the product and was a stimulus to progress. In contrast, those protected against competition were likely to become idle and unintelligent.

Competition, then, has a salutary influence on people's morality. Where, however, Mill asked, was the competitive society going? Could it progress indefinitely? Mill had learned from David Ricardo that the return on capital tends to diminish and so economic development could not continue indefinitely. For Adam Smith and Ricardo, this conclusion was disturbing. For Mill, on the contrary, the stationary state was to be welcomed. Competition was not to be all and end all of life, nor was the pursuit of material success. The virtues of the market society were now becoming overwhelmed by their attendant vices. Material progress had its vital part to play in bringing backward societies into the modern age but should not be

mistaken for progress as such. With the problem of productivity solved and with the economy stationary, there would still be as much scope as ever for moral and intellectual progress.

So the market economy could safely be left to run its downward course, although any departure from it, through state intervention, was permissible only if clearly for the general good. Mill was in principle suspicious of the state, which already had too much power and too extensive an influence. Officials, even of a democratic state, could be just as tyrannical as those of a despotic one. Mill thought that people understood their own business better than the government could, and that most things are done worse by government than they would be by the individuals most concerned with the matter. Furthermore, and crucially, the greater the government activity, the less scope remains for individual exertion and self-improvement. Such individual activity should have both proper scope and its own reward. Mill, consequently, opposed a progressive income tax, which he thought would merely impose a penalty on those who had worked harder or saved more diligently than others.

Although Mill clearly wanted to hold the state at bay, he found that principle continually retreated before expediency. The areas of legitimate state action seemed to grow, while his empirical examples of improper interference remained few. Mill was suspicious of the state but committed to personal self-development and found that the latter came to require the former, for individual prosperity required an infrastructure of, at least, law and order, a currency, standard weights and measures, as well as roads and canals. It was necessary that education be made compulsory, children be safeguarded, and the mentally ill be cared for. Also, infant industries might need protection. The functions of the state, then, are either prohibitive or facilitative. The boundary of its activities could not be determined by a principle about its own intrinsic scope but by whether it augments or retards personal development. In this way, Mill started along the path that, later in the century, led to the “New Liberalism” of Thomas Hill Green, J. A. Hobson, Leonard Hobhouse, and Herbert Croly. On the insistence of his wife, Mill included a chapter in *Political Economy* called “On the Probable Futurity of the Labouring Classes.” It needs saying that the socialism with which he came to sympathize was not that of the twentieth-century

centralized state, but of small, relatively egalitarian communities of voluntary participants. He gave further consideration to these ideas in his “Chapters on Socialism,” written in 1869 but not published until 1879, six years after his death.

On Liberty

Mill’s most enduring work is *On Liberty*, whose main theme concerns the threat to individuality in the age of mass society. In terms of individuality, Mill was concerned with the problem of when society could rightly interfere with the individual. This question led him to draw a distinction between two kinds of action: self-regarding and other-regarding. Only in the latter case had society a right to interfere with individual actions. Contemporary and later critics have found it hard to draw a clear dividing line between these two kinds of action. For example, as Mill realized, taking drugs might seem like a self-regarding action, but it can lead to personal disablement that has the other-regarding consequences of family stress and strains and costs on the welfare services. What remains significant is Mill’s pioneering attempt to establish proper limits to social and political interference.

Mill not only defined liberty negatively as consisting in the absence of outside pressures, but also he added a positive side. This consisted of liberty as the free exercise of rationality. This need, he said, was a human requirement. Rationality, however, was not equally attainable by everyone. Some people are not yet fit for liberty. In his *Autobiography*, Mill asserted that representative democracy was not an absolute principle. Its application was a matter of time, place, and circumstances. Mill, then, may be described as a developmental liberal in that peoples qualify for the liberal rights and freedoms only when they attain a fairly high level of general development. In the first chapter of *On Liberty*, he explicitly left out of account backward societies still at early stages of development.

Mill is perhaps most widely known for his argument on freedom of thought. His striking basic statement on this is the following:

If all mankind minus one, were of one opinion, and only one person of the contrary opinion, mankind would be no more justified in silencing that one person, than he, if he had the power, would be justified in silencing mankind (as quoted in S. Collini 1989, 20).

Mill then provided a number of justifications, of varying plausibility, for his position: that to silence an opinion is to rob the human race; that the opinion we wish to suppress might actually be right; that even false opinions have a positive function in forcing people to defend their beliefs; and that we can never be fully certain that the opinions we wish to suppress are false and ours are valid. Finally, Mill made a partial withdrawal. He now considered the possible social consequences of free speech and decided that in some cases law and order had priority. Opinions, then, should still be free, but their expression should be limited if they were likely to have sufficiently detrimental consequences in practice.

In 1835 and 1840, Mill had reviewed the two volumes of Tocqueville's *Democracy in America* and thereby did much to make the work known and appreciated in Britain. Mill himself was much influenced by Tocqueville's analysis of mass society. This was a condition in which the old social gradations were breaking down. Individuals were no longer members of a particular class or group but of society in general. An atomized society was emerging in which individuals became lost in the crowd. Mediocrity was becoming the dominant power. Some commentators have seen this concern as an opposition to rising working-class influence. Mill certainly did not want the uneducated to have equal voting rights, but here he was explicit regarding to whom he was referring. In England, public opinion was that of the middle class and in America that of the white population. Either way it was a collective, mediocre mass. Liberty's old enemies were located at the apex of society: kings, governments, and churches. The new enemy was in the middle of the social pyramid. This change of opponent could lead to liberty's defenders being caught off their guard by the change of direction from which the current danger came. Mill thought the threat mattered for two reasons. First, liberty was a requirement of human nature. He described human nature as like a tree whose basic forces require it to grow. Second, liberty was the basic prerequisite for social development. In Mill's view,

everything that had elevated European societies above the barbarians was a consequence of allowing freedom of opinion. A threat to this was a threat to European civilization itself. Europe's progress, then, derived from its diversity but was now endangered. Mill reminded his readership of the fate of China. Here was an ancient civilization that had at one time achieved considerable progress, but it had ossified at the point when freedom was curtailed. China, then, had become a backwater; world development had passed it by. For Mill, this analysis was the prelude to a call for action. Individuals should fight back against the pressures to conformity. Even eccentricity, every refusal to bend the knee, was a service in the battle against the stifling pressures of mass society.

Later Writings

An application of some of Mill's ideas on freedom to one specific problem is his *The Subjection of Women*, a bold work given the prevailing climate of opinion, and one that exposed him to considerable ridicule. It was also his only book that lost money for the original publisher, although it later became accepted as a feminist classic. Mill believed that after food and clothing, freedom was our strongest need. Freedom, however, was denied to half the species, to women. Mill instanced the situation where in Britain the children and property of a marriage legally belonged to the husband and noted that women had only limited access to higher education. They also had no vote, for Mill had failed in his attempt to amend the 1867 Second Reform Bill so as to grant them the vote on the same terms as men. In the decade when slavery had been abolished in the United States, Mill declared that a wife was a slave in the fullest sense of the word.

In Mill's view, the inferior status of women had originated in conquest. It was the sole surviving legacy of the anachronistic law of the strongest. Women's inferior legal status, then, was a consequence of their lesser physical stature, for when law first emerged, it had sanctioned prevailing relationships. This era, of course, was such a long time ago that women's lower status had come to seem natural, often even to women themselves. But, argued Mill, "What is now called the nature of women is an eminently artificial thing" (as quoted in S. Collini 1989, 138). Mill's basic position was that, unlike what had happened previously, the relationship between the

sexes should be based on complete equality. He also hinted at the importance of feminism for the solution of the Malthusian problem.

In his essay “Utilitarianism,” Mill attempted to meet the criticism that the doctrine was a hedonistic one worthy only of swine. On sheer quantities of pleasure, it might appear that a pig, well fed and lacking ethical qualms, would score higher than Socrates on the felicific calculus. This conclusion would be a humiliating moment for Western philosophy. Mill rescued Socrates on the basis that his pleasures, although less clearly apparent than those of the swine, are nevertheless of a higher qualitative order and that this elevation gives them a greater weighting. Mill’s positing, then, of a quality axis in addition to the quantity one represents a significant break from, and complication of, Bentham’s egalitarian formulation that each person is the best judge of his or her own happiness; in other words, the source of pleasure is irrelevant in terms of its value.

The designation of utilitarianism as a doctrine worthy only of swine, attributed to Thomas Carlyle, relates to the obvious selfishness of pursuing solely one’s own happiness. Where does this criticism leave Bentham’s pursuit of the greatest happiness of the greatest number? It would seem that here we have two different and potentially contrasting motivations. Mill sought to resolve them by saying that as between the two aims, one should judge in an impartial way. This view, of course, clashes with a basic tenet of natural justice: that one cannot be a neutral judge in one’s own case. So, on some accounts, Mill’s attempts to rescue utilitarianism from obvious objections merely landed it in still greater difficulties.

In *Considerations on Representative Government*, Mill applied some of his earlier concerns to an increasingly democratic political system. Thus, he advocated proportional representation as a means of protecting minority opinions, and in order to defend quality against quantity, he argued that the franchise should not extend to the illiterate, to those receiving welfare, or to nontaxpayers. In pursuit of the liberal ideal of equal opportunities, he also called for competitive entry into the Civil Service, a reform introduced ten years later.

Mill is now widely regarded as the greatest nineteenth-century liberal thinker. During his lifetime, however, there was more respect for his

intellect than for his opinions. In a number of ways, he seemed dangerously radical. For example, he made scathing comments about the aristocracy, approved of the French revolutions of 1830 and 1848, had no obvious religious beliefs, and sympathized with the grievances of the Irish, with the North in the U.S. Civil War, and with socialistic experiments. He also had what seemed at the time to be ridiculous and dangerous views on sexual equality. In some ways, Mill was, as he himself believed, ahead of his time. What remains most valued and timely today is his defense of individuality and free speech. Perhaps no thinker has more influenced modern systems of law in specifying the limits of the government's proper powers over individuals. Mill's most obvious sectarian influence is the various libertarian movements and political parties around the world, especially in the United States. More generally, the essence of liberalism is the right to be different in nonharmful ways, and that right is the core of what Mill was trying to defend.

Modernism

Modernism

559

560

Modernism

Modernism refers to the artistic practices of Enlightenment modernity in crisis. Those practices sought to bear the burden of political failure by simultaneously interrogating and seeking to twist free of the premises of enlightened rationalism that had proved not only incapable of realization but also were perceived to be wrong in themselves. Central among the recurring motifs of modernism's critical practice is the repudiation of the idea that social practices can be grounded on unchanging and rationally secured foundations; this entails the embrace of contingency over eternity, particularity over universality, the new over the old, process over product, and a demand for experimentation without end.

If, since Friedrich Schiller, artistic modernism has been the stand-in for an absent politics, political modernism is the refashioning of politics itself under the sign of modernist self-consciousness. Although elements of a political modernism are widely scattered, it is in the political thought of Hannah Arendt and Jacques Rancière that it has achieved perspicuous presentation.

For both Arendt and Rancière, political philosophy has been throughout its history the repudiation of politics by making political action into an instrument for achieving ends external to political action itself. Philosophy begins with the denial of the autonomy of politics: According to Arendt, it was Plato's horror and grief over Athens's treatment of Socrates that led him to subsume politics under philosophy, making the idea of a

homogeneous and stable social order the truth of politics. Even Karl Marx, Rancière argues, understands political antagonism as a displaced manifestation of the true socioeconomic antagonism between classes, entailing that politics can exist only with the promise of abolishing itself.

Arendt's first modernist gesture is to argue that the domain of politics does not concern rational truth but opinion. Opinions matter because the world appears to each individual differently; the objectivity of the appearing world is not a truth beyond it but solely the acknowledgment that the same world is available from different perspectives, and it is through multiplying and evaluating perspectives that social meaning evolves. Because no one can know another's perspectival opinion before having it presented, then in politics, differences matter; politics is the domain of pluralism and difference, not of identity and sameness.

For Rancière, social order—what he calls “the police order”—is the normatively saturated appearing of a social world from the perspective of a dominant class. Political action is speaking and acting that contests a given police order; political action occurs by a theatrical multiplying of perspectives, creating a dissensus over how the world appears, revealing previously excluded concerns and interests in a manner that makes their earlier exclusion appear as “wrong.” Since each new social order is a police order, then politics is the endless attempt to equalize the unequal.

For Arendt, because politics occurs through the revealing of the world from different perspectives, the primary mode of politics is speaking and acting together. Because the meaning of our life together beyond the pragmatic requirements of social reproduction—beyond the requirements of “labor” and “work” in Arendt's lexicon—is given through how we understand our life together, then life becomes meaningful only through political action. Political action gives to labor and work their human meaning through creating the terms of our being together—what Arendt calls “power.”

In laboring, we repeat those doings necessary for our survival as natural beings; in work, we bring into being artifacts whose originals exist as independent ideas; only in action do we begin something new. For Arendt, each action is a new beginning, a new way of connecting and bonding us one to another. Arendt labels the human capacity for new beginnings

“natality.” Natality is constitutive of the human condition; the human condition is human life as conditioned, as subject to conditions that may change or disappear altogether.

Unsurprisingly, in light of these claims, Arendt, belatedly, came to regard first revolution, as exemplified by the American Revolution, and then civil disobedience as the paradigms of political action. Civil disobedience reveals that the truth of revolutionary founding is necessarily a re-founding. If action is essentially beginning, and beginning best exemplified by revolutionary founding, then the truth of founding must be re-founding, beginning again.

Modernism is the self-consciousness of modernity; in German, modernity is *Neuzeit*, new time. Political modernism is the transformation of this new understanding of social and historical time into an idea of political action in which the meaning of the human is an ongoing experiment, requiring continual renewal.

Modernization

Modernization

560

561

Modernization

Modernization is a process of political, social, economic, and cultural change as countries move toward more differentiated and complex forms of social and political organization. The main theoretical contribution to the study of modernization has been that of American postwar sociological theories. These theories are typically developed around the implicit or explicit dichotomy between two ideal types: “modern” societies, which are depicted as urban, developed, or industrialized, and “traditional” societies, which are usually portrayed as rural, backward, or underdeveloped. An evolutionary process that follows certain laws or, at least, discernible general patterns of development connects these two types of social structure. The underlying assumption of the postwar modernization theories is that all societies follow a similar historical course of development, eventually leading to increasing differentiation and complexity. Some theories, such as that of Talcott Parsons, emphasize the role of endogenous factors in the process of modernization, while others focus on the diffusion of exogenous factors such as values, technology, and forms of social and political organization. In both cases, the aim is to identify the main social and economic variables and institutional mechanisms responsible for the process of modernization of Western countries to transfer this knowledge to developing nations.

These theories of modernization came under close scrutiny in the 1970s. Three main criticisms can be identified. First, the premise that there is a universal original situation (that of underdevelopment), from which all

countries begin their evolutionary path to modernity, has been criticized on both historical and analytical grounds. Second, the prescriptive character that often accompanies modernization analyses is increasingly rejected by developing countries on the grounds of paternalism or external interference. Postcolonial approaches and subaltern studies have been pivotal in the articulation of this sort of criticism. Third, and more importantly, there is a growing dissatisfaction with the premise shared by most modernization theories that, despite some historical differences, present-day developing countries are bound to modernize through the same stages and processes as developed countries went through before.

This particular criticism has led to the development of the main theoretical alternative to postwar modernization theories, S. N. Eisenstadt's paradigm of "multiple modernities." As a macro-sociological theory, Eisenstadt's approach to the comparative study of civilizations represents an alternative to the postwar modernization theories. Eisenstadt began his career as a follower of Parsons, but in the course of the 1960s, he grew increasingly critical of Parsons's evolutionism, turning instead to Max Weber as his main source of inspiration. Eisenstadt's notion of multiple modernities rejects not only the Parsonian theories of modernization and of convergence of industrial societies, but also the classical sociological analysis of Karl Marx, Émile Durkheim, and even Weber. Eisenstadt's point is that reality proved Parsons's evolutionism wrong. Instead of the expected convergence of individual societies toward a common model of "modern society," with the United States playing the self-reassuring role of the "pioneer," actual developments around the globe indicate that different societies have modernized along different lines of institutional development. Although all societies are becoming "modern," the precise meaning of "modern" and its institutional expressions vary enormously.

Eisenstadt's macro-sociological theory of comparative civilizations identifies five major factors shaping the institutional contours of the "multiple modernities" (Eisenstadt 2006, 207–08). First, the contours of modernities have been changing as a result of the internal dynamics of the various institutional arenas (political, economic, technological, etc.) of each society. Second, modernities have been shaped by the political struggles between different states. Third, the shifting hegemonies in different

international systems have also contributed to shaping the institutional contours of modernities. Fourth, the confrontation between modernity and non-Western civilizations (such as the Islamic or the Japanese) is yet another relevant shaping factor. Fifth, the confrontations resulting from the promises of modernity (e.g., political liberal democracy) and its actual concretizations (e.g., liberal democracy as the political regime of only a few developed countries) activate the consciousness of the contradictions inherent in the cultural program of modernity. According to this perspective, the empirical study of processes of political modernization involves a threefold schema composed of key social groups' motivations and actions, cultural visions (ideological, religious, etc.), and institutional patterns, such as constitutional arrangements.

563

Montesquieu, Baron de

Charles-Louis de Secondat, Baron de La Brède et de Montesquieu (1689–1755), stands as one of the most acclaimed writers of the French Enlightenment. Yet along with this renown, there remains a great deal about his work that is enigmatic, as a result of the broad reach of his intellectual ambitions, the breadth of his research, and a writing style that aims to provoke reflection rather than provide exhaustive analysis. Although born into a minor family of the *noblesse d'épée* (the traditional or old nobility), Montesquieu is sometimes regarded as providing an intellectual defense of the class of *noblesse de robe* (those made noble by holding certain official charges) whose ambitions were tied to the institutional fortunes of the regional courts in old regime France, the *parlements*.

Early Life and Career

Montesquieu was born in the Chateau of La Brède, some 25 km outside the city of Bordeaux, in early 1689. He was schooled by fathers of the Congregation of the Oratory at the college of Juilly (in French and Latin). From 1705 until 1713, he studied law at the University of Bordeaux and at the law courts in Paris, the latter under the tutelage of Nicolas Desmolets, who encouraged Montesquieu at the same time to explore his broader intellectual interests. On returning to La Brède, he took on seigniorial duties and the position of *président à mortier* (principal magistrate) of the *parlement* of Bordeaux, an office inherited from his uncle.

His career in the law courts in Bordeaux (1714–26) offered him practical insight into the broader institutional dynamic of old regime France and into ways in which the commitments and principles of monarchy played out among the various claims of regional, institutional, and social corps. Although he came to acknowledge that the practice of law was not his vocation, the study of law was a lifelong passion, and he retained his title of *Président* even after ultimately selling his claims to the office.

While serving as a magistrate, Montesquieu pursued some of his broader intellectual interests through participation in the activities of the Académie of Bordeaux. His early writings of this period, though, were far surpassed with the publication of his best seller, *Lettres persanes* (1721).

Lettres persanes and L'Esprit des lois

Through the letters of Usbek, a Persian domestic despot, and his companion Rica, written to a number of friends in Ispahan while they traveled to and around Europe, Montesquieu offers a literary structure that satirically reframes French social and political mores. By playfully mocking key sources of authority and tradition in French life, Montesquieu both touched on and fuelled a growing tendency of critical reflection within the circles of the burgeoning public sphere.

Spurred on by his literary success, Montesquieu expanded his networks into prominent circles of Parisian literary and social exchange, and he was led to seek further enlightenment, abandoning his judicial career and traveling around Europe for three years, including a longer stay in England, where he was to attend sessions of the British Parliament and meet a number of British public figures. The visit to England was formative in his intellectual development, leading him to reflect on the possibility of a new type of hybrid regime that combined features of monarchy and republicanism and that implicated a new understanding of public sentiment shaped by the pervasiveness of commerce and the dominant rhetoric of self-interest.

On his return from his travels, he began a more serious life of study and in 1734 published his *Considérations sur les causes de la grandeur des Romains et de leur decadence*. Although sometimes regarded as a thinly

veiled indictment of Louis XIV's policies of protracted war and expansionism, this piece is also not without merit in Montesquieu's own intellectual development, being the first piece where he invokes in a serious way the notion of *l'esprit général* or the idea that a number of social and cultural factors contribute to a moral climate that both shapes and limits what is possible in the political sphere. Still, this work and most of what followed it into the 1740s is generally considered as a prelude to his most important work, *L'Esprit des lois*, published in 1748.

L'Esprit des lois seeks to articulate a general theory that can account for the diversity of human laws that exist as well as provide some basis for adjudicating the appropriateness of those laws. Along with a general theory of causes that draws from a wide variety of factors including geography, climate, commerce, religion, diverse sociological factors, and gender roles and that provides an explanatory framework for a number of legal particularities, Montesquieu structures his broad analysis of the differences that exist among states on the ideas of the nature and principle of regimes. The *nature* of a regime refers to the general institutional structure by which power is distributed, and the *principle*, perhaps the greatest theoretical innovation offered by Montesquieu, refers to the quality and intensity of sentiment shared by leaders and the public and that plays a role in legitimizing, motivating, and setting limits to the use of political power.

This work was celebrated across Europe, although not without concern from the church censors. His remaining work until his death in 1755 was largely spent defending the orthodoxy of his claims.

Morris, William

Morris, William

563

565

Morris, William

William Morris (1834–96), poet, artist, essayist, socialist, designer, translator, tapestry maker, pioneer of book design, and radical ecologist, has influenced the development of nonparliamentary socialist thought for more than 120 years. An unwavering believer in simplicity of life, abolition of “masters,” and shared possession of (and responsibility for) all the means of production, Morris argued tirelessly that artistic endeavors of all sorts—but especially “the lesser arts”—were ethical tests and measures of the value of such production. Animated by these ideals, he also strove to act on his other lifelong conviction: that reliance on half-measures and parliamentary maneuvers undermined socialist ideals of “fellowship” and fetishized political power as a form of property and a corrupt (and corrupting) end in itself.

By way of avocation—so to speak—Morris was also one of the nineteenth-century’s most active architectural and artistic preservationists. An agnostic haunted by the unsung accomplishments of anonymous artists and artisans, in 1877, he founded the Society for the Protection of Ancient Buildings (“Anti-Scrape”), which saved hundreds of churches and other ancient architectural creations from demolition under the guise of “restoration.”

Born March 24, 1834, in Walthamstow, Morris was the third child and eldest son of Emma Shelton and William Morris Sr., a London banker and mine-owner who died when Morris was 14. Morris studied at Marlborough College (1848–51) and Exeter College, Oxford (1853–56), and briefly

apprenticed in the office of the Gothic revival architect G. B. Street before he married Jane Burden, an Oxford stableman's daughter, in 1859. In 1861, he and several close friends formed the design and decorating firm of Morris, Marshall, Faulkner and Co. (later Morris and Co.), but he also devoted many of his apparently boundless energies from 1856 to 1877 to art and literature.

As a student, for example, he edited and wrote for the short-lived *Oxford and Cambridge Magazine* (1856). As an artist, he illuminated more than 200 book manuscripts and designed hundreds of images and patterns for stained glass, textiles, and wallpapers for the firm. And as a translator, he prepared renderings of Old Norse texts such as *The Story of Grettir the Strong* (1869), the *Völsunga Saga* (1870), and *The Saga Library* (1891–96) in collaboration with the Icelandic scholar Eiríkur Magnússon. As a gifted and prolific poet, finally, Morris wrote and published *The Defence of Guenevere* (1858), *The Life and Death of Jason* (1867), *The Earthly Paradise* (1868–70), *Love Is Enough* (1873), *Sigurd the Volsung* (1876), and *Poems by the Way* (1891). Directly or indirectly, these works reflected the preoccupations mentioned earlier: respect for prior cultures, anger at historical injustice, and admiration for acts of stoic resistance, unrequited kindness, and redemptive solidarity.

Morris found new ways to honor these ideals when he became a left-Liberal activist in the antiimperial “Eastern Question Association,” one of several organizations formed in the late 1870s to oppose military interventions in Turkey and the Balkans. His active engagement in the first mass antiwar movement in British history deepened his distrust of mainstream political parties, strengthened his contempt for British imperialism, and kindled in him a newly awakened respect for working-class organization as a liberating political force.

As an active socialist speaker and writer from the early 1880s until his death in 1896, Morris drafted and delivered more than 100 essays and lectures devoted to art, labor, socialism, communism, architecture, and the aforementioned “lesser arts,” some of which appeared in *Hopes and Fears for Art* (1882) and *Signs of Change* (1888). In his early, Ruskinian essays and speeches, he argued plainly and conversationally that the industrial

order of nineteenth-century Britain had destroyed the environment, traduced natural human aspirations to make things of worth and value, and effectively reduced men to machines of mass consumption as well as of mass production. A truly just order, by contrast, would enhance workers' lives, "giv[e] us pleasure in our work," and create real added value in the form of an "art made by the people for the people as a joy to the maker and the user" (as quoted in Morris 1910–15, Vol. 22, 5 and 80).

In 1884, Morris helped found a new organization called the Socialist League, which he helped sustain for six years as an indefatigable writer, speaker, and editor of its weekly newspaper *Commonweal*. Ill health began to abridge his activities in 1890, and he devoted much of his energy in the last six years of his life to the Kelmscott Press, a venture in book design that is still studied as a landmark in the history of fine books.

In his many essays in the mid- and late-1880s and 1890s, Morris denounced what he called "commercial war," a perpetual state of overt violence, covert coercion, and relentlessly forced overproduction of shoddy "goods" shoved down workers' throats, luxury "goods" that served no human needs, and destructive "goods" used to sustain the commercial and territorial ambitions of the British empire. In "Useful Work Versus Useless Toil" (1884), for example, he argued that:

[I]t is this robbery (there is no other word for it) which wastes the available labour-power of the civilized world, forcing many men to do nothing, and many, very many more to do nothing useful; and forcing those who carry on really useful labour to most burdensome over-work. (as quoted in Morris 1910–15, Vol. 23, 109–10)

In place of this perpetual war, he advocated communism, a state in which all would do the work they can, and all would have access to the means of production:

The resources of nature therefore, and the wealth used for the production of further wealth, the plant and stock in short, should be

communized. Now if that were done, it would at once check the accumulation of riches. No man can become immensely rich by the storing up of wealth which is the result of the labour of his own brain and hands. (as quoted in Morris 1910–15, Vol. 23, 271)

Especially important to Morris was the *quality* of human work, for “all labour, even the commonest, must be made attractive” (as quoted in Morris 1910–15, Vol. 23, 111). It should, that is, be varied, unforced, undertaken in conditions of adequate rest, and grant a measure of freedom and creativity to each worker “since . . . the main pleasure of life is the exercise of energy in the development of our special capacities” (as quoted in Morris 1910–15, Vol. 23, 137).

For *Commonweal*, which he edited from 1885 to 1890, Morris drafted three major literary works in serial form: *The Pilgrims of Hope* (1885), a tribute to the Paris Commune; *A Dream of John Ball* (1886), a memorial evocation of the Peasant’s Revolt of 1381; and *News from Nowhere, or An Epoch of Rest, Being Chapters from a Utopian Romance* (1890), a utopian vision of a future society that became his most-cited literary work.

Predictably, his contemporaries Karl Marx and Friedrich Engels considered Morris a “sentimental socialist” (Engels to Laura Lafargue, as quoted in Thompson 1976, 471). But there was nothing naive about Morris’s remark, to a correspondent on December 30, 1887, that

[s]ocialism does not rest on the [“scientific” and “determinist”] Marxian theory; . . . the disproving of a theory which professes to account for the facts, no more gets rid of the facts [of inequality] than the medieval theory of astronomy destroyed the sun. (as quoted in Kelvin 1985, Vol. II, 729)

Here and elsewhere, Morris articulated a deeply held broad-left insight—passed down from generation to generation—that “socialism” is an ethic, while dogmatic Marxism is a positivist pseudoscience. Put somewhat differently, his artistic gifts, egalitarian ideals, and faith in the social value

of the “lesser” arts gave a pragmatic as well as aesthetic turn to his personal view of “the Social-Revolution” and gave voice to the ethical ideal—also passed down from generation to generation—of counter-cultural resistance to a smug, philistine, and overwhelmingly hypocritical commercial oligarchy.

Morris’s original family had made “a deal” of money from a strip mine in Devonshire that extracted arsenic after its copper gave out. Possibly mindful of this, he understood, personally and *avant la lettre*, that forced labor and environmental squalor—whether imposed by Roman imperatores, medieval liege lords, corporate oligarchs, or their state-capitalist counterparts (“masters” all)—always, and by definition, “take the hindmost”:

[R]emember that poverty driven below a certain limit means degradation and slavery pure and simple. . . . {A}nother class which we shall never get rid of as long as we are under the tyranny of the devil take the hindmost . . . is the Class of Victims. Now above all things I want us not to forget . . . the fact that the riches of the rich and the comfort of the well-to-do are founded on that terrible mass of undignified, unrewarded, useless misery. . . . Will you think it monstrous that some people have conceived another hope, and see before them the ideal of a society in which there should be no classes permanently degraded for the benefit of the commonweal? (as quoted in Morris 1910–15, Vol. 23, 183–85)

If the man who drafted the passages just quoted was a “sentimental socialist,” it was not in his understanding of economics, but in his refusal to acknowledge human desires to dominate and susceptibilities to inhumane behavior. His views of town planning, architecture, people’s history, environmentalism, fostering of arts and crafts, and pleasurable fulfillment in labor have inspired many social-democratic “palliative measures.” And his outcries against jingoist groupthink, market-driven imperialism, and manipulation of the poor with tainted bread and shoddy circuses have made a deep and enduring contribution to an understanding of what a truly “socialist” society would have to be.

566

Mosca, Gaetano

Gaetano Mosca (1858–1941) was a political scientist and jurist and a pioneer, along with the economist and sociologist Vilfredo Pareto, of elite theory. Mosca was born in Palermo in Sicily in 1858 and educated at Palermo University. He combined an academic with a political career, teaching constitutional law, public law, and political science in Palermo, Turin, and Rome, and he served starting in 1908 as a conservative-liberal deputy in parliament. From 1914 to 1916, he was undersecretary of state for the colonies, and in 1918, he was appointed a life senator. Mosca was also a regular contributor to newspapers, including the *Corriere della Sera* in Milan, but increasing governmental censorship in the later 1920s induced him to withdraw from journalism.

Although he was highly critical of democratic institutions in his early writings—sharing the disillusionment felt by many from the early 1880s at the way parliament operated in Italy, with its corrupt electoral practices and ill-defined and seemingly unprincipled parties—Mosca came to regard representative government as in fact the least defective of political systems. In 1925, after Mussolini had established his dictatorship, he was one of the signatories of the Manifesto of Antifascist Intellectuals drawn up by the liberal philosopher Benedetto Croce. However, Mosca refused subsequently to take any public stance against Mussolini's regime, confining his opposition to a few incidental remarks on the virtues of representative government in his writings on the history of political ideas, which

constituted his only significant output in the fascist period. He remained a senator until his death in Rome in 1941.

Mosca's two most important studies were the *Teoria dei governi e governo parlamentare* (Theory of Governments and Parliamentary Government), published in 1884, and the 1896 work *Elementi di scienza politica* (The Ruling Class). In these works, he pursued a similar line of thought to Vilfredo Pareto—whose views on the distinction between elites and masses appear to have been arrived at independently and more or less simultaneously. Mosca argued that, throughout history, every society, irrespective of its character (whether it was bureaucratic, plutocratic, military, or religious) and of the fundamental myth or principle on which it sought to base its authority (the will of God, the will of the majority, or the dictatorship of the proletariat) was in fact ruled by organized minorities. Even in a representative system, he suggested, it was not so much the voters who chose the leaders but the leaders who imposed themselves—often unscrupulously—on the electorate. In the case of Italy, he maintained that the Chamber of Deputies in practice represented only the narrow economic interests of the propertied classes, and he advocated intervention by the state to curb the imbalances and injustices that derived from unbridled liberal individualism. He also sought a transformation of the ruling classes to ensure that talent and ability prevailed.

Mosca disliked the term “elite” on the grounds that it implied an often unwarranted moral superiority, and he preferred instead the more neutral concept of the “political class.” He accepted Karl Marx’s idea about the ubiquity of class divisions and conflicts, but he rejected the notion that these might be eliminated: A ruling class could be overthrown, but it would necessarily, he maintained, be replaced by another.

Mosca saw the composition and the manner of ruling of political systems as oscillating between alternative poles or “principles.” A ruling class could be based on inheritance (the “aristocratic principle”) or be open to talented individuals from the lower classes (the “democratic principle”); rulers might heed the wishes of the ruled (the “liberal principle”) or disregard them (the “authoritarian principle”). In common with classical writers such as Aristotle, Mosca—who considered himself a liberal—was inclined to see

the best political system as one in which none of these principles was pushed to an extreme. The liberal and authoritarian principles should be balanced, and although the hereditary principle could result in the ossification of the ruling class, a degree of closure might be beneficial, in that it could reduce the intensity of the struggle for power and allow for the transmission of valuable skills and traditions.

Mosca had no interest in methodology or philosophy, and he did not subject many of his generalizations to serious empirical scrutiny. Nevertheless, his main work, the *Elementi di scienza politica*, remains unsurpassed as a general treatise on politics.

Multiculturalism

Multiculturalism is a political ideal and citizenship model that reflects a commitment to creating a pluralistic and diversity-endorsing society in which members of different identity groups are accepted as equal citizens without having to discard cultural or religious markers that they perceive as significant, such as the Islamic headscarf (hijab), the Sikh turban, or the Jewish yarmulke. Multiculturalism also entails a rejection of monoculturalism or the privileging of a dominant majority culture and relegation of minority communities to a marginalized, second-class position. Instead, multicultural policies involve the development of measures of recognition and redistribution of material and symbolic goods that make “differentiated” (as opposed to uniform) citizenship the new standard. The aim is to permit individuals to participate fully in shared spaces, such as the public school, the workplace, or the institutions of government, while expressing, if they so wish, particularized group-based practices and ways of life.

The Unique Challenges of Multiculturalism

Such affirmation of a vision of inclusion through the recognition of diversity marks a significant break from the traditional liberal and civic-republican conceptions that emphasized the importance of uniform or undifferentiated citizenship as a guard against the loss of social cohesiveness and trust among members of the same political community.

While criticizing as unrealistic or unattractive the edifice of liberal and civic-republican “culture-free” institutions, most defenders of multiculturalism nevertheless significantly rely on and affirm the liberal and democratic values of equality, freedom, autonomy, deliberation, and dialogue to justify a degree of public recognition of difference, within a new matrix of inclusive citizenship. The trickier issue is to find ways to translate these values into just and fair measures that make inclusive citizenship a reality that counters the marginalization of nondominant minorities, while providing viable equality assurances for all individuals, both within and across different communities and affiliations. Perhaps the clearest expression of this attempt to fit multicultural citizenship within these contours is found in the influential writings of Will Kymlicka, who argues that culture provides an important background condition for facilitating individual freedom and autonomy because it creates a context of choice in which we can develop our sense of social self and group identity, which in turn allows us to make meaningful choices about how to pursue our lives. His argument brings together the defense of group-differentiated rights with the acceptance of the primacy of the individual, seeing them as complementary rather than as oppositional to one another.

Yet persistent dilemmas remain: Should every claim that is presumably grounded in “culture” be respected by the state and the wider society? What if it harms others or limits their respective autonomy and spectrum of available choices? When conflicts arise, who, or what entity, should have the authority to determine which demands for exemption, accommodation, or self-governance should be respected? These hard questions evade any neat and simple answers. Indeed, they linger as a source of charged and ongoing deliberations in the world of scholarship and public-policy making, even among those committed to a model of differentiated citizenship; and they provide ample fodder for those who oppose and reject this vision.

Multiculturalism as an official policy was first inaugurated in the early 1970s in Canada and soon thereafter adopted in a modified form by Australia. The 1980s and 1990s saw a range of multicultural policies adopted by other countries as well. Yet even Canada and Australia, which have remained faithful to the core principles of multiculturalism as they entered the twenty-first century, have had to remain sensitive and vigilant to

the delicate balance that exists between respecting diversity and promoting equality. When contemplating how to integrate immigrant populations from diverse backgrounds and help them become new citizens, for example, these countries have invested heavily in encouraging naturalization, facilitating social and economic integration, and providing a secure path to membership while avoiding a heavy-handed demand for assimilation (or giving up one's heritage) as a precondition for gaining access to citizenship and the accompanying sense of belonging. The core idea of these policies is to encourage immigrants to embrace their new home country's identity while retaining their diverse and different backgrounds (linguistic, ethnic, racial, national, cultural, religious, and so on). Incorporating considerations of fairness and equity, the commitment to multiculturalism here treats diversity as a national asset, especially in the era of increased globalization.

The test of such a celebration of diversity lies, eventually, in its success (or failure) at making society more open and accepting of all its members, ensuring their dignity and equality as individuals with multifaceted affiliations. In the legal arena, this entails a search for a balance between a variety of accommodation measures designed to overcome injustices *between* groups while guarding against inequalities *within* communities. This latter aspect becomes especially pertinent in those cases where certain practices and ways of life defended by group power-holders as "traditional" and "authentic" end up disproportionately burdening historically vulnerable and marginalized group members, such as women, sexual minorities, cultural dissenters, and so on. This is not an easy task for any established citizenship model, let alone a relatively novel one such as multiculturalism. The current turn in many European countries against any measure of group-differentiated accommodation or exemption has led some to predict the diminishing fortunes if not the outright "death" of multiculturalism in the second decade of the twenty-first century. This may be an overstatement, but it does invite a critical exploration of the main arguments that have been launched against the justifications for, and the consequences of, multiculturalism. For the sake of analytical clarity and simplicity, these critical accounts are grouped into four categories: (1) the difficulties of defining culture; (2) the effects of multiculturalism on intercommunal relations; (3) concerns about intragroup inequalities; and (4) eroding the "ties that bind."

The Difficulties of Defining Culture

Contemporary discussions of citizenship and multiculturalism fail to treat group formation and claims for recognition as dynamic and political processes that involve power struggles and strategic maneuvering. A related critique is that multiculturalism falls into the trap of classificatory taxonomies, losing sight of the malleability and plasticity of any cultural tradition and the importance of interaction between groups in shaping identity. Legal scholars, for their part, have traced often distorted and ill-informed portrayals of cultural minorities in courthouses and judicial decisions, some of which result from defendants seeking to use a “cultural defense” in an adversarial criminal trial by presenting their individual misconduct or wrongdoing as behavior mandated by their respective culture—often much to the dismay of other members of the same community. This illustrates a broader set of questions that falls under the heading of the difficulties of defining culture: Who can and should speak for a minority community in charged inter- or intracommunal disputes? How to define “culture” or “religion” for the purposes of crafting justifiable policies of accommodation or exemption, and according to what criteria? Who gets silenced when the state “takes sides” in disputes concerning membership demarcation, or the distribution of rights and powers between group members? Yet another concern is that formalized, government-backed multiculturalism policies may inadvertently produce artificially fossilized and essentialized interpretations of living cultures and communities, turning fluid identities that are always in flux into more rigid, fixed, and uncompromising entities with potentially negative effects for the future growth and survival of the relevant tradition.

The Effects of Multiculturalism on Intercommunal Relations

The fear of group-based ghettoization and balkanization is perhaps the most familiar argument against multiculturalism: By recognizing and endorsing the expression of group-differentiated diversity in the public sphere, official multicultural policies can lead to a breakdown and loss of intercultural interaction and trust, the creation of “cultural walls” around ethnocultural

groups, and the encouragement of separation and isolation that, in a worstcase scenario, can lead to intercommunal hatred, conflict, and violence. The risks of having a democratic and peaceful society break down along such lines are seen as so significant that a retreat from multiculturalism is recommended. This demand may take a moderate or radical form. The moderate form may call for the abolishment of government support for cultural or ethnic voluntary associations or their identity-preserving events, encouraging instead a more classic liberal laissez-faire approach to the maintenance of cultural identities by members of minority communities. In other words, the state, according to these critics, should not be engaged in the business of protecting or maintaining minority cultures, leaving this to the “free market” of society.

For proponents of multiculturalism, however, the laissez-faire approach misses the crux of the problem. The basic motivation for adopting group-differentiated policies is to overcome cultural injustices that are typically rooted in unequal social patterns of representation and interpretation. Without proactive measures, there is little to ensure that these intercommunal inequities would ever be broken down or even mitigated. This in turn may affect the self-perception and freedom of members of minority cultures. This is a strong argument in principle, but it may not persuade those who are mostly concerned with nation-building, social cohesion, and the establishment of a shared political community that is founded on common basic principles. For skeptics of multiculturalism, the Dutch experience is instructive. From the early 1980s until the late 1990s, the Netherlands implemented perhaps the most generous group-differentiated set of national policies in Europe with the declared intention of empowering ethnic minorities (many of whom were immigrants that entered the Netherlands by virtue of asylum and family reunification programs). The state supported ethnic schools, media, and other services. The results were far from encouraging. Rates of employment, school dropout, residential segregation, welfare dependency, and a slew of other parameters documented a bleak picture of lack of integration and mobilization for members of nondominant communities. Whether a more integrationist policy would have helped will never be known. Instead, the rise of intercommunal tensions in the post-9/11 era, and the deadly violence

mounted against public figures in the “name” of Islam, led to the unraveling of group-differentiated policies in the Netherlands.

The radical avenue of retreat from multiculturalism may involve legal demands that newcomers express a commitment to the “dominant values and norms” (however defined) of the host country, pass language and “integration tests” if they are already in the country, or take preadmissions tests if seeking entry from abroad. These tests often apply only to those deemed “too different,” namely, non-Western migrants, who are increasingly seen as unwanted and unwelcomed in many European countries. The potentially coercive and exclusionary implications of these new counter-multiculturalism policies are demonstrated by France’s demand that individuals refrain from expressions of certain group-based markers of (religious) identity in their interactions as citizens in public spaces, as exemplified by France’s 2004 national legislation that banned conspicuous religious attire from public schools, including the donning of a Muslim hijab; the 2008 decision of the Conseil d’État declining citizenship to a Muslim woman who spoke French, was married to a citizen, and had three French children (she wore the niqab and declared that she had no knowledge of the principle of *laïcité* and the right to vote) because “she had adopted a radical practice of her religion, incompatible with essential values of the French community, particularly the principle of equality of the sexes.”

These developments illustrate another, less often discussed, angle of the intercultural implications of debates about multiculturalism. Arguably, once the “genie” of identity claims is released from the bottle, it can no longer relate only to the justice claims of minority communities. Especially at times of political upheaval or social tension majorities, too, can make *their* claim to distinctive ethnocultural or national values, norms, and traits, making it potentially far harder for nondominant members to gain full inclusion or even mere legal admission (if they are not citizens). This potential slippage is the dark side of multiculturalism.

Highlighting Intragroup Inequalities

Governmental policies recognizing group-based claims for accommodation or exemption from general laws may have serious and potentially detrimental implications on those who traditionally wielded less powerful positions within minority communities, such as women, religious or cultural dissenters, and sexual minorities. There is a rich body of feminist literature highlighting the concern that an unregulated delegation of authority from the state to cultural minorities over their members in certain fields of social life, especially those involving the regulation and policing of marriage, procreation, and women's bodies, may place female group members in a vulnerable position that puts their rights and liberties as citizens at risk. This is particularly evident when women lack power or access to the tools of reinterpretation of a sacred tradition or where certain gendered practices or dress codes themselves become politicized markers of "identity." These tensions are particularly evident in the realm of family law, where women are often celebrated by their communities as important "cultural conduits" in the struggle to keep the group's distinctive traditions alive, while being asked to remain faithful to unequal structures of distribution of rights, responsibilities, and ultimately, power between men and women. Well-meaning attempts by the multicultural state to redistribute symbolic and actual powers between groups may end up exacerbating and legitimizing unequal practices within these communities.

While elaborating on this "paradox of multicultural vulnerability," relatively few scholars and activists have concluded that the best way to address these pressing realities lies in abandoning a commitment to respecting diversity. Instead, various attempts have been made to overcome, or at least diffuse, these tensions: placing individual autonomy and choice at the center of the analysis in lieu of endorsing an overunified and unchanging conception of culture; demanding that a non-negotiable baseline of human rights and protections be preserved under any regime of accommodation; and allowing access to courts and guaranteed representation for women's organizations in any major political or legal renegotiation of the terms of their community's jurisdictional autonomy, or degree of self-governance in the case of national minorities or indigenous peoples, within the confines of a federated or multilevel governance regime.

Despite obvious hardships and challenges, there are encouraging signs of revival of cultural traditions or reinterpretation of once gendered-traditions in a more egalitarian fashion. One such example is found in South Africa's recent history of recognizing customary laws as part of that country's post-Apartheid constitution, while also infusing gender equality and a "living tree" interpretative approach that permits revisiting unjust provisions from within the customary tradition itself. Other ideas include the development of mechanisms for shared or joint governance that create incentives for state and group officials to serve and address better the demands of women, religious or sexual minorities, or other historically marginalized subsets of the accommodated community. As with other multicultural developments, there is no single or inevitable path; the tensions that have erupted in Europe around the acceptable scope and limits of state intervention in regulating religious dress, especially the covering of the Muslim female body, serve as a fresh reminder of how charged these debates are, and how they are never free from histories of domination, "center" and "periphery" narratives, and broader struggles for recognition and social justice.

Eroding the Ties That Bind

The fourth and final line of critique reflects a deep trepidation that embarking on the path of multiculturalism is the first step toward removing whatever little remains of our shared citizenship in the era of increased globalization pressures. If we are merely united by our differences, what guarantees that citizens would identify with any particular home country, establish the trust and mutual responsibility required for a thriving democracy, or accept the duties of membership, including the commitment to make sacrifices at times of need? What is to remain of a common identity or set of unifying values? Would we still be speaking about sovereign states 100 years from now, or would we witness the disassemblage of territory, rights, and authority (to borrow from Saskia Sassen's terminology) or witness their replacement by either more local or more globalized conceptions of political membership, or perhaps a rise of both in combination ("glocalization")?

If we take full and equal access to society's institutions, centers of power, and the rewriting of narratives of collective identity that diffuse once-

entrenched hierarchical definitions of who belongs and who represents the polity as the ultimate goals of multiculturalism citizenship, then establishing fair terms of inclusion for members of nondominant groups is of paramount importance. It might encourage rather than diminish the identification of immigrants with their new home country, while addressing past injustices in respect of previously incorporated national minorities or indigenous peoples, providing more just terms for their future participation. Such an inclusive vision of multicultural citizenship demands transformation and mutual respect from established citizens and new residents. It marks a rejection of the pattern of demanding assimilation or conformity to the rules and traditions of the dominant national community; it involves instead an ethical and legal commitment to deep diversity and equality that is as remarkable as it is unprecedented.

National Socialism

The term *National Socialism* refers to a political movement and ideology born out of a series of tumultuous events in German history that culminated in the appointment of Adolf Hitler as Chancellor in 1933. National Socialism, also referred to as Nazism, was at its core ultraconservative, hypernationalistic, anticapitalist, antiliberal, anticommunist, anti-Semitic, and militaristic. On the political spectrum, Nazism is generally, although not always, understood to be a variant of fascism and thus a movement of the extreme right. Fascism itself is a revolutionary political philosophy and movement that grew in popularity in several European countries after World War I, exalting the nation above all else and calling for a strong authoritarian figure to fix the problems of the state, especially the rising tide of communism. The first fascist government to appear was that of Benito Mussolini in Italy in 1922. Italian fascism had a profound influence on Hitler. Both ideologically and practically, however, Nazism was far more extreme because of the overwhelming importance of racism in the movement. In fact, the political philosophy of Nazism is so deeply enmeshed in its fanatically devout ideology that many have dubbed it a political religion.

Although some scholars have sought to locate the origins of National Socialist thought in the sixteenth century or even earlier, Nazism was both a product of modernity and a peculiarly German phenomenon. Compared with other European countries, Germany is quite young, having unified its 300-odd independent states into the second German Empire only in 1871.

The formation of a large economic and military power with imperialist ambitions in central Europe at the end of the nineteenth century significantly altered the balance of power on the continent and ended with one of the most deadly and destructive events in world history, World War I (1914–18). Germany's defeat in that war by the allied forces of Britain, France, and the United States had profound effects. The Versailles Peace Treaty blamed Germany solely for the war, forced it to pay hefty reparations, confiscated large swaths of land, and demilitarized it. This punitive outcome left many in that country humiliated and bitter, perhaps none more so than Adolf Hitler.

Adolf Hitler was born to Alois and Klara Hitler (née Pölzl) in the small Austrian village Braunau am Inn in 1889. His middle-class childhood included both considerable conflict with his authoritarian father and utter devotion to his mother, whose death from cancer in 1907 scarred the young man deeply. Hitler's father died in 1903 after suffering a pleural hemorrhage. Much to his parents' dismay, Hitler did not want to follow in his father's footsteps and become a civil servant but fancied himself a painter. This dream led the provincial young man to Vienna in 1908, where he spent five years that became critical in the formation of his worldview. Rejected twice by the Viennese Academy of Art and living on a meager orphan's pension, Hitler found himself painting postcards for spare change and living in a homeless shelter. Thus, the cosmopolitan capital of the Austro-Hungarian Empire that produced artistic and intellectual giants like Sigmund Freud and Gustav Mahler was not the Vienna that Hitler knew. He was surrounded by dejected vagabonds like himself who blamed their plight on everyone else. Hitler grew to hate much about the city and the empire in which he lived. He was a voracious reader and consumed large quantities of both the obscure crackpot theories that swirled around Vienna's underbelly and more popular political ideas. The anti-Slavism and Pan-Germanism of Austrian politician Georg von Schönerer, the anti-Semitic demagoguery of Vienna's Mayor Karl Lueger, and the theories of Aryan superiority from cult leader and former Cistercian monk Jörg Lanz von Liebenfels all influenced the young Hitler. It would, however, be incorrect to assume that his political worldview was already cemented at that time. There is little evidence to suggest, for example, that the trademark rabid anti-Semitism of the more mature Hitler was already in place. But that would soon change.

At the age of 24, Hitler avoided mandatory military service in Austria by moving to Munich, Germany. Fed up with the Habsburg monarchy, ineffective parliaments, and multiculturalism and “race mixing,” Hitler could not bear the thought of serving in Austria. His arrival in Germany in 1913 signaled a new sense of belonging, but his bohemian life still seemed aimless. The assassination of Archduke Franz Ferdinand (the heir to the Austrian throne) in Sarajevo in June 1914 changed Hitler’s situation by triggering the outbreak of World War I. The ensuing wave of German nationalism and patriotism swept Hitler up, and he volunteered to fight with the Bavarian infantry. His life now had meaning. He served as a message runner and was injured twice, earning the Iron Cross First and Second Class for valor. Lying in his hospital bed in Pasewalk, Germany, in November 1918 recovering from what new research suggests was probably psychosomatic blindness and not a mustard gas attack as he often claimed, Hitler first learned of Germany’s defeat, the abdication of the Kaiser (German for “emperor”), the naval mutinies, and the subsequent revolution, which threatened to turn the country communist. It was at that exact moment, Hitler later claimed, that he decided to enter into politics.

The dissolution of the monarchy in Germany brought the Social Democratic Party (SPD) to power in 1919, beginning the country’s first experiment with democracy. The Weimar Republic (1919–33), so called because its constitution was crafted there to avoid the revolutionary mayhem in the capital of Berlin, was by no means doomed to failure from the outset. It did, however, face severe political, economic, and social turmoil. Having been created in haste and seemingly foisted on Germans, the Weimar government soon became wildly unpopular with the majority, not least because it had negotiated the humiliating terms of what became known as the “Versailles *Diktat*.” Such an environment made the perfect breeding ground for conspiracy theories of the radical right, and none was more intoxicating or dangerous than the stab-in-the-back legend. According to the myth, the German military had not been defeated on the battlefield but had been, like the Teutonic hero Siegfried in the medieval German epic “The Song of the Nibelungs,” stabbed from behind by a traitorous foe. In this case, German defeat was alleged to have been stage-managed by internal civilian enemies, namely Jews, communists, and Social Democrats. Although untrue, the stab-in-the-back legend found much popular appeal as it squarely placed the

burden of defeat in World War I on the shoulders of the Weimar Republic and Jews. Hitler, who labeled the supposed traitors the “November criminals,” believed in the conspiracy wholeheartedly, and it too had a profound effect on his political thought.

Without money, a vocation, or job prospects, Hitler remained in the army after the war and worked as an informant. Ordered to infiltrate a fledgling political group in Munich called the German Workers’ Party, Hitler, to his surprise, liked much of what he heard at the meetings. On September 12, 1919, Hitler caught the notice of Party founder Anton Drexler when he spoke out for the first time during a meeting at the Sterneckerbräu (beer hall). Spurred on by his military superiors, Hitler soon became the fifty-fifth member of the Party and its most prominent speaker. Hitler soon realized he had found his calling and by 1920 left the army for politics. That same year the party was renamed the National Socialist German Worker’s Party (NSDAP), and the beer-hall rabble-rouser quickly moved to the top because of his oratorical abilities. Unlike so many stodgy politicians of the time, Hitler used emotion to connect with his audiences. Simplicity of language, repetition, and clearly stated, unequivocal positions were part and parcel of his success. His speeches began slowly and quietly to draw the crowds in but increasingly intensified. Carefully choreographed gestures, a quickening pace, and an ever louder voice would bring audiences to a frenetic state at his climactic conclusion. His difficult childhood, war experience, and disdain for the Weimar Republic, all well-rehearsed topics in his speeches, led many to believe that he was one of them and understood their predicament.

Outside of Bavaria, Hitler and the NSDAP were little known until catapulted into the headlines with an abortive coup attempt in November 1923. In an act known as the Beer-Hall Putsch, Hitler and a large band of Nazis stormed a meeting at the Bürgerbräukeller in Munich proclaiming the creation of a new government with well-known war hero General Erich Ludendorff. This attempt to topple the Bavarian government was met the next day by a hail of police bullets on Munich’s Odeonsplatz. Hitler escaped unharmed, but 16 Nazis and 3 policemen died. Tried for high treason, Hitler was allowed by sympathetic judges to use the trial as a public stage for his political intentions. Casting himself as the patriotic,

would-be savior of Germany, Hitler received the minimum five-year sentence but was paroled after eight months in Landsberg prison. Hitler later remarked that his incarceration was his “university paid for by the state” as it allowed him time to catch up on reading and write his turgid, rambling, and often illogical autobiography/political treatise *Mein Kampf* (“My Struggle”). What is more, Hitler learned a vital political lesson from the failed *putsch*; he would have to come to power not by force but through normal channels with support of the masses and the backing of powerful sectors in German society.

National Socialism was always much more a social and political movement than a sophisticated, well-organized political ideology. Even the success of Alfred Rosenberg’s *The Myth of the Twentieth Century*, which was published in 1930 and attempted to provide a theoretical basis for Nazism, remains qualified. Although a best seller from the official Party ideologue, it seems to have been widely owned but little read. Hitler himself found it incomprehensible and never finished it. Nonetheless, from the extant sources, it is possible to list a set of more or less coherent thoughts that made up Nazi ideology. At its core was a racial, Social Darwinist understanding of history. Human races as well as nations, it was believed, were locked in a struggle for survival, and only the most powerful and ruthless would survive. At one time there had been a clear hierarchy of races, but because of miscegenation, this was no longer the case. Such interbreeding caused the decline of the once great (mythic) Aryan German race. If Germany was to become a great world power again, it would need to purge society of all enemies and their influence. It would not be an overstatement to suggest that the utmost prerogative of National Socialism was to create a “racial state.”

The foundation on which Nazism stood was the German *Volk* (“nation” or “people”). Germans were to put their nation and racial comrades above all else, especially themselves. National Socialism sought to create a harmonious national/racial community referred to as the *Volkgemeinschaft*. This community of pure-blooded Germans would work together in a classless society under the leadership of a single, strong leader (*Führer*) for the betterment of the collective. Paramount to the regeneration of Germany was the eradication of “aliens,” above all the ultimate nemesis of Nazism,

the Jews. Unlike Aryans, Hitler wrote in *Mein Kampf*, Jews were the “destroyers of civilization” and were “parasitical.” Although less than one percent of the population in Germany, the Jewish “race” was blamed for everything wrong with Germany and everything the Nazis did not like, from communism and modern art to democracy and capitalism. Immediately after the seizure of power, Nazi legislation such as the Civil Service Act (1933) and Nuremberg Laws (1935) began to strip German Jews of jobs, property, citizenship, and civil rights.

The Nazi consolidation of political power after 1933 was referred to by the legal term *Gleichschaltung* (literally coordination or synchronization), and its main goal was to bring all aspects of German society under the regime’s heel. State governments became wholly subordinate to the national government. Professional and civic organizations were dissolved or converted to Nazified versions of their former selves. The army and the legal and educational systems were “coordinated,” often willingly, in short order. Labor unions and political parties were banned. Interestingly, the first concentration camp, at Dachau (just outside of Munich), was opened in March 1933, not to house Jews but to deal with the massive wave of arrests of communists made by police. Although highly critical of free-market capitalism, the Nazi government made no sweeping economic changes and no real attempt to establish a corporatist state. Although there was certainly far more government regulation and oversight, profitable business practices often bolstered the regime’s political objectives, thus making radical economic change unnecessary.

Another central tenet of Nazism was the belief in the need for *Lebensraum* (“living space”) in Eastern Europe. The third demand in the NSDAP’s official party platform demanded new territories for the “nourishment of our people and settling of our surplus population.” The inability of Germany to feed itself off its own land was deemed to be a major cause of its defeat in World War I. The loss of colonies after Versailles only poured salt on wounds. Such a goal could be achieved only by force, and in the mid-1930s, Germany began a massive rearmament campaign followed by the invasion of Poland in 1939 and the beginning of World War II. After swiftly defeating the Poles and their French allies, Nazi Germany set its sights on the Soviet Union in June 1941, despite the nonaggression pact that had been

signed by Hitler and Stalin in 1939. The Soviet Union, and the resources of the Ukrainian “breadbasket” in particular, were a sort of holy grail in Hitler’s quest for living space. Once conquered, the Slavs of Eastern Europe, who were considered *Untermenschen* (“subhumans”) in Nazi ideology, would become slave laborers for their new Aryan masters.

It is clear, then, that at its core Nazism’s political philosophy was undergirded by hatred and violence. Even in the tumultuous years after World War I, however, the radical stance of the NSDAP did not resonate with Germans. In 1928, the NSDAP received less than three percent of the vote. Only after the bottom dropped out of the world economy with the Great Depression beginning in 1929 did Nazism’s promises of bread, work, and the return of the respected, powerful German empire receive notice. Yet the Nazi Party never received a majority vote in national elections. Hitler was the appointed, not the elected, chancellor of a conservative coalition wherein it was believed he could be easily manipulated and controlled. But he was underestimated.

The inevitable outcome of Nazism was World War II, an incomparable event in history with perhaps more than 60 million dead, including the 6 million Jews murdered in the German Holocaust. Despite its horrifically violent and genocidal past, National Socialism is not dead. Neo-Nazism, the attempt by hate groups to revive in part or whole German National Socialism after 1945, has sprung up across the globe. Often linked to white supremacist or skinhead movements, neo-Nazis uncritically mimic the ideas of Hitler, applying them to present conditions. As shown by the racially driven “kebab” murders of the National Socialist Underground in Germany during the first years of the twenty-first century, vigilance is required to make certain that the terrorist activities of present-day fascists remain the infrequent actions of the lunatic fringe.

Nationalism

Nationalism is one of the most influential political and cultural components of modern political thought and human cultures. It shapes the institutions and policies of governments, the collective identities of large social communities, and the personal identities of most individuals. Modern education systems teach people the meaning of their nations and portray nationality as a key aspect of modern selfhood. Nationalism also influences public activities such as voting, holding government offices, serving in military forces, paying taxes, organizing commerce, practicing professions, and attending sports events.

Governments draw on nationalist ideas to justify their laws, control their citizens, wage their wars, and collect their revenues. Nationalism has thus contributed to much of the creativity and to much of the violence in modern history. National identities express a perennial human desire to belong to social groups, but the distinctive characteristics of modern nationalist politics and cultures have only emerged over the last three centuries.

Nationalism's Political Ideas and the Development of Modern National Governments

Nationalist ideologies claim that individual human identities embody an essential connection to large groups of people who share specific geographical territories, particular languages, unique political and cultural

institutions, significant historical memories, and (perhaps) similar religious beliefs or ethnic traits. Although various nationalisms propose very different ideas about how to organize government institutions or promote cultural traditions, they almost always seek to establish political states that will defend a “national territory” and protect a “national population.” Nationalism provides abstract theories and emotional commitments that link political institutions to the cultures they govern and the individual citizens they control. This combination of political power, cultural traditions, and personal identities often evokes strong human emotions because it connects nationalism to families and daily life within the geographical space of well-bounded national territories and within the historical time of widely narrated national memories.

Nationalism thus evolves through the interplay of political and cultural ideas that explain how a person’s well-being and identity depend on citizenship in a nation. These closely connected political and cultural dimensions of national life and individual identity lead most scholarly analysts to describe nationalism as an outgrowth of modern political institutions and cultural systems rather than an expression of ancient or primordial human communities. Nationalist accounts of specific nations, however, often refer to long-existing traditions or identities because such histories demonstrate how each nation both resembles and differs from other nations. Every nationalism resembles others when it claims to represent a sovereign population, unique culture, and collective history, but every nationalism also asserts its difference from other nations because the emphasis on national differences justifies the creation of independent national states, all of which establish cultural and political boundaries to separate insiders from outsiders and claim the sovereign right to protect the collective interests of their national populations.

The history of nationalism as a political and cultural theory is usually traced to eighteenth-century writers in Europe and America who began to argue that independent states should govern clearly bounded territories and embody the sovereignty of large populations rather than the sovereignty of kings or the privileges of nobles. Nationalism therefore became an influential idea in the “modernizing” political, cultural, social, and economic processes that gradually replaced older social hierarchies and

transformed the “subjects” of sovereign kings into the “citizens” of sovereign nations. Although nationalism produced new forms of political and social exclusion, nationalist theories usually promoted “horizontal” conceptions of equal legal rights for individual male citizens rather than older “vertical” social systems that granted different rights to legally defined social groups.

This concept of equal legal rights (for white men) attracted growing popular support in late eighteenth-century America and France, and the French revolutionary movement after 1789 became especially influential in defining a modern political community that expressed both the sovereignty and the will of a large national population. French radicals eventually justified the overthrow of the long-ruling Bourbon monarchy by arguing that sovereignty comes entirely from the people of a nation and that sovereign nations (as well as the individuals who live in them) have fundamental rights to liberty and equality. These arguments for national sovereignty and human rights drew on the ideas of writers such as John Locke, Charles-Louis Montesquieu, and Jean-Jacques Rousseau who had challenged the traditional theory that kings ruled by divine right. Eighteenth-century political theorists increasingly argued that legitimate governments rested on a “contract” with the people they governed, which meant that the “people” became the ultimate source of national sovereignty. The people could only exercise their sovereign power, however, when they were free from external control and protected by an autonomous government. Rousseau and other theorists thus contributed to the new idea of national sovereignty by imagining that each sovereign state would implement the “general will” of a national population and that the national state’s sovereign existence would take on the legitimating “divine” qualities that earlier generations had ascribed to God and kings.

Although this evolving contractual view of the state and its citizens did not necessarily mean that people would have more personal freedom, the late eighteenth-century definitions of national sovereignty soon became linked to new ideas about individual human rights. Enlightenment-era beliefs in human reason suggested that autonomous individuals, like the autonomous nations to which they belonged, should be free to pursue the truth in religion, science, or politics. The political revolutions in America and

France thus extended the new theories of sovereign national rights into declarations about individual rights and liberties, thereby setting up a tension between the possibly competing rights of nations and the rights of individuals. In fact, the new nationalist argument for the sovereign rights of autonomous nations often overwhelmed the parallel arguments for the rights and freedoms of autonomous individuals. The nationalist theory nevertheless pointed toward a reciprocal exchange in which the nation would protect the rights of individuals and the individual would defend the rights of the sovereign nation; and the two kinds of rights would be integrated into the lives of individual citizens. As people gained freedom from older hierarchies that had prescribed their inescapable place in political and social systems, nationalism and the nation-state would provide new ideologies and institutions to assure their continuing connection to a larger, coherent social community.

Nationalism and individualism therefore evolved as related but sometimes conflicting theories of human rights. The “nation” could offer new political integration for societies whose monarchs had lost legitimacy and whose individuals no longer lived within a carefully delineated social hierarchy. Nationalism emerged in this changing historical context as a new cultural foundation to support modern political regimes that could range from popular democracies to the most repressive dictators (who also portrayed their regimes as embodiments of the nation’s sovereign will).

Nationalisms frequently invoked the “national past,” but their historical role in the various transitions to modernity gave nationalists a strong interest in the future. Nationalist movements since the eighteenth century have therefore usually sought to separate their ideas and actions from “old regime” institutions that seemed to impede the nation’s political freedom or the exercise of individual rights. The modern belief that every nation must have its own state carried accompanying expectations for a better national future. This theme emerged in the early nationalisms of North America and France, and it became a common assumption in the many other European and non-European nationalisms that claimed to represent the political aspirations of specific national populations, defend the human rights of freedom and legal equality, and guide their societies toward a stronger, freer era of national history. Although human rights were often violated in the

early national states, the American and French *theories* of national sovereignty and human rights gained wide influence through the American Declaration of Independence (1776) and the French Declaration of the Rights of Man and Citizen (1789). These famous documents described national and human rights with universalizing concepts that could be reaffirmed in different ways by later national movements throughout Europe, South America, Asia, and Africa.

Nationalism has thus shaped anticolonial movements against every empire and has generated numerous political struggles for secession or regional autonomy among self-conscious social groups within multicultural nations on every continent. Acting on the fundamental idea that governments must represent a particular national population, nationalist movements have emerged wherever political activists believed that their language, cultural traditions, local institutions, and economic interests differed from the culture and interests of an “alien” governing class or colonial power. This much-desired convergence of language, culture, and political power became a fundamental goal for late-nineteenth-century nationalist movements in places such as the Austrian and Russian empires of eastern Europe; and similar aspirations reappeared constantly among the colonized people who launched nationalist revolutions against European imperial systems in Asia, Africa, and the Middle East. The struggle to achieve both political and cultural autonomy thus became a common historical theme in the postcolonial societies that emerged from the collapse of transnational empires, but the complex interaction of politics and culture has also shaped all national identities—no matter how they may be defined as “old” or “new” in the history of nationalism.

Nationalism and Modern Public Cultures

Nationalist political leaders and national governments have attracted enduring popular support by promoting cultural themes and public rituals that teach people how to be national citizens. Nationalist cultural institutions have thus diffused new views of national sovereignty and human rights through the languages and symbols of national political discourses that can spread across national territories more quickly and effectively than national armies or bureaucracies. Schools, religious

organizations, and the modern culture industry have helped to instill national identities among the people of America, Europe, and every other place where nationalism became the ideological foundation for modern governments. The political nationalism that emerged in the French Revolution, for example, replaced the symbols and rituals that had long supported the French monarchy and launched the kinds of national, cultural campaigns that would reappear often in later nationalisms. The French created new clothing and songs to bring national, republican political themes into everyday life, and they introduced new public festivals, monuments, artwork, plays, “liberty trees,” liberty caps, and tricolor cockades to symbolize a regenerated French nation in which older images of saints and kings gave way to images of “Marianne,” a female symbol of the new republican state. National rituals conveyed a new political catechism that encouraged people to view the bonds among national citizens like the bonds within a family.

The French revolutionaries also promoted the unifying use of the French language, thereby establishing an influential linguistic theme that later nationalist movements and national states would repeat in their own campaigns to achieve political unity and independence. Although this linguistic emphasis became especially prominent in the later nationalist movements of central and eastern Europe, the public cultures of all nationalist groups have usually praised the political and cultural significance of a shared language. When people speak different languages, nationalists argue, they also express different ideas, develop different institutions, and eventually want different national governments. Nationalisms thus depend on a strong, living language, and each nation’s cultural influence and identity has required the constant work of national-minded authors and artists. Literature, history, and art showed how previous generations had sacrificed for the nation and contributed to the universal progress of humanity. Philosophers, poets, novelists, and historians have narrated the cultural meaning of nations for people who might never read the official declarations of political leaders, and nationalist “missionaries” have established new schools in even the most remote small towns to teach the national language and transform older forms of local identity. All nationalist movements have set out to “nationalize” the education and cultural knowledge of students and other young people.

Nationalism has also flowed into cultural life through newspapers, books, pamphlets, journals, maps, films, and radio or television broadcasts that placed people within national territories and linked their daily experiences to the ongoing history of a nation. Famous literary works and philological studies explained the distinctive history of words in national languages, and historians described historical continuities that linked current and past generations, stressing ancestral sacrifices to explain why and how the living must honor the dead through an unbending support for the nation. Histories of national sacrifice have thus tended to fuse the story of the nation and its heroes with older religious narratives about morality and sacrifice. Indeed, the calls for national service and sacrifice have often resembled ancient injunctions to serve a transcendent Being, and the rewards for such service have suggested new forms of salvation.

More people have died for their nations in modern times than for any other creed or political idea, which may explain why the modern identification with national symbols has frequently conveyed the kind of deep reverence that people express for their religious ideals. Like the sacred ceremonies of the world's ancient religions, nationalism's public cultural rituals provide collective and personal consolations for violence, sacrifice, and death. Although nations are not eternal, the ongoing existence of national communities has given modern people the comforting assurance that they are permanently connected to a greater power that exists long before and after the life of every individual. Duty to the nation could therefore be compared to a believer's duty to God because service to the nation advanced a sacred national mission. Drawing on religious conceptions of a "chosen people," nationalists have often believed that their nations were divinely called to promote a distinctive, moral cause in world history. Indeed, some "messianic nationalisms" in nineteenth-century Poland, Italy, and other European societies compared the struggles of their national populations to the sufferings of Christ and affirmed that recompense for this suffering would come in a national resurrection and future freedom for all who shared the pains of foreign occupation, political oppression, or lonely exile.

Even non-messianic nationalisms, however, have developed cultural analogs for traditional religious symbols, books, rituals, saints, holidays,

and moral lessons. The national flag of each national movement, for example, quickly became a sacred symbol, and nationalists praised their founding national documents with the reverence that religious leaders have always brought to ancient religious texts. Every nationalism celebrates virtuous “Founding Fathers” whose lives express the meaning of the nation, much as Moses, Jesus, and Mohammed conveyed the message or meaning of God. Nationalists have long made neo-religious pilgrimages to the birthplaces or tombs of national heroes, the sites of famous battles, and the graves of unknown soldiers. Christian accounts of Christ’s ultimate sacrifice for others offered a model for those many Western nationalists who found divine meaning in the modern causes of their nations. Christ-like images of sacrifice provided powerful European and American examples of what patriots and their families might ultimately have to give to their nations. The many soldiers and others who lost their lives to save the nation became the most hallowed figures in every nationalist ideology, and they were assured an earthly immortality in the collective national memory that preserved their language, ideas, and institutions. This nationalist emphasis on honorable sacrifices suggests how nationalism could transform warfare into the highest expression of national identity. The nation’s unity and ultimate survival depended on people who gave their lives in the struggles against national enemies, and soldiers became the highest embodiment of the national ideal because they died to give life and freedom to others. Nationalist ideologies have thus offered consoling explanations for death and moral justifications for the nation’s most violent public actions. But the emotionally charged themes of modern nationalism have also extended from government institutions, public cultural symbols, historical narratives, and neo-religious conceptions of sacrifice into the social relationships and family networks that shape and sustain all personal identities.

Nationalism, Gender, Family, and Race

Nationalism gained pervasive political and cultural influence when modern people began to include nationality among the main attributes of a personal identity, much like they referred to a person’s gender, family heritage, or race. Although national identities have often been viewed as inherited and natural, they are constructed through cultural processes that also shape an individual’s other “natural” identities. As modern institutions and identities

became increasingly “nationalized” during the nineteenth and twentieth centuries, the meaning of both gender and race became entwined with nationalist ideas that connected the personal spheres of individual lives with the public spheres of politics and collective cultural identities. These connections appeared in modern ideas about the family, reproduction, and personal respectability, which suggested that a “good citizen” was also a responsible member of a family (and vice versa). Ideas and anxieties about the family also overlapped with ideologies that claimed to show the biological meaning of race, and nationalism’s evolving view of human identities frequently referred to bodies as well as history.

Nationalist writings used metaphorical language to evoke emotional responses to the “fatherland,” “mother tongue” and “mother country,” “brothers-in-arms,” “founding fathers,” and the “national family.” Nationalisms have also developed male or female symbols to represent their national virtues. The meaning of England, for example, has often been conveyed in images of Britannia and John Bull; the Germans represented themselves with Germania; the Americans created Uncle Sam; and the famous “Marianne” symbolized France’s national virtue long after the French Revolution.

Most nationalists have therefore assumed that various gendered virtues and a firm loyalty to biological families provided a solid grounding for strong nations and a deep commitment to the nation provided coherence and continuity for strong families. The family resembled the school as an institution that could shape the national identities and commitments of young citizens. This view of the family’s nationalizing influence assigned a key national role to women because mothers were supposed to ensure the national identity of their children. Yet the woman’s essential national role actually began with the production of babies, which nationalists traditionally portrayed as a “passive” or “immutable” element of national societies that contrasted with the “active,” changing male duties in the nation’s public life. These gender themes in nationalist thought typically made women responsible for the enduring moral virtues that respectable families and nations passed on to their children. Nationalists have often described children as the pure embodiment of national virtues (along with

soldiers), and images of parents surrounded by their happy children formed a common theme in popular artistic representations of national virtues.

The biological themes in nationalist writings about families also influenced much of the nationalist concern with race. Although racial nationalisms lost respectability in most societies as people reacted against the genocidal violence of modern racist regimes such as Nazi Germany, nationalists in earlier eras often believed that so-called “racial traits” explained national differences in political and cultural institutions. Nineteenth-century nationalists in Britain and the United States, for example, referred to the “Anglo-Saxon” racial identity when they added biological categories to a list of distinctive national identities that included the cultural traditions of history, literature, and religion. In addition, nationalist thought in many countries promoted anti-Semitism or European imperial control of different “races” in Africa and Asia. The allegedly natural attributes of “race” nevertheless had to be cultivated in homes and schools, so that young people would understand how their “biologically shaped” gender roles and racial identities merged with the history of their nations. Domestic education therefore brought family life, moral virtues, and individual identities into the political and cultural life of the nation—and brought national histories into personal histories from early childhood until death.

Debates About Nationalism

Scholarly debates about nationalism have long reflected the national contexts in which the writers lived. Many of the early analysts and historians of nationalist ideas, for example, wrote national histories that described coherent, sovereign national states as the culminating political organization of long-existing social groups and collective identities. Recent scholarship, however, has generally portrayed nationalism as a distinctively modern political and cultural theory whose main components emerged with the rise of modern economies, centralizing political states, mass communication systems, and public education. This influential “constructivist” argument emphasizes the linguistic, ideological, economic, and neo-religious construction of nationalist states and cultures, but it continues to elicit criticism from “ethno-symbolist” theorists and “primordialists” who stress that no nationalist movement or identity can

develop without preexisting linguistic, cultural, historical, ethnic, religious, or social communities that sustain identity-shaping traditions and memories. Critics of the “constructionist approach” assume that nationalism’s exceptional political and cultural power cannot simply be “invented” or “imagined” because the emotional components of a national identity run very deep in the collective experience of any group that claims to be a “nation.”

In addition to the debates about the constructed or primordial aspects of nationalism, other arguments focus on the contrasting political or cultural themes in various nationalisms. Many historians distinguish between civic nationalisms (theoretically open to anyone who accepts the nation’s political ideas and institutions) and ethnic nationalisms (open only to those persons who embody a particular racial or ethnic identity). Accounts of civic and ethnic nationalisms often lead to arguments about “good” or “bad” nationalisms, and ethnic nationalisms are usually described as the bad ideologies that produced most of the racism, anti-Semitism, political oppression, ethnic cleansing, and warfare in modern world history. Other studies compare the traditional nationalist quest for “pure” or “fully coherent” national societies with a more recent multiculturalism that emphasizes the cultural diversity within all modern societies. Scholarly “culture wars” have erupted between those who condemn multiculturalism and those who argue that the inevitable differences within a nation will always block the nationalist aspiration for a “pure,” culturally unified national community.

Other scholars compare the nationalisms of long-established nation-states with the nationalisms of recently established, postcolonial nation-states to argue that nationalism is now less important for older governments than for newer national governments. Debates about the differences in older and newer nationalisms or “western” and “eastern” nationalisms also lead to questions about how globalizing economic forces and cultural systems may significantly weaken national government and nationalist identities. Despite the growing challenges of transnational economic, cultural, and technological changes, however, the beliefs in national sovereignty and national cultures continue to shape politics and personal identities almost everywhere.

Scholarly debates about whether nationalism is constructed or primordial, civic or ethnic, good or bad, and coherent or multicultural (and so forth) typically move from these broad theoretical claims to arguments about the specific components of nationalism: political and cultural institutions, economic systems, social life, and the ideas about religion, gender, language or ethnicity that shape nationalist ideologies. The opposing sides in each debate inevitably emphasize diverging political or cultural themes to support their general assessments of nationalism's significance, value, or danger. Furthermore, every generation encounters new nationalist violence and ideas that provoke new scholarly analysis and debates. The future scholarship on nationalism and the future political consequences of nationalist thought are therefore unpredictable, but the history of nationalism's far-reaching political and cultural influence suggests that it will surely remain a powerful force in modern states, international conflicts, and personal identities.

Natural Law

The notion of a natural law that governs all human beings throughout the globe and provides a standard for ethical behavior in all parts of the world has been a persistent feature of ethical thought from ancient times to the present. This entry discusses the evolution of natural law and its relevance to contemporary issues, and then considers some current empirical confirmations.

In the Middle Ages and the Renaissance, attempts were made to define key precepts of the *lex naturalis* (law of nature). Thomas Aquinas (1225–74), summarizing the efforts of prior philosophers and Roman jurists, focused on three pivotal inclinations of human nature, which superseded other inclinations and had the force of law:

1. the law of self-preservation, which humans have in common with all beings in the world;
2. the law of procreation and care for offspring, which humans have in common with animals; and
3. the law specific to rational beings to search for the truth and to organize social structures in reasonable and harmonious ways.

These precepts were expanded and reformulated by later scholastics in the Catholic tradition. The Spanish Dominicans Francisco de Vitoria (1492–1546) and Bartolomé de las Casas (1474–1566), responding to problems connected with colonizations and conquests in the Americas, developed

principles of the natural rights of indigenous peoples, as corollaries to natural law theory.

From the eighteenth century to the middle of the twentieth century, natural law theory became subject to criticism from a number of quarters. Jeremy Bentham (1748–1832), champion of a utilitarian approach to morality and politics, dismissed natural law as overly vague and subject to subjective and self-interested manipulations. David Hume (1711–76) argued against the tendency of moralists to derive an *ought* (duty) from an *is* (external fact); and numerous subsequent ethicists, considering “human nature” to be something merely existent and factual, considered natural law theory to be invalidated by Hume’s stricture. In the nineteenth century, Darwinists’ extension of the theory of physical evolution to social developments and the idea of evolving species, raised questions about any “constants” in human nature; and the Marxian connection of morality with political and economic relations portrayed ethics itself as historically determined, no longer regarded as an autonomous discipline.

In the mid-twentieth century, certain events led to a rethinking concerning the relevance and importance of natural law. First, the Nuremberg Trials of 1945 to 1946 in the aftermath of World War II, in which jurists from allied countries were engaged in judging “war crimes” by German officials whose actions were often legal under the then-prevailing Nazi government, raised questions about justification. Were the Nuremberg judgments of execution and imprisonment justified simply because of the fact that the judges belonged to the victorious countries? Or was there some higher law that could serve as a criterion for condemning certain civil laws and actions carried out in conformity with these laws? Second, when unprecedented advances in medical contraceptive technology in the 1960s led to the 1968 Encyclical Letter, *humanae vitae*, of Pope Paul VI, condemning artificial birth control and countenancing only natural family planning, critical discussion of the natural law regarding reproduction ensued. One result was the development by Germain Grisez and John Finnis of a “new natural law” theory, allegedly immune to Humean criticisms, and based on a set of presumably universal basic values. Finally, in the last few decades, natural law has been invoked in condemnation of genocide in Rwanda and Sudan.

In addition to philosophical arguments for the existence and validity of a natural law, two primarily empirical validations should be noted: Since the existence of a “right” implies a corresponding duty to respect that right and since broad agreement of the nations of the world produced the Universal Declaration of Human Rights by the United Nations in 1948, the natural rights included in that document (e.g., the right to life, the right to marry, the right to education and to a reasonable social order) would entail corresponding natural obligations. Likewise, anthropological corroborations of ethical universals in all societies, such as Donald Brown’s discovery of prohibitions of murder, rape, incest, and child abandonment in all societies, offer empirical support to the concept of natural law.

Negri, Antonio

Negri, Antonio

584

585

Negri, Antonio

Antonio Negri (1933–) is an Italian revolutionary political theorist who is influenced by Marxism yet critiques Karl Marx's ideas. Negri attends to social developments after Marx and contemporary political practice. At the outset of his academic career, Negri read Georg Wilhelm Friedrich Hegel and post-Kantian philosophy, which is reflected in his Ph.D. thesis (1956) and his first publication, *State and Right in the Young Hegel*. Negri read Hegel sympathetically in seeing the potential of dialectic as an open reflexive technique that could trace interconnections of theory and practice.

While a professor in Padua in the 1950s, he was a member of the Italian Socialist Party (PSI). He engaged seriously with Marx in the 1960s, and in 1963, he co-founded the left-wing political group Potere Operaio (Worker's Power), which supported workers' activism and direct acts of resistance to capital. In the early 1970s, he worked with the decentralized extra-parliamentary movement Autonomia Operaia (Workers' Autonomy), writing pamphlets and supporting workerism, the notion that workers could directly develop their own power and effectiveness. This self-valorization of workers and his recognition of changing social and economic conditions were distinctive aspects of his brand of Marxism. He observed how work had changed, with large-scale factory production declining in significance, and how distinctive issues of gender and ethnicity were on the contemporary agenda. The rise of Leninist military organizations such as the Red Brigades led to the murder of the Prime Minister Aldo Moro in 1978 and to a subsequent wave of repression. Negri was arrested for his

alleged role in fomenting violence. After his temporary release from prison in 1983, he fled to France, where he remained until 1997 when he returned to Italy and served the rest of his prison sentence until 2003.

Negri's critical Marxism embraced a critique of a universal measure of value that was set out in his text, *Marx Beyond Marx*, where he drew on the *Grundrisse*'s conception of the creativity of social labor. In recent years, Negri has joined with Michael Hardt to write important radical texts that depart from Marx in drawing on the practice of contemporary activism. These works, *Empire* (2000), *Multitude* (2004), and *Commonwealth* (2009), are ambitious in imagining revolution for a global age and in offering a social theory that critiques and absorbs a number of historical theorists including Baruch Spinoza, Hegel, Marx, Gilles Deleuze, Michel Foucault, and Niccolò Machiavelli. These texts repudiate standard notions of revolutionary change and working-class militancy, breaking with hierarchical conceptions of revolution, standard images of an industrial working class, and the idea of a radical party as a top-down agent of revolutionary change.

For Hardt and Negri, revolt is to be undertaken by the many, who are repressed—the multitude, a heterogeneous set of people whose commonality is their repression by Empire and their potential for creativity. Empire is the global power under contemporary conditions of capital, where power is not linked to particular states but to the processes of power exerted across the globe. The potential for revolutionary change is not linked to critique and elite insurrectionary action but exists immanently across the channels of bio-power. Crucially, these emerge from the common, which is revealed in *Commonwealth* to be the shared social connections and powers that the multitude enjoy, that supersede the narrow confines of production formally controlled by capital, and that are typically measured by the labor theory of value. The shared powers of the common are those powers that militate against the continuation of capital and drive the possibilities of radical change.

Negri is a challenging theorist who maintains that revolution is both necessary and will arise out of immanent global developments. His reading of this prospective change, though, is held to be nondialectical and

nonteleological, although its claims about the future and its links with the past appear to revisit classic dialectical themes.

Neoconservatism

Neoconservatism

585

589

Neoconservatism

Neoconservatism is a form of conservative thought that is particular, although not exclusive, to the United States. The term was introduced by socialist activist-academic Michael Harrington in 1973, referring pejoratively to a particular group of American intellectuals who had moved from the radical left to the right in the 1960s. Although the group turned out to be ideologically eclectic and individually fluid, with people moving into and out of it, the term stuck to a growing collection of members and institutions.

The term *neoconservatism* became widely used in the 1980s, describing the governments of Ronald Reagan in the United States and Margaret Thatcher in the United Kingdom. In the late 1980s, various commentators declared the death of neoconservatism, and the term saw little use in the 1990s. This hiatus changed dramatically when President George W. Bush ordered the invasion of Iraq, an action widely seen as a move prompted by neoconservatives (now often called “neocons” for short) in his administration. In particular, deputy secretary of defense Paul Wolfowitz’s doctrine of preventive invasion came to be known as the Bush Doctrine. In the post-Bush era, many neoconservatives have either denounced their former ideas or denied their influence within the administration. Some of the most prominent neoconservatives have even denied the very existence of neoconservatism. But although neoconservatism is once again declared dead, its most prominent individuals and institutions remain influential within the U.S. right.

What Is Neoconservatism?

Although the term *neoconservatism* is now broadly used in academic and nonacademic discourse, few clear definitions exist. In fact, the bare essence of neoconservatism is debated. Is it an ideology? Is it really conservative? (No, says populist Catholic conservative Patrick Buchanan [2004].) Does it exist at all? Irving Kristol, the unofficial “godfather” of neoconservatism, famously described neoconservatives as “liberals mugged by reality.” Probably the most popular self-definition within the movement, this one is both vague and not, or no longer, accurate.

Most authors, academic or nonacademic, use the term *neoconservatism* to denote a movement of intellectuals who share a common ideology. Exactly who belongs to the movement and what constitutes the ideology, however, often remains unmentioned or vague. Although certain intellectuals and institutions seem beyond dispute (e.g., Irving Kristol and *The Weekly Standard*), the inclusion of others is debated or limited to certain time periods (e.g., social scientist Daniel Bell or politician Daniel Moynihan). Many neoconservatives themselves have long been unwilling to accept the term, but even those who do self-ascribe as neoconservatives problematize its meaning and usage. They argue that the neoconservative movement, if it exists at all, is deeply divided over almost all key issues and cannot be said to share a clear ideology. Hence, they speak of neoconservatism in terms of a “persuasion” (Kristol), a “tendency” (Norman Podhoretz), or even a “sensibility” (Joshua Muravchik).

In ideological terms, neoconservatism can be defined as a combination of neoliberal economics, social traditionalism, and democratic interventionism. Neoconservatives believe that the market is the best economic system, but its optimal functioning depends on the spread of specific virtues in society. The state has a key role to play in the fostering and protecting of these virtues (e.g., self-discipline and personal responsibility). Finally, neoconservatives want to make the world in general, and their own country in particular, safe for democratic capitalism by aggressively supporting it in the world.

However, this definition borders on a Weberian ideal type, as many self-ascribed neoconservatives do not support all three ideological features to the same extent. For example, Jeane Kirkpatrick, former U.S. ambassador to the United Nations, fit the neoconservative definition in terms of her stands on foreign policy stands; yet she held fairly liberal social views. Even Irving Kristol has at times expressed doubts about aspects of this neoconservative agenda, while at other times embracing them. For example, up until the 1980s, he argued that foreign policy was irrelevant to neoconservatism.

Neoconservatism combines key aspects of all three main tenets of postwar American conservatism. The two share the belief in the market with libertarians, the importance of virtue with traditionalists, and the active fight against foreign leftist dictatorships with anticommunists. This similarity notwithstanding, neoconservatives have always been distrusted by other conservatives (see below).

The First Generation (c. 1960s-80s)

The origins of the neoconservative movement are to be found in a group of Trotskyist graduate students at City College of New York in the 1930s. Mostly children of poor Jewish immigrants, they engaged in fierce debates with their Stalinist colleagues in the City College cafeteria. Over the next few decades, the group, which included prominent social scientists like Daniel Bell and intellectuals such as Irving Kristol, would slowly but steadily drift to the right. Becoming staunch anticommunists, most neocons remained self-described Democrats until the late 1970s.

During the 1960s, the neocons grew increasingly critical of and disappointed with the Democratic Party and liberalism. They believed that the party had been overtaken by radicals, and they decried its soft position against communism both in the United States and abroad as well as its critical position toward Israel, a stance they held to be informed by anti-Semitism. They allied with liberal hawks such as Senator Henry “Scoop” Jackson (D-WA), whose young staff included many future leaders of the second generation of neoconservatives, including Bush officials Paul Wolfowitz and Richard Perle.

At the beginning, however, the neoconservative movement concerned itself mainly with domestic affairs. In 1965, Bell and Kristol founded *The Public Interest*, a journal that published critical analyses of liberal policies, mostly regarding welfare and affirmative action, by famous social scientists like Nathan Glazer and James Q. Wilson (both at Harvard) or Aaron Wildavsky (University of California at Berkeley). Unlike traditional conservatives, the neoconservative based their critiques on solid social science and emphasized the unintended consequences of state policies. They believed in the importance of ideas for politics and preferred a career as an intellectual over that of a politician. A key element of their ideology has been the importance of virtue, heavily influenced by the work on Victorian England by historian Gertrude Himmelfarb (Kristol's wife). According to the neoconservatives, virtue underlies both democracy and the market and should be protected and encouraged by the state.

In the 1970s, the neoconservatives increasingly moved away from the Democratic Party and extended increasingly beyond their urban, Jewish, former-Trotskyist base. Their relationship with the traditional right remained strained, and the movement's most prominent "converts" were liberal hawks from the Democratic Party such as Jeane Kirkpatrick (then a faculty member at Georgetown University) and politician Daniel Patrick Moynihan (New York), although the latter openly broke with the neocons soon after. The movement embraced the free market even more strongly and increasingly stressed the need for a strong anticommunist stand inside and outside of the United States. In 1985, Kristol founded *The National Interest*, which dealt primarily with foreign affairs. Until then, *Commentary*, the official magazine of the American Jewish Committee, edited by prominent neocon Norman Podhoretz, had been the major outlet for neoconservative foreign-policy analyses.

Ronald Reagan was the first Republican President to be largely and openly supported by the neoconservatives. Although the Reagan administration was broadly perceived as the high point of neoconservative power, at least until the presidency of George W. Bush, few neoconservatives held prominent positions within the administration, and many grew increasingly disappointed with Reagan. In the late 1980s, with the election of the moderate realist George H. W. Bush, the neoconservatives disappeared

from the public eye, and both friends and foes proclaimed its demise. For example, in 1996, *Commentary* published an essay titled “Neoconservatism: A Eulogy,” written by none other than Podhoretz himself.

The Second Generation (Since the 1990s)

Although declared dead in the mid-1980s, neoconservatism came back with a vengeance in the early twenty-first century. Obviously, it had never truly disappeared; rather, it had left the administration and returned to its journals and think tanks. However, although first-generation neoconservatives such as Irving Kristol and Norman Podhoretz remained influential, it was their sons and daughters, like William Kristol and John Podhoretz, who became the leaders of the second generation, in part through their influential publication, *The Weekly Standard*. The second generation of neocons differs in important ways from their parents. First, they did not go through a left-wing phase. Second, they are much more partisan than their fathers.

Although, like the first generation, many work for journals and think tanks, most are openly aligned with and involved in the Republican Party. A good example is Bill Kristol, who worked as Chief of Staff for William Bennett, Secretary of Education in the Reagan administration, and Dan Quayle, Vice President in the George H. W. Bush administration. Unlike many other second-generation neoconservatives, Kristol did not get involved in the George W. Bush administration, but he did function as foreign-policy advisor to the 2008 Republican presidential nominee, Senator John McCain, and his running mate, Sarah Palin.

A third aspect in which the second generation differs from their intellectual fathers is in the radicalism of their foreign policy. Not only is foreign policy their key concern, overshadowing economic and particularly social concerns, but they are also much more visionary in their goals and militant in their means. Although the first generation was anticommunist and demanded strength abroad and at home, most early neocons shied away from military and interventionist policies. Moreover, they had an innate skepticism toward the possibility of externally enforced regime change. The second generation also supported the extensive buildup of the military, and the increased vigilance toward internal threats, but also in addition pushed

for an interventionist foreign policy, unilateral and military if necessary. Particularly under the Bill Clinton administration, neoconservative organizations like the “Project for a New American Century” (PNAC) would push for a significant increase in the defense budget and for military intervention and regime change in countries like Bosnia-Herzegovina and Iraq.

Neoconservatism and the Iraq War

Although George W. Bush was elected on a platform of “compassionate conservatism,” which had little to say on foreign policy, his administration will forever be linked to neoconservatism. In fact, throughout his term, relatively few neocons served in the Bush administration. However, taken by surprise by the terrorist attacks of 9/11, the few, strategically placed neocons were able to define the response to the new threat, with the strong support of Vice President Dick Cheney.

The PNAC’s report “Rebuilding Defenses: Strategy, Forces and Resources For a New Century” (2000) functioned as the blueprint of the Bush administration’s response to 9/11. The neoconservative foreign policy, also referred to as “hard Wilsonianism” (Max Boot) or “Wilsonianism on steroids” (Walter Russell Mead), was built on the assumption that the United States and its allies were safest in a world of democracies. Its two main goals were (1) to extend the “unipolar moment” (Charles Krauthammer), i.e., American hegemony, as long as possible; and (2) to exercise benevolent hegemony, i.e., to use American power to advance the cause of democratic capitalism throughout the world. As neocons traditionally distrust international organizations like the United Nations, which it sees as dominated by nondemocratic, socialist-leaning, and anti-Israel/U.S. regimes, the United States was to achieve its goals unilaterally and militarily, if necessary. Key to the invasion of Iraq, long envisioned by neoconservative Paul Wolfowitz, was the belief that regime change in that country would lead to a domino effect, democratizing the whole region, making it and the world safer for the United States and its allies, notably, Israel.

This agenda notwithstanding, most neoconservatives left the administration soon after the invasion and turned increasingly critical of Bush's war efforts. They believed that the administration had deployed too few troops, a deficiency primarily blamed on Secretary of Defense Donald Rumsfeld, and they were embittered that Bush was unwilling to act more forcefully against Iran. Moreover, the administration's increasing overtures to the international community were heavily criticized by neocon analysts, as well as by their main remaining ally in the administration, Vice President Cheney.

Neoconservatism and the Right

There is a paradox in neoconservatism's relationship with the larger conservative movement: Although it integrates the main tenets of American conservatism, it is considered to be not truly conservative by many on the right. Many neoconservatives believe that there are two key reasons for the hostile reception they have received within the larger conservative movement: their left-wing origins and their Jewish predominance. Another reason may be their essentially intellectual nature, which breaks with the rather strong anti-intellectual tradition of the American right.

Various conservatives give a more fundamental reason for their aversion to neoconservatism. They claim that neoconservatism is not really conservative. At first this seems a strange claim, given that neoconservatism integrates key aspects of the three tenets of postwar American conservatism (see above). However, the claim is not totally without merit. Most notably, neoconservatives do believe in reshaping society by state involvement, which is visible in their support of a "conservative welfare state" (Kristol), and they believe in enforced democratization and nation building. Their activist foreign policy stands in sharp opposition to the isolationism of at least two tenets of American conservatism, i.e., libertarianism and traditionalist or paleoconservatism.

Neoconservatism Outside the United States

There is no doubt that neoconservatism is a distinctly American movement. However, Irving Kristol's claim of American exceptionalism exaggerates the singularity of the American experience. There are actually neoconservatives outside of the United States, albeit primarily in America's closest allies. However, particularly in the British context, the terms "new conservatism" and "new right" were more prevalent than "neoconservatism," at least for the first generation.

The most important non-American representative of neoconservatism was Margaret Thatcher, Conservative British prime minister from 1979 to 1990, and a close ally of Ronald Reagan. Although not a neoconservative himself, Tony Blair, Labour prime minister from 1997 to 2007, supported much of the second generation's neoconservative foreign-policy agenda and is held in high esteem among American neoconservatives (one of his speeches is even included in *The Neocon Reader*, edited by neoconservative Irwin Stelzer). Outside of Britain, neoconservatism is mostly prominent within the Israeli mainstream right, notably, the Likud Party.

In addition, some non-American neoconservative intellectuals have received particular praise from the U.S. movement. For example, some American neoconservatives consider the French intellectual Jean-François Revel as one of the key founders of neoconservatism. Another relatively influential non-American thinker is the young British journalist Douglas Murray, author of *Neoconservatism: Why We Need It* (2005) and director of the think tank Centre for Social Cohesion, in London.

The Future of Neoconservatism

During the second term of the George W. Bush administration, many neoconservatives jumped ship, both from the administration and from neoconservatism as such. One of the first, and most prominent, defectors was political scientist Francis Fukuyama, whose disappointment with the Iraq War, which he had initially supported, led him to openly denounce neoconservatism and call for a new way. However, his proposed "realistic Wilsonianism" largely resembles the foreign policy of the neocons and differs primarily in means, not goals.

An even more unlikely defector is Richard Perle, Chairman of the Defense Policy Board Advisory Committee under Bush (2001–03), seen by many as a key neoconservative mastermind of the Iraq War. In a 2009 interview with *Vanity Fair*, the “Prince of Darkness” even went so far as to deny the very existence of neoconservatism. Similarly, other prominent neocons have argued that neoconservatism is a creation of the liberal media, and/or the far right, and contains strong anti-Semitic currents. In the words of neoconservative *New York Times* columnist David Brooks: “con is short for ‘conservative’ and neo is short for ‘Jewish’” (Brooks 2004).

Despite the recent obituaries, neoconservatism is far from dead. First of all, neocons were among the key advisors of all major Republican presidential candidates in 2008. Second, they can still rely on a broad and well-funded infrastructure of journals and think tanks. Third, their key values find a growing resonance within the larger American public, as surveys consistently show. That said, the recent Bush administration, and particularly the highly contentious Iraq War, have made the term *neoconservatism* a liability in future political debates. Hence, although the key ideological features will likely remain influential among the American right, they will probably be put forward under new terms, such as Fukuyama’s “realistic Wilsonianism” or William Kristol and Robert Kagan’s “national greatness conservatism.”

Neoliberalism

Neoliberalism

589

593

Neoliberalism

Neoliberalism is a variant of liberalism embracing the concepts of the free market, private property, constitutional order, and the minimal state. As an ideological and political project, neoliberalism became one of the most significant economic movements of the second half of the twentieth century, playing a central role in intellectual and policy discourses in Germany in the 1950s and in Britain and the United States in the 1970s and 1980s. After the collapse of communism in the Soviet Union and Eastern Europe in the early 1990s, neoliberalism came to reign as the “hegemonic” ideology for management of the global economy and construction of a new world order.

Variants of Liberalism

Neoliberalism has its roots in classical liberalism and the antimercantilism disseminated by classical economists such as Adam Smith, Thomas Malthus, and David Ricardo. Smith, in particular, is identified by modern neoliberals as one of the true founders of modern liberalism. His *The Wealth of Nations*, published in 1776, set out the founding principles of the liberal market economy. Smith’s metaphor of the “invisible hand” of the market is treated as a general claim that social well-being is maximized, unintentionally but efficiently, by the countless self-interested daily decisions taken by agents in free markets. These individual interests, Smith asserted, are naturally harmonious; under a system of free competition, the

operation of the market continually tends to produce prices as low as is consistent with supplying the product, while yielding a fair return on the effort expended in production. Wealth and social well-being, Smith argued, are generated through a process of market competition rather than by central governmental direction. Smith accorded the state a limited role in providing “public goods” such as defense and in administering justice. On this reading, Smith’s work represented one of the first attempts to develop an understanding of the principles of self-regulating markets and, as a result, still inspires much neoliberal theorizing on markets today.

The word *neoliberalism* itself was coined in the 1930s by the German economist Alexander Rüstow to distinguish the prevailing state-centered liberal ideas that had become dominant with Keynesianism from those of traditional liberalism. Rüstow’s neoliberalism attempted to provide a new understanding of the state, economy, and society within an ideological framework of traditional liberal tenets. His aim was both to modernize liberalism as an ideology and to meet the economic and political demands of the era—hence, the prefix *neo*. In the years during and immediately after World War II, one of the most influential advocates of these “neoliberal” ideas was the Austrian economist Friedrich von Hayek. The strong antisocialist views of his intellectual mentor and fellow member of the Austrian School, Ludwig von Mises, informed the corpus and ideological direction of Hayek’s work. Hayek’s *The Road to Serfdom*, published in 1944, argued that liberalism in the classical sense of the term had been driven out by socialism, which was irrevocably pushing Western civilization toward totalitarianism. Hayek was writing in a period when the classical liberalism of Smith and Ricardo had been ravaged by a worldwide depression in the 1930s, sandwiched by two world wars that fostered the advance of collectivist ideologies, in particular socialism. Hayek made the controversial claim that all forms of collectivism—even mild forms such as social democracy in postwar Britain—led inexorably toward the kind of National Socialism practiced in Nazi Germany under the Third Reich.

Consequently, Hayek was critical of the Keynesian budgetary techniques and social insurance and welfare programs adopted in Britain and the United States after World War II. He maintained that individual freedom and social progress could be guaranteed only by widespread participation in

market society. He saw the market as a spontaneous order that had naturally evolved without conscious human design. What made the spontaneous market order—or “catallaxy,” as Hayek termed it—superior was that, unlike the modern state, it was capable of coordinating the knowledge of private individuals in society, enabling them to pursue their own short-term objectives while unintentionally promoting the general economic and social good. Hayek saw the state as inefficient and corrupt, damaging the performance of national economies, and infringing on individual liberty.

Hayek did not, however, advocate a system of pure laissez-faire or libertarian capitalism with virtually no state intervention. Hayek’s fundamental concern, like that of his predecessor John Stuart Mill, was to draw up the proper boundaries of the state, whereby intervention was restricted to preventing private force and fraud while not itself becoming unjustifiably coercive. Hayek (1960) identified the proper functions of the neoliberal state as noninterventionist, as being restricted to an individualist minimum sanctioned in his *The Constitution of Liberty*. The state in Hayek’s market order had to be strong, yet minimal. It had to be a constitutional state capable of enforcing property rights, correcting market deficiencies, providing certain public goods, and guaranteeing individual liberty. The principle that determined the legitimacy of governmental activity for Hayek was *Rechtsstaat* (rule-of-law state). The *Rechtsstaat* is an instrument for the regulation of conflicting relations among autonomous individuals in market society. Its function is to secure social cohesion and stability through the preservation of individual liberties.

One of the most significant events in the intellectual development of neoliberalism was the founding of the Mont Pelerin Society (MPS) in 1947. This organization provided an important meeting ground for anticollectivist and “classical” liberal sympathizers. The neoliberals who formed the MPS were not just opposing the rise of socialism in national economies but also responding to the “new” interventionist variants within liberalism itself, such as the New Liberalism advocated by Thomas Hill Green, Leonard Trelawny Hobhouse, and John A. Hobson in Britain, and the liberal progressivism associated with Franklin D. Roosevelt’s New Deal administration in the United States.

The MPS was an international forum advocating the “rebirth of liberalism” in the immediate years after World War II. The initial membership of the MPS by no means consisted only of classical liberals; rather it initially involved a diverse range of individuals who were broadly liberal in their views and who were critical of collectivism, which, they argued, threatened the foundations of civilized society. These intellectuals included Lionel Robbins and Karl Popper from the London School of Economics, the German liberal economist Wilhelm Röpke, and Milton Friedman from the University of Chicago. The origins of neoliberalism as a global ideology can be found in the formation of the MPS. Hayek and other sympathetic “liberals” not only distinguished themselves from other variants of liberalism but also redefined the ideological terrain. Like the Marxists of an earlier time, the Mont Pelerians constructed their own universalist utopia.

Neoliberalism and National Economic Policy

Although the Mont Pelerians made it explicit that it was not their intention to create a new political orthodoxy through the implementation of specific policies, the society’s network became an important source of ideas and inspiration in the construction of national economic policy programs in the postwar world, specifically in Germany, Britain, and the United States. It is against this background that the term “neoliberal” started to be more widely deployed to define a particular ideological stance within the liberal camp.

In Germany in the 1950s, neoliberals, or “ordoliberals” as they were termed, such as Rüstow, Röpke, and Walter Eucken influenced the policy proposals of the early Social Market Economy, which extolled the virtues of free competition, open markets, price stability, control of monopoly, and the enlightened *Rechtsstaat*. The aim of the founders of the German Social Market Economy was not to create an egalitarian system of redistribution but to develop an efficient and successful market economy with a social dimension—a limited safety net for the very poor—through which all individuals would benefit from an increase in the gross national product of the country through competition. After the experience of the Third Reich in power, the ordoliberals made it explicit that the idea of the Social Market Economy did not entail planning any socialist order but rather aimed to link market freedom and efficiency with a compensatory social system, while

retaining a maximum degree of individual freedom. This vision would later influence the New Right in Britain in the 1970s.

In Britain and the United States, the rise of neoliberalism as a policy paradigm in the 1970s was associated with the failure of Keynesian economic management and the onset of stagflation (an inflationary economic situation characterized by a decline in industrial output). Milton Friedman led the attack on Keynesianism, applying a radically free-market ideological stance to a range of public policies. His theory of monetarism rejected the Keynesian “trade off” between inflation and employment, claiming that inflation was a monetary phenomenon that could be controlled only by limiting the money supply according to a fixed rule.

In the 1980s, the governments of Margaret Thatcher in Britain and Ronald Reagan in the United States established the credibility of neoliberalism both as an ideology and as a political program. Neoliberalism became an important ideological component of the New Right. Free-market think tanks such as the Institute of Economic Affairs in Britain and the Hoover Institute in the United States became influential not only in disseminating the neoliberal ideas of Hayek and Friedman but also in turning them into practical policy proposals. Neoliberalism in Britain and America emphasized the need for two institutions: the free economy and the strong state. This combination entailed the introduction of policy prescriptions that were compatible with free-market principles such as monetarism, competition, privatization, deregulation, reduced taxation, and welfare spending, as well as the curbing of trade-union power. Similar policy programs of privatization and deregulation have been adopted in Chile, Slovakia, New Zealand, and even contemporary “communist” China.

The last decades of the twentieth century witnessed a fundamental transformation of the world economy. For neoliberals, the end of communist rule in Eastern Europe and the former Soviet republics in the late 1980s and early 1990s vindicated the primacy of the market and private property. For them the collapse of communism in this region discredited not only the command economy but also milder forms of socialism. Policies to reconstruct capitalism in the developing world under the tutelage of the Washington-based World Bank and International Monetary Fund

institutions constitute what has become popularly known as the “Washington Consensus.”

Globalization and the State

Contemporary globalization of American capitalism, it is argued, has disseminated neoliberalism across the planet. Some critics of neoliberalism contend that the ideology has been imposed throughout the world by powerful global economic institutions like the International Monetary Fund (IMF), the World Bank, and the World Trade Organization (WTO). These critics present neoliberalism as the ideological basis of a global consumer society and the growing inequalities associated with it. Hyperglobalists on both the Left and the Right contend that this neoliberal hegemonic order is reducing the power of nation-states in a global economic system.

However, the status of neoliberalism in relation to the global economy is more complex than this simple rendition. Critical accounts of neoliberalism’s domination of the contemporary global economy overrate its coherence as both an ideology and a policy agenda. At the core of neoliberalism is a significant tension around the role of the state in a market society. Since the original meeting of the MPS, neoliberals have wanted to displace politics and policies associated with collectivism with an economic doctrine of free markets and the rule of law. Achieving this goal has meant rejecting not only nation-states as autonomous decision-making bodies, but also all other regulatory and interventionist agencies, including so-called “neoliberal” global economic institutions such as the IMF, World Bank, and WTO.

However, the spontaneous order of the global market economy envisioned by neoliberals like Hayek cannot be obtained by dismantling the modern state. The notion of a laissez-faire, self-stabilizing global economic system seems anarchic because the market relies on forms of order that it cannot generate by itself. Neoliberalism dictates that sovereign nation-states have a limited but crucial role to play in enforcing law and order, in maintaining property rights and a sound currency, and most significantly, in aiding national integration into the global economy.

Early in the twenty-first century, three main factors threaten neoliberalism's aspiration to maintain itself as a universal ideology and policy agenda for globalization. First, increasing levels of Third World poverty and debt are creating pressures for increased and reformed global governance, rather than the abolition of institutions like the IMF and World Bank. The call is to make these bodies more representative of the nations they serve and more publicly accountable for the decisions they take. Second, neoliberalism faces increasing pressures for global collective action to ensure environmental protection. Any serious attempt to address international environmental concerns, such as global warming and other forms of climate change, could lead to the rejection of neoliberal policy prescriptions at both national and global levels, and the acceptance of interventionist and regulatory measures to restore ecological balance. Finally, the economic crisis of 2008 and 2009 led to a considerable discrediting of neoliberal policy prescriptions. The global recession underlies the fact that markets depend and have always depended on states. At present, however, although neoliberalism may be the subject of intense criticism, no compelling alternative has been proposed. Paul Mason suggests that the world is at a point of "hiatus in history" (2009, 141) while the search for a new economic paradigm takes place.

Conclusion

Neoliberal ideas have strongly shaped the development of the national economies and the global market economy since the 1970s. Along the way, neoliberalism also became the central economic plank of neoconservatism. However, the dominance of neoliberalism has not gone unchallenged, and its influence may wane as new problems come to the fore and attention shifts to the institutional requirements for creating a more economically stable, representative, and sustainable global economy.

Nietzsche, Friedrich

It is hard to overstate the influence of Friedrich Nietzsche (1844–1900) on the political thought and politics of the twentieth century. In part because of Nietzsche's sister's manipulation of his writings after his death, his concepts of the will to power and the *Übermensch*—literally “overman” but often translated as “superman”—were used in support of the ideology of National Socialism for the first half of the twentieth century. Efforts by American and Italian scholars in the 1950s and 1960s to translate and study complete collections of Nietzsche's work introduced a more complex and richer Nietzsche whose work became important to a new generation of diverse theorists. Nietzsche's political thought is important for having effected a break with many of the foundational ideas of modern thought and for thereby leading the way to contemporary or postmodern thought. His major writings include *The Birth of Tragedy* (1872), *Human, All Too Human* (1878–90), *The Gay Science* (1882), *Thus Spoke Zarathustra* (1883–85), *Beyond Good and Evil* (1886), and *The Genealogy of Morals* (1887).

The posthumously published *The Will to Power*, a collection of Nietzsche's unpublished manuscripts, remains controversial as to its representing or misrepresenting his beliefs.

Biography

Nietzsche was born on October 15, 1844, in the small town of Röcken in the Prussian province of Saxony. His parents were Karl Ludwig Nietzsche and Franziska Oehler; his father, a Lutheran minister, died when Nietzsche was five. In his youth, Nietzsche was greatly influenced by the Romantics, including Johann Goethe and Friedrich Hölderlin, as reflected in his earliest autobiographical writings, poems, and musical compositions. He studied classical philology at a private boarding school and at the universities of Bonn and Leipzig, and at 24, because of a very strong recommendation from his professor Friedrich Ritschl, Nietzsche was appointed professor at the University of Basel in Switzerland without having received his doctorate. In 1868, Nietzsche met Richard and Cosima Wagner and began a friendship and collaboration with them that had lasting personal and philosophical importance for Nietzsche. Nietzsche renounced his Prussian citizenship when he began his teaching position, but he served in the Franco-Prussian War in 1870 as a medic. After a few months working with the wounded and dead, he contracted dysentery and diphtheria and returned to Basel after convalescing. Nietzsche had already suffered from serious headaches, and he continued to deal with disabling eye problems, headaches, and illness throughout his life. Because of deteriorating health, Nietzsche resigned from Basel in 1879 with an annual pension.

From approximately 1877 to 1879, Nietzsche struggled with growing disillusionment with his early commitment to the Romantic ideals embodied by Wagner. Nietzsche's disillusionment with Wagner and Romanticism in the 1870s seems to have generated some of his core beliefs, including the rejection of the Romantic notion of the genius and his antifoundationalist understanding of history and values. In 1876, after distancing himself from the Wagners, Nietzsche traveled to Sorrento to stay with friends, Malwida von Meysenbug and Paul Rée. Together they read the French moralists and skeptics Montaigne, La Rochefoucauld, La Bruyere, and Stendhal. The first section of *Human* had already been written, but the second shows the influence of these readings and of Rée's work on a history of moral sentiments, which Nietzsche continued to refer to as late as the writing of *The Genealogy of Morals*. For ten years after his resignation from Basel in 1879, he lived a nomadic and largely solitary life, traveling according to the season to northern Italy, Switzerland, and Germany in search of the right climate for writing despite his deteriorating health.

Nietzsche suffered a severe mental breakdown in 1889 from which he never recovered. After a series of strokes in 1898, he died in 1900 in the care of his sister.

Early Political Thought

Because of his studies in philology, Nietzsche's earliest influences were the Greek classics. Following classical philology's inclination toward humanism, Nietzsche became an atheist in his university years. Like many of the time, Nietzsche became enthralled with the Romantic notion of the genius as the rare individual who is able to express the deep truths of a hidden ideal reality through intuitive, creative, and artistic expression. Wagner, who saw himself as the genius capable of revitalizing German culture through music, encouraged Nietzsche's attraction to Romanticism and the ideas of Arthur Schopenhauer. It was under Wagner's influence that Nietzsche wrote *The Birth of Tragedy*, in which he explored the role of the music of pre-Socratic Greek tragedy in leading people to tap into their intuitive and life-affirming connections to their world.

The Will to Power

Nietzsche formulated his theory of the will in opposition to major aspects of Schopenhauer's philosophy of the will. Schopenhauer's philosophy posited that the human world consists of "the will" or human motivations and drives, which are primarily directed at the desire to live and which bring people into continual conflict with each other. For Schopenhauer, this view meant that the human will should be controlled and suppressed. Only in artistic expression, and particularly in music, could the will be expressed in a way that has any positive value for life. Nietzsche agreed with Schopenhauer's view of the will as constituting the human world, but he disagreed with Schopenhauer that the will must be suppressed to control the conflict that it engenders. Nietzsche rejected Schopenhauer's call for self-denial and self-sacrifice and instead accepted the will as the only truly meaningful element of life. In doing so, Nietzsche believed he was claiming a great "yes" for life. He argued that individuals must embrace life and with it the darker side of the human will. For Nietzsche, this was part of the

exploration of the self, which includes finding and affirming one's innate passions, desires, and abilities.

As Nietzsche's theory developed, his conception of the will shifted from the means to access an ideal cultural reality to an innate desire for power—the “will to power.” Nietzsche believed that individuals were stronger, healthier, and more creative when they accepted the intuitive and animalistic side of human nature. This concept was later used by Nazi thinkers and propagandists to support the idea of a superior race of people, who, according to this interpretation of Nietzsche's work, could justifiably exploit the weak. This use of Nietzsche seems to have been facilitated by a collection of Nietzsche's writings published by his sister under the title *The Will to Power*. This edition has been discredited because she omitted sections that criticized both Christianity and anti-Semitism. Although Nietzsche does use the term “race,” he clearly directed his criticisms very widely, including against the nationalists of the period. Nietzsche's goal was to encourage a life-affirming culture, which necessarily embraces the human will to survive (power) as the individual's way of being in the world.

History, Perspective, and Knowledge

Over the course of his work, Nietzsche developed several theories about the meaning of history. Early in his work, he saw history as something to be studied in order to find examples of the heroic individuals one should emulate. In *Untimely Meditations* (1873–76) and *Human, All Too Human*, however, Nietzsche rejected the idea of a primal, ideal world of unchanging truths for a more sober view of history as composed of the values and language of specific historical contexts. This shift in understanding of history was a part of Nietzsche's shift in thinking about Romanticism and the idea of the inspired genius. Nietzsche came to understand the pursuit of knowledge not as an inspired search by a few rare individuals, but instead as a slow and methodical effort of study, in particular with regard to history.

Nietzsche's theory of history as fundamentally perspectival has influenced contemporary political theory. Nietzsche argued that history is accessible only from individual perspectives and is therefore unknowable in its totality. History thus does not reveal timeless or universal truths, instead

revealing how certain groups of people or cultures have been shaped by the construction of knowledge and values over time. Nietzsche describes this perspective-based knowledge as a *horizon* of the past and future within the grasp of the individual. This conception has both positive and negative aspects; it allows the strong individual to carve out a manageable and life-affirming understanding of history, but it also means that humans are never fully aware of all the influences that have shaped who they are and what they value. It also suggested to Nietzsche, in contrast with Georg Wilhelm Friedrich Hegel, that the history of humankind as a whole has no grand purpose. Instead, history reveals the contingency of human values rather than their deep and lasting truths.

Reevaluation of All Values

As Nietzsche came to posit the contingency of historical knowledge and human values, he turned his focus more thoroughly on the history of morality and on whether dominant moral and metaphysical systems such as Christianity and Kantianism contained any universal validity. He posed the following question: Under what circumstances do humans invent the value judgments of good and evil? In *Beyond Good and Evil* and *A Genealogy of Morals*, Nietzsche argued that the basic concepts of good and evil are originally products of the power of the nobility to claim for themselves the name of good. Later, good and evil are shaped by Judaism and Christianity's claim that the oppressed people are blessed and morally superior. The acceptance of weakness as good is an attack on the human will to power and as such must be exposed as a fateful historical error. Nietzsche wrote that to deny the will results in *ressentiment* (the French term for resentment), which meant for Nietzsche that the individual is consumed by jealousy, weakness, sickness, and a rejection of life. According to Nietzsche, Judaism and Christianity are "slave moralities" of *ressentiment*. The acceptance of one's weakness means that individuals define who they are in relation to negative feelings toward others. The bitterness and jealousy toward others poisons the individual and, as it spreads throughout society, demeans everyone.

In relation to his reevaluation of all values, Nietzsche concerned himself with the consequences for humanity of losing Christianity as the dominant

value system of the West. Nietzsche first proclaimed that “God is dead” in his book *Daybreak*, and this claim becomes central in *Thus Spoke Zarathustra*. The statement suggests that in modernity, Christian beliefs are waning without people’s acknowledging it and without any conscious efforts to reconstruct new moral orders for society. Nietzsche was concerned that, without traditional religions, humanity would descend into nihilism and despair. But Nietzsche did not want to prop up Christianity or any other metaphysical belief wherein humanity is connected to eternal sources of meaning. As an alternative to these beliefs and to nihilism, he urged people to embrace the natural human impulses and desires of the will that compose human lives.

Contemporary Influence

This constellation of ideas about history, the human will, and values has profoundly influenced political thought. Nietzsche’s theory of history and his genealogy of morals were influential for poststructuralism and the work of Michel Foucault and Jacques Derrida. The genealogy of values is a critical tool for many political theorists, including Judith Butler and Wendy Brown. Nietzsche’s view of the individual’s will and his or her passions as the center of meaning in opposition to philosophic systems and traditional religions made him a foundational thinker in existentialism, preceding and influencing other existentialists, including Martin Heidegger, Karl Jaspers, and Jean-Paul Sartre. Nietzsche’s embrace of the individual will has been important for agonistic political thinkers. Agonism affirms the place of conflict in politics, as opposed to the goal of consensus. Those associated with agonism argue that people have fundamental individual differences that should not be suppressed in order to arrive at political decisions, resulting in the acceptance of ongoing conflict. Bonnie Honig, William Connolly, and Chantal Mouffe are among the leading agonistic thinkers.

Nineteenth-Century Political Thought

Nineteenth-Century political thought

596

601

Nineteenth-Century Political Thought

The aftermath of two revolutions, and the enduring impact of a third, shaped political thinking at the beginning of the nineteenth century. Both the American and French revolutions had deeper causes than the economic and political instability that was their spark, lying in ideas that grew during the eighteenth century that increasingly undermined conventional justifications for political authority. The American Revolution, while casting aside the yoke of British imperialism and placing the United States on a path to becoming the world's most powerful democracy, had less of a lasting impact on political thinking than the French Revolution. In France, as the Revolutionaries strived to free themselves from the political institutions of the *ancien régime* and force through a social revolution, they simultaneously bequeathed a rich vocabulary of political concepts that would serve to define political thought in the centuries to come. In a more direct fashion, as the Revolutionary Wars spread the values of *liberté*, *égalité*, and *fraternité* across central Europe, resistance to these ideas also helped crystallize what would become doctrinal positions. As the seating in the National Assembly bequeathed the right-left spectrum to the history of political thought, political ideologies similarly began to define themselves in reaction to the values that were the motor of the Revolution. This, inevitably, was not a case of a single moment of intellectual delineation, but it is nevertheless useful to see the development of political thought in the nineteenth century as an ongoing conversation with the legacies of the French Revolution. Similarly, the third “revolution” that provided the

impetus to political thinking and action during this period, the Industrial Revolution, was a constantly developing issue of concern and interest for political theorists. As the basis of economic wealth in the major powers changed, a host of political positions emerged concerning both the viability and the desirability of industrial capitalism as the dominant system of economic organization. And, as the impact of industrialization on the landscape and the physical and psychological consequences for those at the forefront of industrial production became clearer, the discourse spurred by these issues became more heated.

These three processes of structural change, both political and economic, gave rise to political positions that developed across the nineteenth century and continue to inform political discussion. Most significantly, the emergence of the great ideological families—conservatism, liberalism, and socialism—and the various subschools that surfaced in the wake of these giants, became a discernible feature of the intellectual landscape as the century unfolded. Again, the legacies of the “dual revolution” were not necessarily clear-cut but the product of a constant process of debate and reassessment that gave the cluster of foundational ideas their initial momentum. As the century progressed, new challenges, and new revolutions, would necessitate the revision of these positions, but it was in the nineteenth century that the enduring framework of political labels and concepts was forged.

Conservatism: Questioning the Enlightenment and Revolution

The modern conception of revolution, one that owes so much to the sanguinary path taken in France after 1789, presupposes the existence of those resistant to radical change. As the Revolutionaries dismantled the old order and built a modern state informed by the ethos of the Enlightenment upon its ruins, questioning voices could be heard asking whether too much might be lost in the transition from the old to the new. Even in 1790, before the worst excesses of the Revolution, Edmund Burke (1729–97) had laid the foundations of the critical rejection of the Revolutionary heritage, if not conservatism itself, in his classic work *Reflections on the Revolution in*

France. Although prior to the nineteenth-century hardening of ideological boundaries, Burke's critique of abstract reason as the basis of political action, and emphasis on the value of tradition as a guiding principle in political decision making, exercised an important influence over the subsequent development of conservatism.

Although Burke's professed sympathy for the grievances of the American revolutionists placed him at the more liberal end of the conservatism spectrum, other thinkers rejecting the heritage of the Enlightenment and its manifestation in the French Revolution developed a more austere brand of conservatism. Joseph de Maistre (1753–1821) was a quintessential counterrevolutionary, fleeing France as the Revolutionary Army gained the upper hand, and spending a significant amount of time in the court of Tsar Alexander I. In de Maistre's most important work, *Considérations sur la France* (1796), the French Revolution took on a providential significance, with eighteenth-century rationalist philosophy insidiously undermining the position of Christianity in European society, and thereby the authority of the French monarchy. De Maistre's political theory therefore amounted to a call for a necessary authority to bind the social order, and he viewed the bloodletting of the Terror as a divine punishment for humanity's reckless renunciation of religious authority. Similarly critical of the Revolution's attacks on religion, Louis de Bonald (1754–1840) endeavored to develop the traditionalist critique into a systematic theory, advancing a theory of language seeing god as the ultimate sanction, a position that he carried over into his political thought. For the early French conservatives, the great error of the Revolution was its atheistic intellectual foundation, and its misplaced faith in rationalism as the cornerstone of political action. France also gave the word "conservative" to the political lexicon, with the royalist and Catholic Francois René de Chateaubriand (1768–1848) and Bonald naming their journal *Le Conservateur*. Even outside of France, the regicidal momentum of the Revolution influenced early expressions of conservative political thought. The Russian historian Nikolai Karamzin (1766–1826), for instance, who like Maistre enjoyed the patronage of Alexander I, defended the importance of tradition and urged the Tsar to reign in the political liberalization advocated by his advisor Mikhail Speransky (1772–1839). In Switzerland, Karl Ludwig von Haller (1768–1854), who also buttressed his political arguments with dense historical analysis, similarly rejected the idea

of the state created by the Revolution. Adopting the term “restoration” to describe his political beliefs, Haller looked to the family as the ideal model of political organization, with the monarch in a paternal role.

In the United States, conservatism pursued a different although parallel path. Although the defense of tradition inherent in conservatism posed a problem for a country borne of the rejection of monarchical rule, there was from the outset a vocal demand for a centralized state that could prosper in an age of developing superpowers. This position was captured in the ideas of Alexander Hamilton (1757–1804), co-author of *The Federalist Papers* (1788) and founder of the Federalist Party. Hamilton’s conservatism, despite his sympathy for a strong national government, was expressed in an underlying belief in individual inequality, and a belief that the federalist system would usefully limit the power of the individual, allowing the intellectually superior to rise to positions of significance. Tellingly, Hamilton was plagued by charges of elitism and sympathy for monarchism. The confluence of economic security ensured by protectionism and modernization pursued through governmental means was later taken up by figures like Daniel Webster (1782–1852), who as a member of the Whig Party maintained a distrust for the American people at large and a thoroughgoing elitism. Although the concessions toward centralized government and rampant capitalism complicate placing this conservatism on the political spectrum, in the antebellum South, a more recognizable conservative tradition emerged, which was anxious to defend property rights, paternalism, and hierarchy, the latter manifested in the most hierarchical of economic systems: slavery. Both John Taylor of Caroline (1753–1824) and John Randolph of Roanoke (1773–1833) temporized on the issue of slavery, asserting the primacy of states’ rights, before Southern conservatives George Fitzhugh (1806–81) and John C. Calhoun (1782–1850) advanced an argument of white supremacy to justify its continuance.

The confluence of conservatism, nationalism, and racism toward the end of the nineteenth century often entailed a more magnanimous stance toward the state than the one that informed the conservatism that grew after the French Revolution. On one level, this was a pragmatic reorientation; for thinkers resistant to radical change, the idea of returning to the political forms of old would require a revolution as equally destructive as that of

1789. Consequently, one direction taken by the conservative imagination was a critique of the ascendancy of capitalism and the primacy of the “cash nexus” in social relations, as the Scottish essayist and historian Thomas Carlyle (1795–1881), its most inveterate critic, termed it. Elsewhere, the diffusion of Darwinism at the end of the nineteenth century proved a fillip to those seeing a fundamental inequality between racial groups, a view that Carlyle was not unsympathetic toward. It was the Frenchman Joseph Arthur de Gobineau (1816–82), however, that largely codified this position, producing a four-volume work, *Essai sur L’Inégalité des Races Humaines* (1853–15), that fused a rejection of the democracy on conservative grounds, with an anxiety over racial mixing and degeneration. Maurice Barrés (1862–1923), an active Anti-Dreyfusard, and his colleague Charles Maurras (1868–1952), leading member of *Action Française*, were similarly motivated by a fear of social degeneration that led them to an exclusive nationalism.

Liberalism and the Ambiguities of the Revolution

Liberalism, the political ideology defined by a deep concern over the power of the state, emerged in tandem with the modern centralized state in the aftermath of the French Revolution. Nevertheless, liberalism took a circuitous path in the nineteenth century, and as with conservatism, the legacy of the Revolution was always open to dispute and revision. Like conservatives, liberal thinkers were, in general, profoundly skeptical of the movement toward democracy that began to gather momentum as the century unfolded, but they differed in seeing a preferable hierarchy as one of ability rather than of birth. Although conservatives like de Maistre saw aristocratic society capped by the religiously sanctioned authority of a monarch as the ideal system, liberals, at least toward the middle of the century, held a belief in the potential for every adult male to act responsibly in the political sphere—that is, of course, when their fiscal solvency proved both their capacity for rational decision making and a vested interest in political stability.

The connection with economics is revealing; it points to the fact that although conservatives tended to be anxious about the “cash” relation characteristic of the free market, liberals were more positive about the

civilizing effects of commerce. It is tempting therefore to look for the roots of the liberal ethos in that “dismal science”—Carlyle, again—political economy, and Adam Smith’s (1723–90) belief, expounded in his influential *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776), that the pursuit of individual self-interest could produce general social well-being. Early English liberals like Jeremy Bentham (1748–1832) held a similar faith in the importance of individual self-direction, and Bentham based his utilitarian philosophy, with its famous dictum “the greatest happiness of the greatest number,” on a principle of egoism. The guiding principle of individual action, for Bentham, was the pursuit of pleasure and avoidance of pain, which he combined with an ethical doctrine that the measure of right and wrong was its promotion of general happiness. Institutions, in Bentham’s schema, were charged with providing the environment for human perfectibility, with the state in the role of “night-watchman”—as the liberal position on the state has become known. Bentham’s fame grew in the nineteenth century, mainly under the influence of James Mill (1773–1836), who invested utilitarianism with an austere focus on “interests” over the “wants” emphasized by Benthamism. Hard work, thrift, and self-reliance, the quintessential Victorian values, were placed at the heart of a liberal politics, drawing heavily on an idea of personal character that was familiar currency during the period. James Mill’s son, John Stuart Mill (1806–73), who was to experience firsthand this austerity as the subject of his father’s intense educational experiment, would later temper this aspect of the liberal philosophy in his important *On Liberty* (1859). The younger Mill, also an early advocate of increasing women’s political rights, added a perception of the good life to the utilitarian calculus, stressing the invigorating nature of individual self-assertion, and the “higher” pleasures of aesthetics. *On Liberty* can therefore be read, in part, as a defense of eccentricity, against the moralizing conformity threatened by mass societies.

Liberalism in Britain was clearly a rich political tradition, and perhaps a logical result of the country’s position as the crucible of modern capitalism. But Europe more generally contributed much to the development of liberal thought, and liberalism in turn contributed significantly to political movements around the globe. Benjamin Constant (1767–1830) drew an important distinction in his work *The Liberty of the Ancients Compared*

with that of the Moderns (1819), between a participatory liberty of the ancient city-states and a modern civil liberty, with the individual protected from the overbearing power of the state. In practical terms, Constant argued that a constitutional monarchy on a British model was the surest way of protecting this liberty and reconciled himself to Napoleon's rule. Constant's theory rested on his belief that a constitutional monarchy would act as a moderating influence, overseeing a balance of powers. This ethos of balance was also an important dynamic in American politics, as seen in the first three Articles of the Constitution of the United States. In his lengthy study *Democracy in America* (1835), Alexis de Tocqueville (1805–59) described the vibrancy of American civil life as the result of the pervasive ethic of financial responsibility and accumulation—a process that he believed was tending toward economic equality. Although democratic society had many excellent attributes, Tocqueville cautioned that the individualism nurtured in this system stymied the natural ascension of intellectual authorities, resulting in an undue focus on public opinion. This view, with its admonition that the end of aristocracy did not necessarily mean the end of tyrannical rule, was influential on the younger Mill, with both thinkers adopting the phrase “tyranny of the majority.”

Despite the generally cynical view of the state in liberal political thought, nineteenth-century liberalism was often implicated in the process of state building. The era of liberal nationalism was characterized by a belief in the right to self-determination, albeit for nations enough to be economically viable. These themes were encapsulated in the thought of Italian nationalist Giuseppe Mazzini (1805–72), whose idea of future European political organization was not a multitude of small states united by shared linguistic and cultural ties but a lesser number of large nation-states capable of taking a leading role in world affairs. Liberal nationalism, with its emphasis on active citizenry as the heart of the nation, therefore often appealed to those countries under imperial domination and with a developing and active middle class. The life of the Venezuelan born Simón Bolívar (1783–1830), who led a number of military campaigns against Spanish control in South America, epitomized many of these republican ideals inherited from the experience of the French Revolution. The complex relationship to state power suggested by liberal nationalism was representative of an increasing recognition among certain liberals that the state could be a source of

progress. For the English liberal philosopher Thomas Hill Green (1836–82), deeply influenced by the idealism of Georg Wilhelm Friedrich Hegel (1770–1831), the state was not simply there to prevent conflict but could actively promote the common good, a stance that would inform the subsequent direction of liberalism in Britain.

Socialism: Capitalism and the State

For nineteenth-century socialists, far from ushering in freedom, capitalism had ensnared the great majority in new chains. Although liberals might preach the moralizing impact of trade, and see the individual pursuit of self-interest benefiting all of humankind, socialists tended to view this philosophy as an apologia for the exploitation of those forced to create wealth in the first place. There is a parallel here with the concern characteristic of conservatism, that capitalism had replaced traditional, organic, social relations with an economically motivated relation of self-interest. After all, Karl Marx (1818–83) and Friedrich Engels (1820–95), the most famous socialist theoreticians of the nineteenth century, borrowed Carlyle’s evocative phrase “cash nexus” in their *Manifesto of the Communist Party* (1848). Yet, although conservative thinkers looked to the restitution of monarchy, or the maintenance of aristocratic privilege, as a maintaining link with tradition, socialists tended to view the forces unleashed by the dual revolution as pointing the way to a more encompassing freedom.

For many of the earliest nineteenth-century socialists, the French Revolution served as an example of how not to achieve social change. Balking at the prospect of revolutionary bloodshed, several influential socialist thinkers attempted to theorize a peaceful journey to postcapitalist society—a society based on principles of solidarity, equality, and a life free from toil. Central to this vision was a harmonious life defined by communal living arrangements and shared labor. Robert Owen (1771–1858), who was to play an important role in the development of the cooperative movement in Britain, pursued two important experiments in communal living, at New Lanark, Scotland, and at New Harmony, Indiana. Another powerful influence on the communal movement was the Frenchman Charles Fourier (1772–1837), whose idea of *phalanstères* comprised precisely 1620 people,

the number derived from a doubling of the 810 character types identified by Fourier, inspired a host of communal societies in the United States in the mid-century. For both Owen and Fourier, and Henri Saint-Simon (1760–1825), perhaps the most influential of all in the subsequent development of socialism, the baleful effects of the Industrial Revolution needed addressing. Saint-Simon, rather than looking to communalism, and adopting a less hostile attitude toward capitalist accumulation, looked to a technocracy of scientists and industrialists as the guiding hand that would dispel social strife.

To Marx and Engels, writing in 1848, Owen, Fourier, and Saint-Simon's socialism did not seem to be a durable project. They chided their “utopian” mentality, commenting that their politics, formulated while capitalism was in its infancy, failed to comprehend the nature of class society. The utopians' rejection of violent revolution, explained partly by their historical proximity to the Terror, was also a product of the immaturity of the proletariat, the revolutionary class that Marx and Engels believed would secure communism. The utopians looked on the callow proletariat merely as the most oppressed segment of society rather than an agent of change and preached a doctrine of grand reconciliation instead of revolution. Marx and Engels developed a theoretically rich political thought, drawing insights from the classical economists, Hegelian philosophy, and the French socialism from which they endeavored to distance themselves. Rooting their politics in the supposedly scientific theory of historical materialism, best presented in their posthumously published work *The German Ideology* (1846), Marx and Engels argued that communist society would be borne of the contradictions inherent in capitalist society. Their Hegelianism led to the argument that the contradictions that shape the dynamic of history would reach reconciliation in communism, after the revolutionary activity of the working class secures the social ownership of the means of production. The state for Marx and Engels, while designed to perpetuate class interests in the present and ultimately redundant in the future, could nevertheless serve a useful regulatory function in the transition from capitalism to communism.

Anarchism, an important political force in France, Spain, and areas of Latin America, diverged from Marxism primarily on its relation to the state.

Pierre-Joseph Proudhon (1809–65), the first to declare himself an anarchist, and author of the infamous *What is Property?* (1840), had already earned the rebuke of Marx in his *The Poverty of Philosophy* (1847), which contributed to the developing split between Marxists and anarchists over the best tactics for overcoming capitalism. These divisions became more pronounced after the Russian Michael Bakunin (1814–76) was expelled from the International Workingmen's Association after losing a dispute with Marx over the issue of participation in parliamentary politics. Bakunin, and the anarchists, remained intransigent that any activity in mainstream politics was damaging to the revolution they believed necessary to destroy capitalist society and would blunt the revolutionary consciousness of the workers. On this basis, they looked forward to a revolutionary upheaval initiated through popular action that would displace the overarching authority of the state, and organize social life along communal lines, with individual communes united in a federal structure. Peter Kropotkin (1842–1921), particularly influenced by the ideas of Auguste Comte (1798–1857) and Charles Darwin (1809–82), developed this vision of anarchism, while striving to place his theory of mutual aid on a sound scientific basis. In the United States, where socialism was generally weaker, a distinctive variety of individualistic anarchism developed, associated in particular with Josiah Warren (1798–1874) and Benjamin Tucker (1854–1939), that diverged from Bakunin and Kropotkin's anarchism primarily on the perceived collectivizing consequences of the social ownership of the means of production.

Conclusion

The meaning of the French Revolution was never a settled issue in the nineteenth century, and the persistent debates over its legacy not only informed the construction of the major political ideologies but also their internal negotiations. In a similar fashion, the deep structural and economic changes that began to gather momentum during the nineteenth century had various permutations for the political thought of that century. Conservatism emerged in reaction to this dual revolution, wary of the abstract political reasoning enshrined in the Revolutionary project, and anxious over the destabilizing impact of capitalism's growth. Inevitably, there would be compromise with both the state and capitalism as these institutions became entrenched, perhaps adding credence to Michael Oakeshott's (1901–90)

comment that the best way to think of conservatism is as a “disposition” rather than as an immutable doctrine. Liberalism, the political tradition at the forefront of Europe’s nineteenth-century revolutions, both political and economic, had an ambiguous relationship to the French Revolution, passing from enthusiasm to fear. Welcoming change that would remove, or limit, the power of monarchism, as the Revolution descended into organized violence and political centralization, dissenting voices could be heard. Naturally, the specific national histories of these political traditions are fundamental to their development, but it is helpful to consider the vacillating position on state power in relation to the broad processes set in train by the Revolution. For socialism, an ideology riddled with subtraditions both national and historic, a uniting theme was an opposition to the effects of capitalism. There was debate over the best means of achieving change, meaning that the Revolution’s legacy remained a pressing issue, but socialists were convinced that the freedom offered by capitalism was no freedom at all.

Nozick, Robert

Harvard philosopher Robert Nozick (1938–2002) rose to prominence in the 1970s with his defense of libertarianism and went on to become one of the late twentieth century's most influential thinkers. His major publication in this area—*Anarchy, State, and Utopia* (1974)—was, in part, a response to the egalitarian theory of social justice developed by fellow Harvard political philosopher John Rawls in his *A Theory of Justice* (1971). According to Nozick, the preoccupation with matching distributive outcomes to preconceived patterns, typical of views such as Rawls's, overlooks a set of already existing freedoms and ownership rights. When the state removes goods from an individual (through mechanisms such as taxation), it rides roughshod over those rights and freedoms. As John Locke had argued in his *Second Treatise of Civil Government* (1679), property is already owned and does not fall from heaven like manna, so the notion of distributive justice is not morally neutral; it hides the fact that it is redistributive.

Nozick's view poses a potentially devastating dilemma for views such as Rawls's, which Nozick terms "patterned" principles of justice. Nozick argues that those who wish to maintain a given pattern (equality, or Rawls's difference principle, for example) must either mandate massive infractions of liberty by prohibiting individuals from engaging in simple exchanges of goods or accept the fact that liberty upsets patterns and will likely lead to significant inequalities in wealth and property. Nozick's well-known imaginary example of Wilt Chamberlain, the basketball player, who demands an extra 25 cents on the price of each ticket to see him play (in

return for enjoying the exercise of his extraordinary talents) illustrates the dilemma: The state either prevents citizens from spending a mere 25 cents of their money as they wish (prohibiting capitalist acts between consenting adults) or accepts the unsustainability of any baseline egalitarian distribution.

At the root of Nozick's view is a commitment to a Kantian notion of autonomy—that individuals should be treated as ends, not merely as means—and that the rights of ownership and liberties that flow from this assumption are of greater importance than the state's claim to redistribution. Nozick thus argues that justice should be concerned with the historical development of a given distribution. As long as no coercion, fraud, or theft has occurred in the process of transferring goods, and those goods were legitimately owned in the first place, then a distribution is just. In this, Nozick's view explicitly follows that of John Locke by expanding on the labor-mixing theory of ownership, whereby previously unowned property can come to be owned via an individual's working on it (mixing her labor with it).

The only legitimate state becomes a minimal one—one that protects the system of contracts that underpins the market (the free exchange of goods and services) and rectifies any illegitimate transfers. The illegitimacy of redistributive mechanisms means that the state must have no role in the provision of public goods and services such as healthcare, education, welfare benefits, local amenities, and public transport. All such goods would have to be provided for by voluntary private schemes.

Nozick's libertarian political philosophy has inspired myriad critical responses, including book-length treatment by analytical Marxism's leading proponent, G. A. Cohen, in *Self-Ownership, Freedom, and Equality* (1995). Nozick's treatment of distributive justice often overshadows other important aspects of *Anarchy, State and Utopia*, including his critical treatment of average utilitarianism via the "utility monster" example, and his hypothetical "Experience Machine." The latter imagines a machine capable of perfectly simulating (by acting directly on the brain) the pleasure of any experience chosen by the user. Users could select a life-long program that included their greatest desires—writing the great American novel,

scaling Everest—and they would get these great experiences *as if* they were real. The aim of the example is to illustrate that there is more to a valuable life than simply the internal picture of pleasure to the individual. Here Nozick seeks to overturn the familiar position (often associated with utilitarianism) of hedonism—which reduces value to the pleasure it brings to the individual—by asking whether we would really see no difference between reality and a perfect simulation if they both created equal amounts of pleasure.

Nozick has made significant contributions to other areas of philosophy, including epistemology, free will and determinism, and the nature of identity, in his *Philosophical Explanations* (1981); a major contribution to decision theory, including a seminal analysis of Newcomb's problem, in *The Nature of Rationality* (1993); and in *The Examined Life* (1989), which addresses a broader range of life's puzzles, such as faith, death, love, and the meaning of life.

604

Nyerere, Julius

Julius Kambarage Nyerere (1922–99) was born on April 13, 1922, in what was then British-controlled Tanganika, East Africa. His primary education began in his village and progressed to a university degree at Makerere in Kampala, Uganda. The next stop was Scotland, where he earned a graduate degree in economics and history from the University of Edinburgh. His political career began in the 1950s as the founder and leader of the Tanganika African National Union (TANU). He was elected President in 1962. In 1964, he brokered a union between Tanganika and the independent island of Zanzibar that created the United Republic of Tanzania. He remained the head of state of Tanzania until 1985, when he became the first contemporary African leader to step down voluntarily from his position of power. He was to become the foremost proponent of one theory of African socialism. His brief tenure as a teacher in a high school near Dar es Salaam earned him the affectionate title of *Mwalimu*, the Kiswahili word for teacher.

Nyerere had quite a bit to “teach” his people about the need to preserve their traditional way of life. His writings are extensive. He called his political theory *Ujamaa* in a pamphlet published in 1962. This Kiswahili word meaning “familyhood” was the basis of his ideas regarding African socialism. To Nyerere, his people needed only to regain their former attitude of mind by reeducating themselves in the ways of their ancestors.

Nyerere declared that socialism could be considered a part of this “attitude of mind.” He understood socialism primarily in terms of a fundamental equality of persons that exists only in the absence of exploitation and the flowering of a type of democracy that had been a staple of African village life. African peoples had no need to be converted to Western notions of socialism steeped in a history of class struggle and organized opposition. The practice of “sitting under a tree” and “talking till you agree” was the foundation of African socialism and democracy. Democracy was fundamentally rule by the people rather than by tyrants. In situations where the people had voted overwhelmingly for the political party that opposed the continuation of foreign domination, this act legitimized a single-party system. As long as there were choices between candidates and free discussion of issues, Nyerere believed, there was no need for another political party in this early stage of decolonization. In 1966, for example, three fourths of the TANU-nominated candidates were defeated by independent opponents.

The Cold War framed the existing theoretical debate and pressured the emerging African nations to choose between the Eastern and Western European ideologies of communism and capitalism. But Nyerere saw the issue primarily in moral terms. Using noncentralized African communities as his model, he argued that this form of gerontocracy was superior because the elders did not own the wealth produced by society but were merely its guardians. The land itself belonged to the community and was distributed in a manner in which each family had access to a portion of it. In this way, a right to life was guaranteed because one had a means of maintaining life.

The communal basis of society ensured an even distribution of wealth with an obligation for everyone to work. A fully functioning member of society would be ashamed to remain idle. Even hospitality had its limits. The elders had worked hard all of their younger days. This mutual involvement with one another made it possible for all to depend on the wealth possessed by the community of which they were members. No one would starve from lack of food or suffer from lack of human dignity. Persons need not worry about what might happen to them tomorrow if they did not hoard wealth today. Society would look out not only for male providers but for widows and orphans as well.

According to Nyerere, compensation for labor must be fairly distributed in proportion to the wealth or poverty of the whole society. The attitude of a capitalist who argues that a rich man's wealth is reward for his superior skills and enterprise is flatly rejected by Nyerere. Hardship as well as prosperity would be shared among the population. Natural disaster might bring famine, but it would bring famine spread out evenly over all.

Nyerere believed that these principles were embedded in Africa's intellectual, social, and economic history. He proposed a blueprint for implementing them. He would collectivize agriculture and establish *ujamaa* villages in which farming communities would live, work, and harvest together, providing for help and security for all who needed it. Productivity would rise, and a rational division of labor would emerge. Government's role in bringing this nation of villages into existence would be based on persuasion, not force. In addition, Nyerere's government also nationalized key sectors of the economy.

As a foundational measure to ensure the success of his utopian vision, Nyerere implemented a set of far-reaching educational reforms. The mission of Tanzania's educational system should be to inculcate socialist values; a pride in African history, culture, and language; an ethic of service in its students; and self-reliance. The curriculum was changed to reflect these new goals. Schools were to be administered so as to become communities that embodied the principle of self-reliance. Students would contribute to their own upkeep.

Ultimately, the nation as a whole needed to become self-reliant. Nyerere used this principle to argue for Tanzanian economic and social-development policies with autonomy from international capitalist institutions. Tanzania had to choose a path to development that did not depend on aid but on the labor of its own people. The Arusha Declaration, drafted by Nyerere and amended and accepted by TANU in 1967, clarified the implementation of these ideas of socialism and self-reliance.

Nyerere's vision was of a united Africa working together for the good of all African peoples. As a committed Pan-Africanist, he mobilized support especially in east and southern Africa for the complete independence of the continent from colonial domination. His role as leader of the Frontline

States positioned him to spearhead support for the elimination of the apartheid regime in South Africa.

Nyerere's death in 1999 became an occasion for the reevaluation of his political theory of *Ujamaa*, African socialism. Although there was a general consensus on the inadequacy of Nyerere's economic policies, many commentators focused on the successes of Nyerere's leadership. Nyerere's implementation of one-party rule could be seen as an original effort to promote democracy and political participation. It is noteworthy that Tanzania was able to transition peacefully into a multiparty system. Nyerere has been praised for bringing unity to a nation with 156 tribes and multiple ethnicities, languages, and religions on a continent that is besieged by divisions that have erupted into armed conflict.

Colin Legum argues that if Tanzania's progress were to be judged by the Quality of Life Index rather than by its gross national product, its progress has been impressive. Rates of infant mortality and life expectancy, along with levels of literacy and the supply of fresh water, all increased dramatically as a result of Nyerere's policies in health and education. Some of the economic setbacks experienced in Tanzania can be attributed to the impact of the rise in oil prices after 1973 and long periods of drought, rather than a failure of his ideas. In terms of theory, he laid out a clear road map with a moral compass.

Most importantly, the *Mwalimu* practiced what he preached. His personal integrity was not questioned. He was known for not succumbing to the temptations of power but for leading a life of austerity, hard work, and humility. Unlike many other African leaders, his dedication to the ideals of a socialist society was exemplary. Although these ideals could be found in Africa's extended family structure, Nyerere understood them in universal terms. He argued that the responsibilities to care for one another must be extended beyond the tribe, community, nation, and continent to all of humanity.

606

Oakeshott, Michael

Michael Oakeshott (1901–90) was one of the major political philosophers of the twentieth century. Since his death, there has been a tremendous growth of scholarly interest in and exploration of his work, which has shown him to be more complex and multifaceted than was appreciated during his lifetime. He studied history at Cambridge, where he remained a university lecturer in history until the end of the 1940s. He volunteered for World War II, where he served in British intelligence but also on the front lines. After a brief time at Oxford after the war, he became a professor of political science at the London School of Economics in 1951, which his father (who was a Fabian socialist) had helped found. He preserved his tie with the school long after his retirement in 1967 and continued until the 1980s to participate actively in the famous graduate seminar in the history of political thought that he had founded.

Oakeshott's work has been both academically and more broadly culturally appropriated under three different rubrics that do not often coexist: conservatism, postmodernism, and liberalism. He has made important and distinctive contributions to all three areas of theorizing. Oakeshott believed that all varieties of modern politics from the extreme right to the extreme left manifested a common tendency toward rationalism. According to Oakeshott, the rationalist is simultaneously committed to gnosticism (that a privileged and specially trained elite is privy to secret knowledge of the whole that forms one's field of judgment), the primacy of ideology over theory, and the need and the possibility of attaining certainty. To the

collective personality of the rationalist, Oakeshott counterposes one who sees politics as “the pursuit of intimations” of the steps and missteps of the past and who undertakes piecemeal corrections and redirections of earlier initiatives. Notions such as tacit knowledge, tradition, custom, habit, and the primacy of the irrational over the rational in human nature play a much larger role in the conduct and structure of politics than the rationalist is capable of acknowledging.

Oakeshott’s contribution to postmodernist theorizing consists of his steadfast adherence from his earlier to his later writings to the notion that there is no absolute distinction between a fact and a theory. A fact is merely a theory that one is not willing or able at any given moment in time to probe or interrogate any further. All of our knowledge comes freighted with presuppositions that cannot be unpacked or resolved without engendering further presuppositions. Oakeshott considered the role of philosophy to be to diagnose what he called the “conditionalities” (the particular assumptions and theoretical commitments) that colored the different regions, or what he referred to as the “modes” of experience. For Oakeshott, the chief modes of experience were practice, science, and history, and he later came to add poetry or aesthetic experience. Since philosophy cannot disclose to us anything new about the world or particular regions of experience within it, Oakeshott in his later writings drew an analogy with the activity of engaging in a conversation: In a conversation, there are no secure starting points or termination points. One can begin and leave off virtually anywhere. What is precisely underscored in conversation is the “conditionality” of all starting points and the consequent inconclusiveness of what are taken to be end points.

Oakeshott’s contributions to liberal theory exemplify the same tendencies of thought that are manifested in his conservatism and postmodernism. Oakeshott favors those types of state that pattern themselves on the ideal of what he calls *societas*, whose mode of relationship is formal in terms of rules and is highly critical of modern states that assimilate themselves to the model of “enterprise associations” pursuing the goals of what he calls *universitas*, whose principle of association is a common substantive purpose. In his embrace of *societas* over *universitas*, Oakeshott advocates for a sheerly formal, instrumentalized relationship subsisting between the

public and the private sphere, with the major focus of human activity centering on the private sphere. There seems to be a clear line in Oakeshott connecting his mistrust of reason expressed in his antipathy toward rationalism in politics and his epistemological critique of the possibility of certainty with his ideal-typological characterization of the liberal state as one preoccupied with the legislation and enforcement of formal rules.

Obedience, Political

“Obedience,” Jonathan Edwards declared, “is the submitting and yielding of the will of one, to the will of another” ([1754] 2009, 152). Although appearing in a religious treatise on moral agency, Edwards’s statement reveals the essence of political obedience as it was understood in the eighteenth century. Political obedience entails a sovereign making laws and issuing commands to his or her subjects, who signal their compliance by aligning their choices and actions with those laws and commands. Subjects obey because they are morally bound to obey and because they fear the perils and punishments awaiting their disobedience. A meeting ground of freedom and necessity, political obedience is an act of volition by one moral agent, the subject, with regard to another, the sovereign.

It is also an unexpected achievement. After centuries of warfare over the legitimacy and extent of a subject’s right to refuse or resist the sovereign, few theorists before the French Revolution took political obedience for granted. Subjects are unruly, and states are weak; that is the backdrop to the discourse of obedience prior to the nineteenth century, explaining why theorists from Thomas Hobbes to Jean-Jacques Rousseau must go to such lengths to establish the sovereign’s right to govern and the subject’s duty to obey.

In the nineteenth century, however, that tradition changes. Political obedience comes to be seen as a millstone rather than as a challenge. Authority has grown too potent—“my greatest complaint against

democratic government,” writes Alexis de Tocqueville, “is not . . . its weakness, but rather its irresistible strength” (1969, 252)—and the individual too compliant. “The danger which threatens human nature,” writes John Stuart Mill, “is not the excess, but the deficiency, of personal impulses and preferences” (1989, 61). Once there was not enough obedience; now there is too much.

Three transformations underlie this shift. First, political theorists came to believe that democracy had overwhelmed the skepticism that once inspired rebellion. When kings or aristocrats ruled, people were cool, if not hostile, to government. They sought to limit its power. But now that they are in charge, went the argument, they seek to make government more powerful, more able to implement their will.

Second, theorists began seeing authority as having migrated from the state to society. Where governments previously had a monopoly on power, the argument went, power is now shared with—indeed, is wielded by—the forces of society. Those forces, particularly public opinion, are less violent than the state but more coercive. Their presence is nearer, their weight more felt. “The discontent of the multitude,” wrote Ralph Waldo Emerson, is “more formidable than that of the senate” (1990, 34). They are less visible—one cannot, in society, identify the discrete outline of the governor, the silhouette of the jailer—but more insidious. They penetrate the outer perimeters of the self and take up residence inside; there, they tailor the individual’s beliefs, tastes, and desires to fit the fashions of the public.

Last, the individual came to be seen less as an agent and more as an automaton. Long before the deconstructionist and dystopian literatures of the twentieth century, nineteenth-century theorists speak of the social construction—and hence destruction—of the self. The forces of society are so powerful that the self gives way before them; after a time, no self remains to give way. “By dint of not following their own nature,” Mill writes, men no longer have a “nature to follow” (1989, 62). “Under all these screens” of social influence, says Emerson, “I have difficulty to detect the precise man you are” (1990, 33). With the self, the necessary ground of all volition and obedience, unable to bear the weight of its own existence, it

makes less sense, to the nineteenth-century theorist, to speak well or even meaningfully of obedience.

Seen in this light, two emblematic accounts of political obedience in the twentieth century appear almost as afterthoughts. Although formally addressed to the depredations of Nazism and Stalinism and the soft despotism of the modern state, respectively, Hannah Arendt's *The Origins of Totalitarianism* (1951) and Michel Foucault's *Discipline and Punish* (1977) disclose less the realities of obedience in the twentieth century than the influence on the theorist of the idioms of the nineteenth. The evil of the camps, argues Arendt, is that they turn men into "marionettes," into "bundles of reactions" that can "no longer be psychologically understood." Such men neither obey nor disobey; they "behave," going to their deaths with nary a word or protest (Arendt 1951, 438, 441, 456, 458).

Foucault's carceral society is supposed to offer more space for resistance. But the would-be agent of that resistance, the self, is "the effect and instrument of" that society. The self is not "amputated, repressed, altered by our social order." It is "fabricated in it." The would-be object of resistance, the sovereign, is dispersed throughout a "universally widespread panopticism." With power no longer "localized in the relationships between the state and its citizens"—both having been dissolved, at least in theory, long ago—it is no longer fruitful to speak naively of obedience and disobedience (Foucault 1977, 27, 30, 217, 223).

In everyday life, of course, obedience and disobedience continue their perpetual dialectic, from China to Wall Street to North Africa, although with arguably more tenuous combatants.

609

Orwell, George

George Orwell was born Eric Arthur Blair in Motihari, India, in 1903. He came to Britain with his mother as a child and had a conventional education for a boy of what he described as the upper/lower middle class. He won a scholarship to Eton where, although he failed as a scholar, he read widely, including the entire output of George Bernard Shaw and H. G. Wells, who were profoundly to affect his intellectual development. Unsurprisingly, given his background, Orwell joined the Imperial Police soon after leaving Eton in 1922 and served in Burma. He became thoroughly disillusioned with the “business” of empire, and when he returned on sick leave in 1927, he resigned his commission.

Having decided to fulfill his life’s ambition and become a writer, Orwell set out to discover a world about which to write. His imperial experiences left him with a need to identify with the powerless, and he spent months working as a scullion in Paris and living as a tramp around London. His writing on poverty (especially *Down and Out in Paris and London*, 1935) drew him to the attention of Victor Gollancz, publisher of the Left Book Club, who commissioned him to write about unemployment and poverty in the North of England. Expecting to confront only misery, Orwell found himself impressed by the resilience of the northern working class, with its values founded on egalitarianism, community, and common decency. He claimed these values represented democratic socialism “when all the nonsense is stripped off” (Orwell 1937, ch. 13). Orwell’s experiences were chronicled in *The Road to Wigan Pier* (1937), which Gollancz published

reluctantly since in part it constituted a savage attack on the left-wing intelligentsia.

Soon Orwell was on his way to the Spanish civil war, ostensibly as a war correspondent but realistically to fight “against fascism and for common decency” (Orwell 1938, ch. 5). He served on the Aragon front with the Trotskyite militia Workers’ Party of Marxist Unification (POUM), and he was wounded nearly fatally. He discovered that the communists, under the influence of their Russian backers, were intent on the destruction of their more revolutionary allies and that his own life was in real danger. What he saw as communist treachery against fellow socialists became the prime motive for much of Orwell’s subsequent writing (for example, *Homage to Catalonia*, 1938). He set about to expose Russian communism as the enemy of democratic socialism. His two greatest works, *Animal Farm* (1945) and *Nineteen Eighty-Four* (1949), earned him a lasting reputation as one of the fiercest of the Cold Warriors. His health had never been good. He had picked up dengue fever in Burma and suffered with his chest over the years, eventually developing the tuberculosis that killed him in 1950. Typing the final draft of *Nineteen Eighty-Four* on the remote island of Jura the previous winter had shortened his life. He believed the sacrifice was necessary.

Orwell is largely remembered for what he stood *against*, although even this is misunderstood. He acquired a hatred of Stalinist Russia, and *Animal Farm* is a brilliant parody of the Russian Revolution. *Nineteen Eighty-Four*, however, was not intended to be specifically anti-Soviet but rather antitotalitarian, and Orwell believed that totalitarianism posed a threat to all modern states. This is why Winston Smith is a citizen of Oceania (the Western world) and more precisely of Airstrip One (even liberal Britain was at risk). Orwell also awakened us specifically to the systematic, politically inspired abuse of language by leaders in modern states.

But what was he *for*? Because he abstemiously avoided ideology, which inevitably empowered the intelligentsia, Orwell never produced a convincing program of his democratic socialism based on the elusive concepts of common decency, community, or equality. Yet at its heart was the belief that if ordinary people remained loyal to each other and not to

ideas or institutions, if working-class community values survived, and if these values and culture remained embedded in ordinary language, hope for building a moral and political system strong enough to combat totalitarianism remained.

What Orwell bequeathed to humanity was a few books, including two that helped to shape the postwar world, and a substantial number of incisive essays, articles, and reviews on political and cultural themes. Orwell was too inconsistent to be considered a major political thinker, but he was a master of prose. His portrayal of the propensity of modern technocratic centralized states (or institutions) to destroy ordinary human values and language remains unequalled.

Owen, Robert

Owen, Robert

609

610

Owen, Robert

Robert Owen (1771–1858) had a remarkable career as an entrepreneur turned social reformer. Born in Newtown, mid-Wales, he rose from linen draper's apprentice via drapery stores, machine building, and mill management to become, by 1800, manager of New Lanark, Scotland, one of the largest cotton mills of the time. The mill had been established by his father-in-law, David Dale, whose regime was in part philanthropic and aimed at improving the living and working conditions of his employees. Owen also instituted workplace and community reforms, raising productivity and profits but also enhancing welfare and educational provision.

He used the community as a test bed for Enlightenment ideas, producing essays on *A New View of Society* (1813–14) designed to promote social regeneration in the aftermath of the Napoleonic wars. In 1817, he announced a plan for village communities modeled on New Lanark to overcome the economic crisis. His thinking also moved progressively from competition toward co-operation, which would underpin the new communities.

Although the problem of the poor was a continuing concern, he also promoted factory reform, which was slowly ameliorated by later Factory Acts. Popular education also remained a prime objective both in his model communities and beyond. In 1818, he carried the message of his "New

System” to several European capitals and to the Congress of Sovereigns meeting at Aix-la-Chapelle.

In 1820, he produced his most important economic statement, the *Report to the County of Lanark*, and stood unsuccessfully for Parliament. Despite aristocratic support, he failed to persuade Parliament to act on his recommendations and his attempts in Ireland in 1822–23 were also abortive. Disillusioned, he abandoned Britain for the United States, where in 1825, he purchased New Harmony, a ready-made community on the Indiana frontier. Here he tried a “Community of Equality” (1825–27) and, when it failed, made another unsuccessful effort in Mexico (1829).

Returning to Britain, he associated with working-class movements, including labor exchanges, consumer co-operatives, and trade unions. With John Doherty, he led the short-lived Grand National Consolidated Trade Union (1832–34) also editing the *Crisis*, an Owenite periodical. He continued to promote his ideas through Owenite organizations and another community experiment at Queenwood, Hampshire (1839–45). By this time, Owen had become “Social Father” to Owenism, a position he occupied until his death in 1858. His followers eventually drifted into other reformist organizations.

Although Owen’s ideas did not fit the political agenda of the time, they proved resilient and of longer term influence, notably, those concerned with education and citizenship, gender, welfare, co-operation, environment, and sustainability.

Life-long education was the key to much of Owen’s thinking. If the character formation signaled in his essays was to work, it must extend from infancy, hence, the attention devoted to early education at New Lanark. Owen’s interest embraced all ages, delivering a progressive curriculum with innovative teaching methods partly derived from Johann Heinrich Pestalozzi. Evening schools and uplifting lectures that typified Owenite communities were also linked to his citizenship agenda, which emphasized social responsibility, communal action, care for the environment, and so far as it went, democratic participation in government.

His educational objectives also fed into gender issues. The schools were open to girls and boys equally. Owen promoted equality and called for the reform of marriage and the marriage property laws. He favored birth control as a means of liberating women.

Owen is regarded as a significant pioneer of welfarism, which found expression at New Lanark in environmental improvements, better housing, education, medical care, and social benefits in sickness and old age.

Although this was later implemented by other philanthropic employers and promoted by workers' organizations, Owen's comprehensive system, albeit linked to education, was undoubtedly pioneering and influential.

Owen's vision of co-operation began with the attack on poverty, which would be alleviated because community members would not compete but contribute to the common wealth. Although the arrangements about labor values, shares, and rewards were confused, Owen saw the communities resembling modern public-private partnerships with members ultimately becoming shareholder owners. Other Owenite organizations had a strong co-operative ethos, though the links to consumer co-operatives, while widely celebrated, are more tenuous.

Finally, there are strong environmental messages about the use of natural and human resources in Owen's agenda. He was able to balance commercial success as a mill owner with principles of welfare, education, and housing and broader environmental concerns, harnessing power and natural resources not only to make money but also to benefit workers and the community.

Although this could be seen as mere corporate philanthropy, Owen promoted an alternative view to the dominant ideology of laissez-faire that was of considerable long-term significance. It influenced developments in industrial relations, education, welfare, and co-operation, and many reform issues later embraced by the Liberal and Labour parties in Britain and by social democrats in the United States and Europe. Owen's ideas on education, citizenship, welfare, and sustainability, revisited in recent scholarship, certainly remain highly relevant in modern democracies.

Pacifism

Pacifism

611

612

Pacifism

The word *pacifism* normally means opposition to all war, indeed all intentional killing of human beings. Although opposition to war is ancient, the word “pacifism” was coined in 1901 (Cortright 2008, 8).

There are many varieties of pacifism: religious and secular as well as passive and activist. American Mennonite theologian John Howard Yoder distinguished 18 varieties of religious pacifism in *Nevertheless* (1971). Others, such as American political scientist Gene Sharp, promote nonviolent alternatives on purely secular, pragmatic grounds. Because, for so many, the word “pacifist” has acquired passive connotations of acquiescence to injustice, many contemporary pacifists prefer to speak of activist nonviolence or nonviolent direct action.

Within all major world religions—Buddhism, Hinduism, Islam, Judaism, Christianity—a pacifist tradition has emerged. Almost always, however, the pacifist community has been a minority voice within its own religious tradition. The history of Christianity illustrates this pattern.

For the first 300 years, Christian writings were largely pacifist. There are a number of references to war and killing in extant Christian writings from these early centuries, and almost unanimously they say that Christians must never kill another person. Repeatedly they base this belief on Jesus’s command to love one’s enemies.

There is evidence, however, that by the third century, there were increasing numbers of Christians in the Roman army, although the historical evidence is too incomplete for historians to know the numbers with any precision. In the early fourth century, the Emperor Constantine embraced Christianity, and by the end of that century, the great North African theologian, Augustine, bishop of Hippo, had begun to articulate what came to be called the just war doctrine. Under limited circumstances when certain criteria are met, it is right for Christians to fight wars for peace and justice. Since the fourth century, this just war position has been the majority Christian view.

Throughout the centuries, to be sure, a minority Christian pacifist voice arose. During the sixteenth-century Reformation in Europe, fairly large numbers of Anabaptists (later divided among Hutterites, Mennonites, and Amish) embraced pacifism, and some were executed by both Catholic and Protestant rulers. In the seventeenth century, another emerging Christian group called the Quakers embraced pacifism. By the early twentieth century, a number of smaller Christian pacifist bodies had emerged.

After World War I, a significant number of theologically liberal Protestants abandoned their just war tradition and became pacifists. That movement provoked a stinging rebuke from Reinhold Niebuhr, the most distinguished Christian political theologian of the mid-twentieth century. Denouncing this theologically liberal pacifism as grounded in a naïve view of human nature as basically good rather than distorted by selfishness, Niebuhr's 1940 essay "Why the Christian Church Is Not Pacifist" checked this rising pacifism and helped prepare for the American entry into the battle against Adolf Hitler.

In the last 50-plus years, pacifism has slowly gained some strength. One significant reason is the emergence of an activist pacifism that achieved stunning success in the nonviolent campaigns of Mahatma Gandhi and Martin Luther King, Jr.

Gandhi, a Hindu pacifist, led the successful struggle for Indian independence against British colonial rule. His successful nonviolent struggle against Britain led to the death of only 1 in every 400,000 Indians, whereas Algeria's violent overthrow of French colonialism resulted in the death of one in every ten Algerians. In the United States, Martin Luther King, Jr. led a nonviolent civil-rights campaign that overturned racist

structures and changed American society. Gandhi and King are the most visible practitioners of this new activist nonviolence, but numerous lesser known nonviolent campaigns overthrew dictators. Then, toward the end of the twentieth century, a largely spontaneous nonviolent uprising brought down President Ferdinand Marcos, who had ruled the Philippines for decades as a vicious dictator; and Solidarity, an independent union and resistance movement in communist Poland, used activist nonviolence to bring down Poland's communist government and contribute to the collapse of communism in Eastern Europe and the Soviet Union.

Meanwhile, in academic theological circles in the United States, pacifism was regaining a serious hearing. Yoder's *Politics of Jesus* (1972) was read widely and exercised substantial influence in Catholic, mainline Protestant, and evangelical Protestant circles as well as in Yoder's own Mennonite community. Yoder's influence contributed to the embrace of pacifism by Methodist Stanley Hauerwas, one of the most prominent of the ethicists and theologians writing today in the United States. Increasing numbers of Catholics have become pacifists, although the just war tradition still dominates both Catholic and Protestant circles.

Also significant is the emergence of a third stance, "just peacemaking," articulated especially by Glen Stassen, a Baptist and professor of ethics at Fuller Theological Seminary. Without trying to settle the long argument between pacifists and just war advocates, just peacemaking brings both groups together to advocate concrete, nonviolent steps toward peace.

Pacifists exercise very little influence on American politics and foreign policy. Often, they join just war adherents to oppose specific wars or military expenditures. The campaign for a World Peace Tax Fund (which would allow taxpayers to direct that portion of their taxes that would otherwise fund military expenditures to this peace fund) has attracted only a small, albeit slowly growing, number of co-sponsors. Pacifism remains a small minority voice in American religious and public life.

Paine, Thomas

Paine, Thomas

612

614

Paine, Thomas

Thomas Paine's major contributions are to the theory of representative government, the justification of welfare provision and a basic income, the development of the concept of natural rights, and the spread of popular deism in the nineteenth century.

Thomas Paine (1737–1809) was born to a family of moderate means in Norfolk, England, and led a checkered life with little achievement until he emigrated to America in 1774. Within two years, his *Common Sense* (1776) made him the most influential pamphleteer of the American Revolution. Written in a direct and lively style, it denounced the decaying despotisms of Europe and pilloried hereditary monarchy as an absurdity; in contrast, America was presented as the natural resting place for freedom and as a country in which the law is king. At a time when many still hoped for reconciliation with Britain, *Common Sense* touted the inevitability of separation.

Paine consolidated his reputation as a pamphleteer with his series of *American Crisis* letters (1777–83); he also served in a number of capacities for Congress and the Pennsylvanian Assembly. In the early, dark hours of the American Revolution, General George Washington had Paine's *The American Crisis* (1777) read to his desperate troops to rally their spirits. After the Revolution Paine dedicated his time to scientific experiments, designing an iron bridge capable of spanning wide distances without the use of piers. In 1787 he took his model to Paris, where he became caught up in

the initial events of the French Revolution and was later arrested for his efforts. When Edmund Burke's *Reflections on the Revolution in France* (1790) appeared, Paine determined to answer it. *Rights of Man* (1791–92) couples a narrative of French events with a trenchant attack on Burke and the Revolution Settlement of 1688. Distinguishing between natural rights for which our power to exercise them is perfect (freedom of conscience), and those for which it is imperfect so that we need government to enforce them (property), Paine argues that there are many areas in which government has no proper authority. Its only role is to support people's rights. Against Burke, he argues that no generation has the right to alienate the rights of later generations; rather, each generation has the right to determine for itself the form its government will take.

Visiting Paris in June 1791, in the immediate aftermath of Louis XVI's flight to Varennes, Paine jettisoned the tolerance for France's limited monarchy that had earlier that year marked his text. By contrast, the second part to *Rights of Man* (1792) is explicitly republican. It draws on his American experience to sketch the basic principles of a largely self-regulating commercial society, coupled with representative government, the rule of law, and a periodically renewable covenant. The final chapter, influenced by his friendship with Condorcet and other members of the Comité de Mendicité, outlines a program for a welfare state.

Combined, the two parts of *Rights of Man* sold in unprecedented numbers. Paine's reliance on natural rights, his attacks on mixed government, and his republicanism set him apart from the British opposition's political rhetoric and the emphasis on English liberties. His popularity suggests that he was reaching an audience who attached diminishing weight to these traditions and were struck by his insistence on citizens' essential equality and their right to challenge the status quo. He was prosecuted for sedition and outlawed—but by this time he had returned to France, having been elected to the National Convention in the summer of 1792.

Paine's association with Girondin leaders in Paris, and his plea for clemency for Louis, led to his imprisonment in 1793, and he narrowly escaped execution. His *Age of Reason* (1793–94) was being passed to publishers in France and England as he was arrested. It is a powerful piece

of deist literature, coupled with an attack on the authority of the Bible and organized religion that succeeded in dividing many of Paine's English supporters, scandalizing readers in America, and establishing a republican deist current in British radicalism that lasted well into the nineteenth century.

In 1796, responding to the attempted coup by François-Noël Babeuf's "conspiracy of equals," Paine's *Agrarian Justice* set out a principled case for a tax on inheritance so as to provide a capital grant for all reaching the age of majority, together with an annual pension for all at 50, arguing that the Earth is common property to the human race and that everyone is owed compensation for the private appropriation of it.

Paine finally left France for America in 1803, during the Peace of Amiens, but he was vilified on his return for his radicalism, his deism, and his embittered attack on Washington, whom Paine blamed for failing to lobby for his release under the Terror. He died in obscurity in 1809.

Pan-Africanism

Pan-Africanism

614

615

Pan-Africanism

Pan-Africanism was born from a bond of solidarity among Africans and their descendants who shared a common condition imposed by the Trans-Atlantic Slave Trade and its aftermath. It grew as a result of colonialism and its racist ideology and was further developed with the advent of African countries' independence in the mid-twentieth century. Pan-Africanism is a loosely knit and sometimes contradictory constellation of ideas, organizations, and movements that transcend national borders.

The ideals that distinguish Pan-Africanism include the need for Africa to unify for the greater economic, political, and social good of all Africans; the existence of an African personality; the vital connections between continental Africans and Africans in the diaspora; the necessity to protest racism and to assert the contributions of African civilizations; the need to remove all vestiges of colonialism; and the desire for human dignity. Each of these ideas was developed at different times for a variety of political ends, and no one Pan-Africanist will subscribe to all of its ideas. Pan-Africanism includes a cultural dimension in that artists have turned to the continent as a source of their inspiration.

Pan-Africanism's roots are to be found in the experiences of Africans enslaved in the New World. Olaudah Equiano was among the first to assert an identity that was continental in scope. His autobiography, *The Interesting Narrative of the Life of Olaudah Equiano or Gustavus Vassa the African* (1789), described the horrors of slavery and was used by abolitionists. He

became a spokesman for the enslaved and urged European powers to develop Africa without exploiting its human resources.

Other early Pan-Africanist leaders promoted emigration to West Africa as a solution to the racism they endured. Paul Cuffee of the United States, whose father was African and mother Native American, founded a settlement in Sierra Leone, a colony established by British authorities for the formerly enslaved. In 1868, Sierra Leonean James Horton proposed the development of modern independent African nations based on the traditional ethnic communities. Emigration to Liberia was supported by organizations such as the American Colonization Society. Edward Blyden became a citizen of the newly independent Liberia when he moved there from his birthplace in the Caribbean island of St. Thomas, and he is considered to be one of the greatest explicators of Pan-African concepts. His disciple, J. E. Casely Hayford of the Gold Coast, spoke of an international feeling among all black people and established a National Congress of British West Africa. Both Blyden and Hayford were cultural nationalists who supported the movement of independent churches in West Africa and believed in the glorious past and future of the continent, or “Ethiopia.”

Other advocates of back-to-Africa emigration included Henry McNeal Turner, a bishop of the African Methodist Episcopal Church, and Marcus Garvey. Garvey, originally from Jamaica, moved to the United States and founded the United Negro Improvement Association, a mass movement in the twentieth century that promoted racial pride and economic advancement. Garveyism was to influence a number of continental Africans, most notably Kwame Nkrumah of Ghana who used Garvey’s Black Star symbol on Ghana’s national flag. Other theorists included historian C. L. R. James of Trinidad, who focused on the exploitation of labor in Africa and the diaspora, and Walter Rodney of Guyana, who documented Europe’s underdevelopment of Africa.

As founding father of Pan-Africanism, W. E. B. Du Bois organized many Pan-African congresses to bring together Africans, African Americans, and West Indians to discuss mutual problems and to pressure colonial governments to allow for greater self-determination for their colonies. The first Pan-African Congress took place in 1900 in London, and others

followed in 1919, 1921, 1923, and 1927. The Sixth Pan-African Congress held in Manchester, England, in 1945 marked a turning point. Many of the attendees were students who were to become the leaders of their countries, including Kwame Nkrumah (Ghana), Jomo Kenyatta (Kenya), and S. L. Akintola (Nigeria). After 1945, Pan-Africanism's leadership shifted to Africans and subsequent congresses were held on African soil.

While the West African Student Union in London kept the ideas of Pan-Africanism alive, African and West Indian students from France's colonies founded the Society for African Culture. They developed the concept of "Negritude," a theory that espoused a distinctly African way of confronting the world. The scholarly journal *Présence Africaine*, with Alioune Diop as its editor, was established as part of this movement. Léopold Senghor, a poet and the future leader of independent Senegal, saw the Pan-African aspect of Negritude in terms of a bond of psychological identification among a people with the same origins who yet display a diversity of cultural attributes. For him, there was a basic core of values that are maintained, but modifications have occurred over time and distance as Africans traveled across the Atlantic and throughout Africa. This cultural component of Pan-Africanism was easier to organize and sustain than the more contentious political side.

Culturally, Pan-Africanism exerted a global influence. The Harlem Renaissance emphasized Africa's significance. Artists such as Josephine Baker, Claude McKay, and Paul Robeson affirmed a pride in Africa and a global connection between all Africans. The Harlem Renaissance influenced African and West Indian artists such as Fela Kuti of Nigeria and Bob Marley of Jamaica, who developed new musical genres that influenced artists globally and expressed Pan-African sentiments. Today we see the continuing influence of Pan-Africanism in North America in celebrations such as Kwanzaa, a celebration of African culture established in 1966 by Dr. Maulana Karenga, professor of Africana Studies at California State University, Long Beach.

In post-independent Africa, unity splintered and solidarity waned. The sentimental aspect of Pan-Africanism dissolved with the Cold War and the tenacity with which colonial powers maintained their colonies. South Africa

and Rhodesia were reminders of the need to rid the continent of the worst manifestation of colonial ideology. The Pan-African visions for the continent of theorists and activists like Frantz Fanon (Algeria) and Amílcar Cabral (Guinea Bissau) could not be realized without bloodshed. Others called for a more cautious approach.

Pan-Africanism influenced states' foreign policies, most notably Ghana's under Nkrumah and Egypt's under Nasser. Nkrumah's visions for unity included the entire continent. According to Nkrumah, African cultures had merged customs of many ethnic groups into what he called the African personality. Thus, Africa needed to unify under one government and have a military high command. Only then could it assert itself on the international stage. Nasser's foreign policy reconceptualized Egypt as an African country that had responsibilities to defend the continent from external aggression.

The divisions between leaders would only allow for the laying of the foundation for a Pan-African institution that would, at some distant future, lead to political union. The Organization of African Unity was established in 1963 in Addis Ababa, Ethiopia, and it represented a more moderate Pan-Africanism that sought to promote decolonization and development. Its member states, however, enjoyed full sovereign rights. In 2002 the OAU was disbanded and its successor, the African Union was established, which continues to promote the welfare of all Africans.

Pareto, Vilfredo

Pareto, Vilfredo

615

617

Pareto, Vilfredo

Vilfredo Federico Damaso Pareto (1848–1923) helped lay the foundations for modern economics during the late nineteenth century. He then broadened his focus within social theory to embark on an ambitious (and still controversial) sociological project that has made important contributions (alongside works by Gaetano Mosca and Robert Michels) to classical elite theory, a school of thought emphasizing the inevitability of elite rule. An enduring influence on Pareto's sociological imagination was Niccolò Machiavelli, whose psychological realism famously viewed princes as “lions” or “foxes,” and whose functionalist thought viewed princely success or failure as hinging on the adaptivities of leonine and vulpine outlooks to changing times. These ideas led Pareto to theorize an endless “circulation of elites” (Pareto [1901] 1968). Pareto went on to situate his elite theory within a much broader macrosociological framework, called “general sociology,” which emphasized the roles played by political and economic elites in driving or resisting general social change (Pareto [1916] 1935). Pareto's general sociology referred to history as a “graveyard of aristocracies” (Pareto [1916] 1935, §2053). Elite failure in adapting to changing social conditions was theorized to have precipitated elite downfall and replacement many times down the centuries. In his last major sociological work (Pareto [1921] 1984), Pareto developed a more predictive theory of social change, concerned with properties of social systems that determine whether, and at what pace, elite adaptations occur.

Pareto's sociological concerns reflect his life experiences. His ancestors were wealthy Genoan merchants loyal to liberal republicanism. Political activism led his father, the Marquis Raffaele Pareto, a prominent follower of Giuseppe Mazzini, into temporary exile in France, where Vilfredo was born in July 1848. Italian unification soon made it safe for the family to return to Italy. Vilfredo graduated at the top of his class at the Polytechnic Institute in Turin, where he studied mathematics and engineering. His 1869 baccalaureate dissertation, theorizing solid bodies as systems of interacting parts held in equilibrial balance, would later inspire his sociological vision (*contra* Marxist and other forms of reductionist explanation) of social forms as dynamic systems in complex equilibria that interlink polity, economy, and society.

During the long liberal period that followed Italian unification, Pareto worked first as a consulting civil engineer on Italy's newly nationalized railroads and then as general superintendent of three iron mines. Having made influential political acquaintances in Florence (notably among the Peruzzi family), Pareto was inspired to follow the family tradition as a liberal activist. However, what he saw around him seemed to betray the progressive hopes of Italy's liberal reformers. In Italy's rapidly modernizing polity and economy, "corruption" had become a commonplace accusation leveled against politicians and government officials. Pareto's simple psychological characterizations of vulpine elites as elites that use "fraud" to gain and maintain power could therefore appeal to the political common sense of the day. Italy's drift toward government favoritism and military expansionism, according to Pareto, was wholly at odds with how liberal economies should operate. A devout free-marketeer, impressed by the Manchester School liberalism he witnessed on business visits to the United Kingdom, Pareto wrote hundreds of pamphlets and made heated public speeches calling for free trade and pacifism. He stood unsuccessfully as a parliamentary candidate in 1881.

Papers pioneering mathematical approaches to economics won Pareto the respect of the economist Maffeo Pantaleoni. In 1893, he succeeded Léon Walras as professor of economics at Lausanne University. Pareto's first major work, the (1896–97) *Course in Political Economics*, proposed his "law of income distribution," which claimed that the elite 20 percent of

every society takes 80 percent of its income. Inspired by the idea that economic phenomena like this are only explicable within broader social and political contexts, Pareto began to develop his general sociology. This sociological voyage always remained bound up with the study of elite rule. Pareto would continually stress (in line with Machiavelli's view of *homo politicus* as a power seeker, and as a challenge to the Marxist belief in proletarian class dictatorship leading to communist utopia where political power is no longer necessary) not only the grim inevitability of elite rule but also the foolishness and vulnerability of those who manage to retain power. The emancipatory hopes of nineteenth-century Marxism and liberalism here gave way to a historical pessimism emphasizing that humanity does not learn from its mistakes, and that social forms do not so much progress in linear fashion as alternate endlessly between phases of austerity and prosperity.

Pareto's sociology reflects Italy's modernization pains. The Machiavellian-Paretian strategy of vulpine "fraud" resonated within Italian consciousness because it manifested in the widely resented practices of *trasformismo* (where cabinet ministers would survive government changeovers by opportunistically switching allegiances and policy preferences) and *clientelismo* (where the allegiances of elected politicians that mattered most were not those toward electors in general but those toward key "Grand Electors" who most influenced political candidate selection and voting behavior). The Machiavellian-Paretian strategy of leonine "force" was also important for political commentators insofar as it seemed to underlie the widespread street violence that saw Italy's communists pitted against those proto-fascist activists who would eventually coalesce as Mussolini's "Blackshirts." Pareto's sociological sensemaking took place when democratic elites stood at the brink of overthrow by both extremist movements. For Pareto this was fundamentally not a conflict between left and right but between established elites who instinctually preferred "fraud" and rival elites who instinctually preferred "force" in their efforts to maintain or seize power. There will come a time, he wrote, "when the lion will reach the fox with a well-aimed cuff" (Pareto [1916] 1935, §2480, footnote). Pareto's Machiavellian characterizations of political actors remain tantalizing. Raymond Aron (1967, 171) suggests that at the "living heart" of Paretian thought we find the idea that each political human is

either selfish (like the rapacious, materialistic, and fraudulent fox) or naive (like the violent, ideologically zealous, and gullible lion).

Peronism

Peronism

617

618

Peronism

Peronism is an Argentine political movement named after Juan Domingo Perón (1895–1974), President of Argentina from 1946 to 1955 and from 1973 to 1974. Peronism, also known as Justicialism, is the official doctrine and platform of the *Partido Justicialista* (Justicialist Party) or the Peronist Party. It combines elements of corporatism, socialism, and nationalism; scholars have identified the Catholic labor doctrines of the papal encyclicals *Rerum Novarum* and *Quadregesimo Anno* and the works of Carl von Clausewitz as specific intellectual influences on Perón's political philosophy. Perón also cited historical military-political figures such as Lycurgus of Sparta, Julius Caesar, and Napoleon Bonaparte as his influences.

The tenets of Peronism emerged after Perón's ascension to the presidency in 1946 and were greatly shaped by the process of that rise. Perón was a career military man who participated in two coups—the first in 1930 and the second in 1943. In the interim, he had served as an instructor in the military academy in Buenos Aires and as military attaché in Italy at the beginning of World War II. During this period he wrote essays that served as the basis of his later doctrine. After the 1943 coup, in which he was a prominent co-conspirator, he served as secretary of labor, using this position to build a support base in the labor movement. It was during this period that Perón's ideology first became widely known. Perón's critics labeled him a fascist, and in October 1945, he was forced out of the government and arrested. The ensuing general strike on October 17, 1945, by Perón's supporters is still

remembered as the most important protest in the nation's history, and during Perón's administration, its commemoration became a national holiday. This successful protest and Perón's subsequent election cemented his commitment to the interests of labor and set the direction of his ideology.

Perón and his administration spent the remainder of his first presidency (ending in his overthrow in September 1955) refining the ideology described alternately as "Peronism" or "Justicialism" and propagating it through the nation's media and educational institutions. Perón defined his philosophy as a "third way"—an alternative to both the "materialist individualism" represented by the United States and the "statist exploitation" exemplified by the Soviet Union. Peronism thus struck a nationalist tone in the context of the Cold War. According to Perón, Peronism was fundamentally rooted in spiritual values in the Catholic Christian sense, and religious imagery often permeated Peronist rhetoric. The greatest emphasis, however, was on the ideas of "organized community" and "social justice." In describing these concepts, Perón's favorite phrase was "spiritual unity"—the idea that all members of the movement share not only a common set of values but also, in his own phrasing, a common soul. In practice, this entailed the creation of state-sponsored organizations to which all members of society would belong, such as labor organizations or the community organizations created by Maria Eva Duarte de Perón (Evita).

After the coup of September 1955, Perón was forced to flee Argentina, and over the next 17 years, Peronism underwent a prolonged transformation. Within Argentina, those in power alternately attempted to appeal to Perón's supporters or suppress them, while these same supporters attempted to engineer his return. After the Cuban Revolution of 1959, younger Argentines combined their notions of Marxism with their antagonism toward the governments in power, creating a new brand of Peronism that embraced a more radical left-wing ideology. With Perón's return to power in 1973, these two generations of Peronists came into direct conflict, particularly after Perón's death in 1974. In 1976, the military once again seized power and brutally suppressed all political discourse in the nation.

After the return of civilian government in 1983, the *Partido Justicialista* regained its position as the dominant party of the nation. Although the policies of Peronist governments have varied over the subsequent 30 years, they have all continued to wield the imagery of Juan and Evita Perón in order to rally support and, thus, have used the philosophy of Peronism to guide their official platform.

Scholarly discussion of Peronism began in the aftermath of the 1955 coup. Many of these works debated whether or not Peronism merited the name “ideology” as opposed to being a mask for Perón’s desire to rule as he pleased. Significant works in this area include Torcuato Di Tella’s articles “Populismo y Reforma en América Latina” and “La búsqueda de la fórmula política argentina,” Daniel James’s *Resistance and Integration: Peronism and the Argentine Working Class, 1946–1976*, David Rock’s *Authoritarian Argentina*, and James Brennan’s *Peronism and Argentina*.

Physiocracy

Physiocracy

618

619

Physiocracy

Physiocracy was a mid-eighteenth-century school of economic thought that emphasized agriculture as the source of national wealth and, consequently, held that such wealth should not be seen as a stock of gold or money but as an annual flow of revenue. Originally developed by François Quesnay (physician to Madame de Pompadour) and the Comte de Mirabeau in the later 1750s, it was developed more systematically and named as such in the later 1760s.

The most striking monument to physiocracy is the *Tableau Économique*, first published in 1758–59 and then widely disseminated in a condensed form as part of Mirabeau's *Philosophie rurale* (1763). The *Tableau* is a zigzag diagram of the exchanges of goods and money arising among three distinct economic classes—agricultural producers, landed proprietors, and manufacturers—beginning with a transfer from the first to the second of the entire annual net product of the land. The proprietors return half of this revenue to the agricultural sector as purchases of food and wine and transfer the other half as “sterile expenditures” to the manufacturers of luxury goods, who then in turn spend half of their income on food and wine and the other half on manufactured goods—and so on through the year, until the entire system runs down to nothing and the next harvest starts the sequence once more.

Quesnay's diagram embodied many of the leading features of physiocracy. It treated the process of production and exchange as an autonomous, natural

order—hence the name—which functions most effectively if left to work freely—“laissez-faire” being the watchword adopted by Quesnay and Mirabeau. Agriculture being the source of this process, manufacturing was treated as “sterile,” incapable of creating the net product that sets the system in motion. Consequently, all taxation should be levied directly on this net product in the form of a single agricultural tax. These last two features formed the principal part of contemporary criticism, although in *Wealth of Nations* (1776), Adam Smith praised the system because of its emphasis on the annual production of wealth (a key idea in *Wealth of Nations*) and the presumption that a “system of natural liberty” was required for it to function effectively. Smith did however clearly reject the notion that agricultural labor was uniquely productive and that manufacturing labor was unproductive.

Summarizing the features of the “new science” in 1768, Pierre Samuel du Pont de Nemours argued that among the natural rights of man was the right to provide for his own subsistence, together with property in his person and the products of his labor. He later insisted that, “without property, no liberty; without liberty, no security.” This principle was explicitly linked by the physiocrats to support for freedom of trade in grain, arguing that this would stimulate domestic producers, bringing with it also the prospect of importing luxury products in exchange for the products of French agriculture, increasing the disposable net product (and hence tax revenue) while limiting the activities of the sterile class and, in this manner, preserving the balance between the classes that the *Tableau* was designed to express. This stance on the grain trade therefore opposed contemporary protectionist policy and implied a generalization of domestic free trade to the international level.

As the school won converts, discussion moved away from the optimal organization of an agricultural economy toward more general disquisitions on natural law, elaborating the philosophical underpinnings of the policy regime. Although France did temporarily adopt free trade in grain, the opposition with which this met from both the public and the administration led to a reversal of the policy in the early 1770s. A promise of greater welfare in the long run could nowhere overwhelm a fear of shortage in the

short run. And in a predominantly agricultural economy, it is in the short run that one either lives, or starves.

Although the movement became more muted in France by the 1770s, its principles were not without influence abroad. Spain adopted grain liberalization in 1765 on the Physiocratic mode; Mirabeau advised the ruler of Tuscany; and in Germany several indigenous “Physiokraten” sought to promote the doctrine during the 1770s. It was in Germany that the most thoroughgoing attempt was made, in the state of Baden, to adapt the fiscal regime to physiocratic requirements, and here again the ruler entered into a lengthy correspondence with Mirabeau over both principles and practice.

Planning

Planning

619

621

Planning

Planning is a generic term that is used in different contexts, ranging from governments to businesses and individuals.

Although all governments have to plan to some degree (for budgets, defense, infrastructure, etc.), the *extent* to which they do so varies according to political dogma. Those nations that are most committed to planning are likely to be socialist (including national socialist) or communist regimes. Most famously, the former Soviet Union was based on principles of Marxism-Leninism and espoused the idea of total planning. By means of central control, it was contended that resources could be allocated efficiently and equitably. Although the theory might have seemed faultless, in practice planning in fine detail on a large scale is difficult, if not impossible, to achieve. The collapse of the Soviet Union was seen by many as evidence of the shortcomings of centralized planning.

In contrast, other governments have followed a different ideological path, seeking to limit the role of the state and allow the market to allocate resources. The view is that decisions are better made by individuals and corporations rather than through a system of central planning. Generally, such regimes can be classified as liberal or neoliberal (in the sense of an approach that champions free trade and individual rights) and the economic system that is favored is capitalist. The reality is that even the most fervent adherents of this approach have found it difficult to undo what is already in place, with the result that in modern economies, government intervention

tends to increase. An interesting variant of laissez-faire is anarchism, which also opposes “big government” but at the same time rejects capitalism as the prevailing system. Some anarchists are not opposed to planning *per se* so long as it is community-based. Instead of top-down planning, their approach is bottom up, with localized decisions coalescing through a federal structure.

In a more focused context, the term “planning” is used to denote various forms of land-use control. Descriptors such as town and country (or urban and rural), regional, and environmental all define different fields of application.

Modern versions of land-use planning date from the nineteenth century in response to the adverse effects of unregulated urban growth resulting from large-scale industrialization. One kind of response was through model settlements to show how better living and working conditions could be achieved through purposeful action. Some of the more radical idealists at the time (such as Robert Owen) argued that their schemes could not fully be achieved in a capitalist system. Others, however, built well-planned industrial villages (such as Bournville in England and Margarethenhöhe in Germany) to demonstrate that social improvement and capitalism could, indeed, go hand in hand.

In contrast, a more broad-based approach saw legislation as the priority. By the middle of the nineteenth century, reformers were promoting measures to ameliorate the worst aspects of unplanned development. Public health and housing campaigns, in particular, led governments to introduce new laws and the appointment of officials to enforce them. Germany and Britain both saw the earliest advances, and it was the British Parliament that in 1909 passed the first town planning legislation. It was quite narrowly based, but progressively, coverage was extended and variations on the general theme of planning were adopted in most countries around the world. Its global spread in the twentieth century is widely considered to be a mark of human progress, and indeed, there have been various exemplars in the form of new towns, the curbing of urban sprawl, and protection of natural environments. Some of the best examples are to be found in the Scandinavian countries. In the context of an ever-rising world population, diminishing natural

resources, and the prospect of climate change, planning is now closely identified with goals of sustainability.

Despite its widespread adoption, planning is also open to serious criticism. For one thing, planning decisions are often shown to favor those who control the process rather than the rest of the community. A second, related, point is that—because of the financial gains that can result from a change of land use—planning is too often tainted with evidence of corruption. Third, the very application of land-use controls limits the supply of land, resulting in higher costs for housing and other development. Finally, on a global scale, planning has proved to be a relatively blunt instrument to cope with the present rate and complexity of urban growth. Cities in many parts of the world are growing at an exponential rate, so much so that most people are now urban dwellers. Planning, however, has so far proved unequal to the challenge.

Pluralism

Pluralism

621

622

Pluralism

The adjective *plural* means, simply, “more than one,” and therefore, the noun *pluralism* refers to the “condition” of plurality—a situation characterized by its very lack of singularity. Although the adjective *plural* could be used to modify numerous grammatical objects (e.g., plural cats), within the context of political philosophy pluralism signifies a multiplicity of values, opinions, judgments, convictions, and beliefs. Pluralism points to a persistent state of variety or difference, and thus, it stands in contrast to absolutism (in politics), to fundamentalism (in religion), and to monism (in philosophy). Given this account, pluralism can be conceptualized in five distinct ways:

1. As an empirical-historical description of facts
2. As a metaphysical or moral philosophy
3. As a ground or a framing context for political theory
4. As a type of democracy
5. As a theory of the political

First, then, pluralism has a particular history in that both the idea of pluralism and the philosophical and political “problem” of pluralism emerge at a particular point in time. Many political philosophers attribute the first historical emergence of pluralism to the Protestant Reformation and the questions of religious tolerance that it raised: Toleration becomes an issue only after the emergence of a recognizable plurality of potentially acceptable religious beliefs takes shape in Europe in the sixteenth and

seventeenth centuries. This plurality of religious beliefs provides the context for the later appearance, especially in the nineteenth and twentieth centuries, of “value pluralism.” Conceived widely, “value pluralism” denotes the historical existence of distinct and potentially competing systems of belief—be they religious, philosophical, moral, or political.

Second, however, a philosophy of pluralism conceives value pluralism in narrower and more specific terms. According to moral theory, “value pluralism” suggests not merely a multiplicity of values but an incommensurability as well. This argument begins with the claim that even at its most fundamental level, the universe itself proves to be *plural*. At the same time, these multiple sets of values or systems of belief necessarily conflict. Because there is no common metric to judge between or among values, value pluralism contends that different values cannot be ranked, and the conflict between them cannot be reasonably adjudicated. Ultimately, there can be no logical or philosophical reason to choose one set of values over any other. The gap between them is incommensurable; the conflicts among them are irreconcilable. Therefore, a philosophy of pluralism must strictly reject any monist account of the world. Monism contends that all multiplicity is ultimately reducible to oneness, whereas pluralists insist that no such reduction is possible.

Third, then, *political* philosophers need not enter the debates over value pluralism; yet those debates provide the context for their project. John Rawls argued that any theory of justice must begin by accepting and responding to what he called the *fact* of reasonable pluralism. For Rawls, a free society will be marked not just by a plurality of values but by a plurality of *systemic, comprehensive, and reasonable* views. “Systemic” means that they are not mere tastes (which would be irrelevant to questions of justice); “comprehensive” means that they are a part of an overall worldview that an individual holds and that fundamentally shapes his or her identity; and “reasonable” means that the comprehensive worldviews cannot be reconciled within a single system. Thus, the question of politics becomes as follows: How might we devise a constitutional system based on principles of justice that recognize the indisputable facts of “reasonable pluralism”—how do we overcome the limits and constraints placed on a theory of justice by these background conditions?

Fourth, because pluralism implies both choice (of individuals) and multiplicity (of groups), we can see it as a type of modern democracy. Under a notion of “pluralist democracy” individuals and groups have the right to seek their own benefits but in such a way that may weaken the solidarity of the community as a whole. In Europe, decades of increased non-European immigration and the resulting unprecedented religious and ethnic diversity have created serious and unresolved social and political conflicts. In the United States, beginning in the 1950s—and drawing from the earlier “group theory” of Arthur Bentley (1908)—leading analysts of pluralism have problematized its effects on public policy and public life. Robert Dahl (1956) replaced what he saw as the fiction of majority rule with the reality of *minorities rule*, or polyarchy, a system in which a vast array of interest groups compete to shape public policy. Taking Dahl further, Theodore Lowi ([1969] 1979) concluded that the pluralistic system of Interest Group Liberalism had defaulted on traditional concerns about justice by defining as “just” whatever is the outcome of the competition among interest groups. Finally, Robert Putnam (2000) explored the progressive loss of social capital—especially trust, communication, and social networks—that had traditionally underpinned the democratic and civic life of communities.

Fifth, pluralism can be conceptualized not as a limit to politics but as the very stuff of politics. This is a theory of politics as *pluralization*. In this approach, pluralism is not a problem to work around but something to embrace. Even a thinker as concerned as James Madison (1787) was about the factional downside of pluralism, replete with conflict and potential tyranny, argued for controlling its effects rather than, as Jean-Jacques Rousseau (1762) had proposed, trying to eliminate it and thus deny pluralistic liberty. In this tradition, pluralism is not a constraint but a goal. A theory of pluralization places difference, diversity, and even strife and conflict at the heart of the theory of politics. Politics becomes, then, not an effort to quell conflict, to search for consensus, or to overcome the problem of reasonable pluralism but an arena in which the politics of pluralism is played out—a space in which agonistic conflict and a spirit of pluralization are fostered and allowed to flourish.

Thus, by the twenty-first century, pluralism has come to be seen as either a political problem or a political solution; clearly we grasp it more accurately as a complex combination of the two.

Polish Political Thought

The partition of the Polish-Lithuanian Commonwealth in 1795 between Prussia, Russia and Austria and the resulting lack of independence and national unity for 123 years have etched themselves deeply on Polish political thought. The national disaster was caused by the weakness of royal power and the dominance of the nobility (*szlachta*) in the Parliament (*Sejm*), which with its power of veto (*liberum veto*) could paralyze any sovereign decision. The May constitution (promulgated on May 3, 1791) had tried to remedy this “Golden Liberty” by abolishing the *liberum veto* and introducing the constitutional monarchy. Although it came too late to generate concrete effects, it was very important because it marks the maximum expression of currents of political thought influenced by the Enlightenment. However, the political ideas of the Enlightenment—whose main exponents were Roman Ignacy Franciszek Potocki (1750–1809), Hugo Kołłątaj (1750–1812), and Stanisław Małachowski (1736–1809), who inspired the May Constitution—were expressed in Poland not as an attempt to limit the sovereign power (which in fact was very weak) but as an attempt to remedy the anarchy as a result of the excessive use of *liberum veto* and of the dominance of the nobility. A more radical approach was taken by Stanisław Staszic (1755–1826) who defended the interests of the lower classes, especially the peasants, and was a supporter of laissez-faire and of the physiocrats’ thought, as well as of a republican constitution. *Stronnictwo hetmańskie*, or “Hetman’s party,” which was formed by the

enemies of the May Constitution and of the patriotic party, was pro-Russian and acted in defense of “Golden Liberty.”

Polish political thought after 1795 is marked by the experience of exile and enslavement. Between the two failed riots of 1830 and 1863, political Messianism spread. Founded by Józef Hoene-Wroński (1776–1853), it was characterized by the close connection between spiritualist philosophical speculation and faith in the metaphysical significance of the Polish nation, seen as the vanguard for the liberation of oppressed peoples. Its most important representatives were the poet Adam Mickiewicz (1798–1855), August Cieszkowski (1814–94), and Karol Libelt (1807–75).

The defeat of the revolution of 1863 led to the end of the Messianic illusions and to a political return to realism, which was philosophically expressed by Polish positivism. In the new conditions, the positivists maintained their loyalty to the three occupying powers. Aleksander Świątochowski (1849–1938) proposed the program of “organic work,” consisting of the importance attributed to a methodical activity devoted to the education of the young generations and to foster the civil and economic progress of the country.

A more conservative trend was represented by the intellectuals and politicians who were called “stancists” (*stańczycy*—from the name of political pamphlets titled *Teka Stańczyka*, “Stańczyk’s briefcase”), who criticized the attempts to achieve independence and supported collaboration with the occupants as the only way to ensure a gradual sociopolitical evolution of the country, controlled and guided by the elite.

In this period also Socialist and Marxist thought developed in the territories of Poland, but this school of thought underestimated the problem of national independence, seen as an instrument of reactionary classes aiming to divide the proletariat. The most significant thinkers were the social-revolutionary Ludwik Waryński (1856–89) and the social-democratic Stanisław Krusiński (1857–86). A more original approach was the “philosophy of praxis” of Stanisław Brzozowski (1878–1911), who insisted on the “subjectivist” factor in history, against any kind of economic determinism. As a result of this, he was seen as a forerunner of the ideas of the so-called “Western Marxism.” The political thought of Kazimierz

Kelles-Krauz (1872–1905) was instead strongly influenced by positivism; his so-called “law of retrospective revolution” maintains that the ideals of a new reform movement are always similar to the ones of the past, whether recent or distant. On the other hand, the socialism of Edward Abramowski (1868–1918) veered toward a conception of anarcho-syndicalist politics; he stressed the importance of self-organization of the masses in the form of the cooperative.

After the achievement of national unity at the end of World War I, the main political topic was no longer that of independence, but the construction of a strong state, able to withstand its powerful neighbors. The political debate had two reference points vying with each other, both with a conservative outlook: Marshal Józef Piłsudski (1867–1935) and Stanisław Roman Dmowski (1864–1939). Supporters of the first (such as Adolf Bocheński, 1909–44) shared hostility toward Russia, the idea of the need for a strong executive power, and the project of a Polish republic as a federation of nations of central and eastern Europe, not as a nation-state, recovering the old idea of the Polish-Lithuanian Commonwealth. Dmowski, the founder of the Polish school of political realism and responsibility, stressed the need to accept the modern rationalist and scientific world, and to abandon the obsolete nationalistic romanticism and the typical attachment to old values of the Poles. He believed that it was necessary to bring Poland into existence as a nation, freeing it from the burden of minority nationalities (i.e., the Jews, against whom he expressed a clear anti-Semitism), to build a “national state” with a single language and religion. Zygmunt Balicki (1858–1916) had similar ideas.

With the rise of communism after World War II, political theory was forced into a frame of an internal debate within Marxism. In the early years, Adam Schaff (1913–2006) was an important figure; after an initial membership of Stalinist orthodoxy, he gradually assumed a more open position and ended up becoming one of the leading representatives of humanistic Marxism. He was gradually embracing the positions of Leszek Kołakowski (1927–2009) known for so-called “Marxist revisionism,” stressing the importance of the moral judgment of the individual, which cannot be justified by historical necessity.

Socialist and Marxist ideas also were found in the writing of Ludwik Krzywicki (1859–1941), who proposed the idea of “historical substrate,” which stresses the strength of the institutions, beliefs, anthropological characteristics, and human “psychic races” in changing the general law of the historical process indicated by Marxism. Another of his conceptions is the theory of “migration of ideas,” according to which ideas can “migrate” (even in later times) from the country where they originated to other countries that because of their less developed social conditions are incapable of expressing these ideas autonomously.

The so-called “non-Marxist historical materialism” of Leszek Nowak (1943–2009) is the attempt to use an idealizing method to extend the dichotomy of capitalist/proletariat also to the dynamics of politics and culture, through oppositions of rulers/subjects and priests/believers. Another significant contribution is that of Jadwiga Staniszkis (1942), who criticized the myth of Solidarność and the theory of socialism and postcommunism as well as, more recently, the phenomenon of globalization.

The end of communism saw the rejection of Marxist political theories and a great opening toward the importation of Western thought, especially what was until then held on the fringes: neoliberalism, American neoconservatism, and the influences of Karl Popper and his ideas about open society. These Western strains of thought were often combined with indigenous traditions, such as neo-monarchist ideas. Among the most significant and young representatives of these trends are Marcin Król (b. 1944), Paweł Śpiewak (b. 1951), Jacek Bartyzel (b. 1956), Robert Gwiazdowski (b. 1960), and Marek Cichocki (b. 1966).

Political Culture

Political culture

626

Political Culture

If politics poses the question of “who gets what, when, where, and how,” then political culture supplies a big part of the answer. If politics is the “art of the possible,” then political culture helps define the limits of that art, for culture defines what is generally permissible in a given society.

At its core, political culture—the shared values and beliefs of a group or society regarding political relationships and public policy—answers the question of how human beings are going to live together. That is, political culture answers the question of who gets to do what with and to whom under what circumstances. Political culture also answers the question of who decides, who has authority, and who has power in a group, organization, institution, or other social unit in society. In answering this latter set of questions, political culture also supplies much of the answer to the two prior questions about “who gets . . . ?” and “what is possible?” When elements of popular culture, high culture, and/or the culture studied by anthropologists are seen to impinge on or be entailed in political culture, then, arguably, they become part of the answer to these questions as well.

It is the political socialization process that produces and reproduces cultural attitudes about power, legitimacy, authority, and public policy. This process, by which political values and beliefs are instilled in citizens, is controlled and shaped by such interrelated authorities as parents, teachers and boards of education, clergy, business owners and media programmers, and public officials. These agents of political socialization determine what political

themes will prevail in the consciousness of citizens regarding the proper purpose of government, the role of ordinary citizens in the political process, the kinds of people who should be entrusted with decision-making authority, the political limits and possibilities of human nature, and the ways in which government should or should not be involved in economics, education, religion, and the family. In general, the prevailing political culture tends to help perpetuate the existing structure of power, but under certain circumstances, the opposite may be true. Political change, including revolution, is invariably preceded by a weakening or challenging of the existing political culture. And political culture can itself be a source of change when we conceive of countries and organizations as being composed of contending political subcultures.

Political culture has been and remains an important concept for many political scientists, and it will probably always be so. Aristotle, Charles-Louis Montesquieu, Alexis de Tocqueville, and other great students of politics sought to understand and explain political culture even when they did not use the term. Political scientists who have made political culture central to their research programs include Gabriel Almond, Harry Eckstein, Daniel Elazar, Ronald Inglehart, Robert Putnam, Sidney Verba, and Aaron Wildavsky. Almond and Verba's *The Civic Culture* (1963) and Putnam's *Making Democracy Work* (1993) and *Bowling Alone* (2000) are modern classics of political-cultural studies, and Elazar's *The American Mosaic* (1994) should become one.

In political-cultural studies, it has been common to focus on identifying the political attitudes, values, beliefs, and ideologies that are associated with and help explain the behaviors of certain individuals, groups, organizations, and institutions, and to study how the latter in turn contribute to the development of the former. Indeed, the complex, dynamic, and reciprocal relationships between psychological and cultural variables, on the one hand, and group and institutional variables, on the other, belie any simple or linear explanation of political cause and effect. Nonetheless, in many studies, political cultures are often characterized in nominal terms, so that analysts speak of the culture of countries, states, agencies, corporations, groups, and peoples.

Political scientists also frequently find it helpful to develop typologies of political culture and theories that help explain political-cultural similarities and differences in what would otherwise appear to be an incomparable, cacophonous array of entities and individuals. For example, Ronald Inglehart (1990) distinguishes materialistic from postmaterialistic political cultures; Daniel Elazar (1994) identifies individualistic, moralistic, and traditionalistic political cultures; and Aaron Wildavsky (Thompson, Ellis, and Wildavsky 1990; Wildavsky 1998, 2006) analyzes individualistic, egalitarian, hierarchical, and fatalistic political cultures.

The theories and types of political culture developed by these political scientists have stimulated a great deal of additional scholarly inquiry into political culture itself and into the related topics of political socialization, political psychology, and political economy.

Political Philosophy and Political Thought

Political philosophy and political thought

626

636

Political Philosophy and Political Thought

Political philosophy is parasitic upon political practice. The two, not identical, must be taken together. The most systematic of ancient philosophers characterized politics (knowledge of right conduct) as “the master science” (Aristotle, *Politics*). Such in *esse* is political philosophy, to which issues of public policy are central.

Sense

Political philosophy is given various names but has four key aspects:

1. sustained reflection on sociopolitical policy and organization;
2. emphasis on propositions of a general or universal type, and only particular where instantiating general or universal claims;
3. subordinate concern with descriptive or analytical generals and universals; and
4. predominant concern, not always express, with identifying the right and the good.

The fourth aspect (the evaluative, prescriptive, normative, ethical) is the subject’s cutting edge. Dazzling teeth, however, devoid of gums and bone, don’t bite. The saw of evaluation, prized from the haft of relevant facts and (especially) logic, cannot cut.

Propositions may be reduced to four basic types:

1. evaluative,
2. analytical,
3. empirical, and
4. aesthetic.

Various words pointing in slightly different directions are used to refer to these four types, but this entry does not address these variations. Basic disciplines can be classified, in part, with regard to the signal type of proposition each privileges. Leaving aesthetics aside, the cutting edge of political philosophy is evaluative (prescriptive, normative); that of physics is empirical (factual, descriptive); and that of mathematics is analytical (formal, logical).

While this classification of propositions helps to locate points of disciplinary divergence, “divergence” does not equal “mutual exclusion.” In the widely used expression *normative political philosophy*, the adjective, *normative*, implies only that political philosophy is distinctively evaluative, not that evaluation operates alone, on its own.

A political philosophy that is reasonably ambitious will be driven by an ethic, but bound up with an epistemology (“logic of discovery”) and an ontology (understanding of being, or the world). The questions regarding right action in the world—logical procedures for apprehending the world, together with some grasp of the world as it is—are all tightly intertwined.

Values, Facts, and Logic

Given that evaluation, description, and analysis are all caught up in political philosophy, three matching considerations apply. First, political philosophy, with its normative edge, is not independent of facts and logic, but combines the three types of proposition such that priority is accorded to norms. Second, physics and other descriptive studies again combine with evaluation and analysis, priority in this case being accorded to facts. Third, mathematics and similar computational (formal) disciplines recur to the same triad, analysis here forming its apex.

All spheres of understanding are to be presumed fundamentally connected, each new discipline branching from a single tree. The pervasive triadic distinction between norms, logic, and facts may not be read off as promoting empirical, to the exclusion of normative, inquiry. The articulation of this triad no more embodies *in se* a narrow positivism than an expansive idealism—though the triad may be misread either way. Some who embrace the distinction are tempted simply to sever core disciplines one from another. But the distinction enables others to grasp the logic of reciprocal dependence between the three apices.

In the specific case of political philosophy, it is easily shown (as below, in two stages) that any sustainable evaluative construct, without prejudice to the persistence of its normative character, is still welded to empirical and analytical struts.

Stage 1

A. *On the empirical side, “ought” implies “can.”* All normative claims are constrained by empirical presuppositions and conditions. No rule, principle, policy, or recommendation is tenable save on the minimal, but rigid, assumption that its enactment or application is empirically feasible. No rule or principle can be taken as valid in complete abstraction from the factual circumstances to which it relates and in which it is grounded. Political philosophy acquires purchase by reference to the actual conditions it is meant to understand, clarify, adapt, or direct. Philosophical ideals implicate political reality and the two must (in the end) be taken together.

B. *It would be incoherent to commit to any mission that is literally impossible.* A political philosophy is raised, and limited by dependence, upon some underlying ontology—a comprehensive complex of suppositions regarding the actual structure of the world (Being). The ontology may have to do with the fundamental structure of nature, of society, and the cosmos, and may divaricate along lines that are theological, biological, racial, economic, gendered, or other. Consciously formulated or not, the ontology sustains and constrains the normative proposals that are mounted on it. The broad manner in which an agent conceives Being (as a question of fact)

somehow consequentially impacts how that agent commits (morally) to altering or conserving it.

C. A broad image of the world must condition and constrain, without directly dictating, an attendant political philosophy.

Suppose the agent embraces a view—an ontology—of evil as an existential force in the world, whether materially embodied (Satan, Shaitan, Beelzebub, Mephisto), or moral (torture, cruelty), or natural (earthquake, tsunami). Suppose, further, the agent takes the view that human nature is marked by “original sin,” as in the “Christian realism” of Reinhold Niebuhr. This ontology or life-world (*Lebenswelt*; Edmund Husserl’s term) will not necessarily generate a precisely matching moral appeal for military “preparedness.” But it will more readily consort with armed resistance than, say, with promotion of unilateral nuclear disarmament.

Suppose, by contrast, the agent is of opinion that no such thing as a palpable and embodied evil stalks the world; that human nature is fluid and polyvalent; that wrong action results less from malevolence than from misunderstanding and miscalculation; that bad behavior stems more from dysfunctional systems than from ill-willed individuals; and that the actions of agents are reactive and interactive, being rarely (if ever) *sui generis*. Again, this ontology, like the first, will not necessarily lead into some exactly corresponding moral initiative. But it is less likely to consort with a preemptive military posture, and more likely to privilege political philosophies ranging from toleration and negotiation, at one end, to nonviolence and pacifism, at the other (e.g., Socrates; Mohandas K. Gandhi; Martin Luther King, Jr.; the Society of Friends)

D. Although “ought” implies “can,” “can” does not imply “ought”; “is” does not imply “ought.” It is often mistakenly supposed that “reality” directly dictates “morality.” Thus: “One truth is clear, Whatever is, is right” (Pope). Or again: “The real is the rational” (Hegel). However, *is* and *ought* are not identical; nor are *can* and *ought*. Reality is the condition, not the definition, of morality. The relationship is asymmetrical and nonreversible. On the one side, the applicability of any norm is burdened with and constrained by the empirical conditions pertaining to it; so the rightness of enacting the norm partly depends on the background conditions (the

underlying facts) to which it is designed to apply. Nonetheless, even if the background conditions are properly understood, that does not guarantee the rightness of enacting the norm. In sum: a sound ontology is a necessary, not a sufficient, condition for acting on related norms.

Stage 2

A. *On the analytical side, “ought” implies “coherence.”* Any supposedly normative political-philosophical claim, if it contradicts itself, or otherwise flouts basic rules of logic, is inept and inapplicable. A given claim—such as the maxim from George Orwell’s *Animal Farm* that “all animals are equal but some animals are more equal than others”—may sound like gibberish. That is because it is. “Doublethink” derives comedic effect from patent absurdity. A claim that is all incoherence suffices to dismiss itself. No evaluative claim stands where held up by lame logic. That the most distinctive feature of political philosophy is evaluative cannot imply that evaluation is a “lone ranger,” an isolate, a law unto itself. No “ought” is secure, torn from its moorings in logic.

B. *Again, “ought” implies “coherence.”* But “coherence” does not imply “ought.” The relationship between “ought” and “coherence,” like that between “is” and “ought,” is asymmetrical and nonreversible. A coherent train of reasoning does not, first, validate moral claims; and it does not, second, directly validate wider political conclusions. Coherence is a precondition, not a definition, of morality. Take the following syllogism:

1. Severely oppressive systems ought to be overturned.
2. System S is severely repressive.
3. Therefore, S ought to be overturned.

This syllogism, purely as a piece of logic, is indubitably sound. But the soundness of the syllogism does not demonstrate that its first term (i) is ethically or politically right. Nor does the correctness of the conclusion (iii) sanction the possible inference that any particular government, including “A” and “B,” ought to overthrow “S.”

C. In sum, political philosophy is distinctive by virtue of its evaluative edge. Yet it cannot be abstracted from dependence on the analysis and description integral to its success. On the one hand, political philosophy stumbles where any fact on which it depends is false, and it fails where the logic that feeds its conclusions is vicious. On the other hand, while an accurate descriptive foundation is needed to sustain normative claims, that foundation does not certify those claims directly and of itself. What holds for description holds equally for logic: though a coherent logical foundation is necessary to lend support to normative claims, it cannot directly guarantee them. The accuracy of a given chain of reasoning—from major and minor premises through to the conclusion—does not demonstrate the rightness of the major premise. Nor does it demonstrate the rightness of any intervention that an agent may undertake in support of that conclusion.

Evaluative Rationality

Rationality is initially grounded in the questions asked, whatever the answers subsequently elicited. Some questions (“May I have my cake and eat it too?”) are absurd. Some (“How many grains of sand are there under the sea?”) are just difficult—which is not the same as illegitimate or unimportant.

A technical subject that is preponderantly empirical or analytical, like biology, accountancy, or mathematics, is distinguished by its answers. For example, such a question as “What is the square root of x ?” or “How do bats navigate?” is normally expected to draw an answer, if it is correct, that is invariant. A nontechnical subject, however, such as political philosophy, is distinguished more by its questions, than by the invariant quality of its answers.

The questions raised by political philosophy cover an enormous range. On the one hand, some remain perennial. For example: “Is killing permissible?” “Ought the spoils go to the victor?” “Is obedience to law the highest virtue?” On the other hand, novel questions constantly arise. For example: “Should we tolerate the intolerable?” “Ought murderers be subject to capital punishment?” “Should corporations enjoy the rights of biological individuals?” “Is it right to respect the sovereignty of states, where states

abuse the rights of citizens?” Old or new, such questions have sense and reference, even though there is wide agreement that it may not make sense to expect the answers referenced to be entirely uniform.

Humans are fundamentally interdependent. As such, they constitute associations. The human, conceived as a perfect isolate, ceases to be human (as distinct from “a god or a beast,” following Aristotle). Questions as to how members ought to interact (what sorts of order they should construct) are thus unavoidable. Legitimate questions arise as to the proper actions of (1) member to member, (2) member to association, (3) association to member, (4) associations one to another, or (5) associations to environment.

Members (ultimately) have to devise terms of accord; these terms are not genetically imposed, certainly not directly; hence possible terms are always variable; and the consequences of following different paths can matter hugely (some better, some worse). It follows, first, that there is sense in committing to elicit what is better; and, second, that it is advisable to keep an eye open onto such generals (i.e., rules of thumb) or universals (i.e., fixed laws) as may point to, or be reflected in, what is better.

To foreclose *sine die* on inquiry, as by placing beyond the reach of possible counterargument propositions designated as “first principles” (secular procedure) or “articles of faith” (religious procedure), constitutes arbitrary conversion of dialogue into monologue. The legitimacy of questions—in this case about ethics, justice, and policy—extends to the legitimacy of the dialogic process such questions initiate. Stops in and to debate tend to be seen as justified only on practical grounds, not on grounds of principle. Thus, in the dialogic enquiry that constitutes political philosophy, there is no point at which the “buck” of argument stops. It is this that sets political philosophy apart from ideology and dogmatics (the latter specifically theological).

Political philosophy is studded with principles. The question arising is whether these are categorical and universal (idealism, Immanuel Kant) or are consequential and situational (utilitarianism, Jeremy Bentham). One who aspires to a fully coherent order will aspire to a universal code of behavior. One who believes rules must adjust to evolving circumstances will settle for general principles that serve as rules of thumb. Neither

position is irrational. But the first position is more demanding; the second more relaxed.

Whatever is said about the contest between principles, as universal and as situational, there is ample evidence that universal principles at points clash and prove incompatible (e.g., Michael Oakeshott, Alasdair MacIntyre). Rules give little appearance of being parallel lines, stretching to infinity. “Thou shall not kill” cuts across “legitimate self-defense.” Demands for liberty (as by owners of property) jostle against demands for equality (as by the homeless). Justice and punishment contend with opposing calls for forgiveness and tolerance. Neutrality and formality seek to throttle the desire for friendship and intimacy. Aspiration to decisiveness and efficiency contends against the interest in open and unlimited debate. This aporetic tension between political principles has the pull of gravity; against it, rationality engages (like Sisyphus) in unrelenting, up-and-down struggle.

If taken to be universally right without qualification, no principle, rule, or law—at least, none thus far formulated—appears to work altogether satisfactorily. Such principles ordinarily present less as universals, than as generals (rules of thumb)—aptly applying on the whole, but not necessarily in each and every case. Because of the difficulty of determining in what circumstances the rules apply, quite apart from the question regarding what the rules are and should be, marked divergences in broad outlook persist among political philosophers (e.g., consequentialism v. moral absolutism).

Political philosophy, as with any form of rational discourse, makes judgments about real, not phantom, issues, prompted by real and meaningful questions. As these questions differ, together with the circumstances generating them, so do appropriate ways of answering. The proper manner of answering empirical questions cannot be exactly the same as for analytical questions, or these the same as for evaluative questions. Aristotle, in the *Ethics*, notes that education and culture are confirmed in those who “seek in a subject no more precision than its nature allows.”

Culs-de-Sac

It has been argued by philosophers such as Ludwig Wittgenstein, A.J. Ayer, and John L. Austin that the evaluative edge of such a discipline as political philosophy, by virtue of being neither empirical nor analytical, has no objective basis. An empirical claim may be accounted “true” or “false” in virtue of available evidence for or against. An analytical claim may be accounted “correct” or “incorrect,” as a function of initial stipulations together with the consequences derived from these. An evaluative judgment does not technically qualify as either “true,” or as “correct,” but instead as “right” (or “wrong”). Doubts are persistently raised as to the objectivity of judgments of “right” and “wrong.”

Doubts notwithstanding, and despite cycles both of efflorescence and drought, there are no tenable grounds on which political philosophy might plausibly be dismissed. The most trenchant reason for this is that thinkers who believe normative questions are absurd—that they preclude pertinently objective answers—are themselves trapped in absurdity. Any agent, single or collective, caught in the swirl of ongoing activity, is not absolved from choosing (even if only now and again) between significantly opposed options. The actor who believes all action is fated must still consciously choose between “to be and not to be,” between p and not- p , and is compelled, reflectively, to seek reasons for choosing one over the other, even in face of the possibly firm conviction that no genuine choice is possible (or rational). The fact that a given array of options, on a particular occasion, may be equally bad (or good), does not mean that is so on all occasions.

The process of choosing takes form in the agent’s mind as a reflective attempt to distinguish better from worse. Being inescapably engaged, the agent cannot categorically claim, regarding all pressing options and possible acts of choice, that “there is no better or worse.” The logic of significant engagement consists in preference for, and justification of, some options over others. The inescapability of that engagement (for all agents alive and self-conscious) defeats the more remote contention that there is no such process, or that it can be escaped, or that it is merely irrational. Even the option to flip a coin (as at the beginning of a sporting match) may have a perfectly rational basis.

All the same, an agent, single or collective, may still persist in formally embracing the notion that there is no rationality or objectivity underlying moral and political claims—however much contradicted by that agent’s own reflective initiatives. One who takes the view that the evaluative question is immune to rational debate and resolution is primed to commit a category mistake. This consists in transforming evaluative propositions—these being viewed as irrational—into an alternative idiom, either of fact or logic, on the assumption (conscious or not) that factual and logical types of proposition are (by contrast) perfectly objective.

Such transformations, on the factual side, may be illustrated by ethical naturalism. Here, the egoist may contend that all agents are (as a matter of fact) universally self-interested; the egoist then (explicitly or implicitly) “infers,” from the supposed fact of universal self-interestedness, the conclusion that to be self-interested is universally right (Thomas Hobbes, Ayn Rand). Or the utilitarian may affirm that everyone, universally, is in pursuit of happiness (“fact”) and from this “infers” that the pursuit of happiness is morally obligatory. In such moves, psychology (what is) is confounded with ethics (what ought to be), description with prescription.

It matters that the formal distinction between what is and what ought to be is not disguised or elided. First, even if it is true that everyone does x , it does not follow that x is unavoidable, or that x is right. Second, if any given behavior x is uncontrollably driven by biology, and that choice of x is altogether impossible, then any question as to whether x is right—or wrong—is excluded. Third, if x is not uncontrollably driven (or given), two conclusions follow. First, the attribution of factual universality to x is false. Second, this false attribution of universality to x (where x is a human mode of behavior) betrays the purported factual claim as an empirical mask disguising moral commitment. Thus it is that evaluative propositions are commonly transformed into (or passed off as) factual or logical idioms, consciously or otherwise.

Origins and Evolution

Sociopolitical order among humans, in so far as it is not genetically imposed, must be invented (constructivism). The fact that human order is

invented makes it “artificial,” viz., a function of artifice, not nature. Artifice is not *in se* irrational. A Velcro fastener (clasp) is no less artificial than a slide fastener (zipper), but it is in certain respects far better (more efficient). In an early period, all human order, if represented as immutable custom, appears natural. But once custom comes under siege, with standing arrangements shaken to their roots—as especially in war, famine, and economic or other crisis—minds commit more self-consciously to altering rules of engagement. Some seek piecemeal change (gradualism); others promote wholesale change (revolution, utopia); others still desire restoration of the *status quo ante* (conservatism, reaction). Change takes place only against a backdrop of stasis, and stasis is notable only against a backdrop of change; the two are distinct, yet inseparable.

All human order is invented; all, technically, is “artificial.” Traditionalists and conservatives, defending existing or earlier practices, can do so only in a newly self-conscious manner (Edmund Burke). No “ism” is “natural.” At least moderns are aware (though in different degrees) that all “settled” arrangements change. If, over the last 30,000 to 100,000 years, the human species has not been much altered (physiologically), it remains that the human condition, over the same span, has been persistently subject to explosive upheaval, for which political philosophy (religious and secular) has helped to serve as fuse.

The mutation of the human condition is noted in such transitions as those from hunter band to state, muscle to machine, rural to urban, analogue to digital, local to global. The substantive concerns of political philosophy recur in all associations, stateless (horizontal/acephaly) or statist (vertical/hierarchy), if far more in the second than the first. Associations are subject to unrelenting evolution, in response to conditions imposed on humans by nature, and in response to changes imposed on nature by humans. In consequence, political philosophy grows steadily more complex, in regard to (1) internal ordering of communities, (2) order between communities, and (3) ordering of responsibilities by communities towards nature.

A peculiarity of political philosophy is that it is thus far specific to *Homo sapiens sapiens*. Enquiry even into the nature of “human nature”

straightaway becomes itself a philosophical (evaluative) question. Any specific content assigned to human nature implicitly condemns as inept those political philosophies whose implications fly in its face. If, for example, human nature is agreed to be, as a matter of fact, irretrievably selfish, then a political philosophy such as anarchism—in which wholly voluntary cooperation is promoted as the end—must be seen as a nonstarter. If, on the other hand, human nature is seen as essentially altruistic, then a political philosophy of absolutism or despotism will be read off as redundant and thus deplorable.

Whatever is claimed (factually) to constitute human nature has some consequential impact (normatively) on policies that ought to be invoked or on notions regarding how life should be lived. Nonetheless, there can be no direct inference from (a) some factual characterization of what human nature is to (b) some moral conclusion as to proper policy or behavior. But there is a negative, exclusionary logic, such that the stipulation of (a) disallows any (b) that runs contrary to (a). In sum, if the fact of human nature is irretrievably x , any governing norm that presupposes not- x must fail.

Humans, however intelligent, are nonetheless animals. Some part of the brain, and consequently thinking, remains grounded in the animal genome. The question cannot be: “Does the genetic connection exist?” The question is: “How and in what degree does it hold?” And that question is more easily asked than answered. Suffice it to say that sociopolitical order among humans, though mostly invented, is not plausibly conceived as perfectly free-floating, the outturn of an uncompromisingly autonomous intellect.

In the same way that it is unwise to assume that construction of human order is an entirely independent, rational process, so is it imprudent to suppose that no other species possess the potential, in whatever degree, for rationality. There is consciousness and self-consciousness among Pongidae (gorillas, chimps, orangutans), Cetacea (whales, dolphins, porpoises), and some Aves (bird) species. Self-consciousness is a precondition for rationality, and rationality—via language—is a precondition for normative order. Any creatures, like dolphins and chimps, in whom there exists some

non-instinctive capacity to communicate, betray likewise an element of actual or prospective rationality (Peter Singer).

Whatever may be said of other species, humans amply demonstrate this rational potential, no matter its limitations. Unlike the Capricorn beetle, honeybee, or bonito, humans are bereft of biological programming sufficiently powerful to directly impose any universally consistent socio-political order. Being markedly interdependent, yet deprived of any very tight, genetically imposed ordering, humans are compelled to fall back either upon violence (force) or suasion (dialogue) to fill the gap. Persuasion abuts upon sustained reflection—communicative rationality. Although political philosophers entertain rival views as to how genuinely autonomous human thinking is, most (today) assume that the customs, rules, laws, policies, and principles governing the human family (in its various demographics) are less the gift of nature, than of ratiocinative artifice.

Over three thousand years, a thin thread that has run through political philosophy is a quest for principles that yield, not just systems of order, but systems justly ordered. At one extreme, (1) the mix of answers reflects an ideal of resignation and submission (the Pentateuch, the Book of Job, the Qur'an, Thomas Aquinas). In between, (2) there is the call for retention of existing or customary practices (traditionalism, conservatism). There lies at the other extreme, (3) an ideal of basic rights, citizen participation, and active, corporate self-interest (see, e.g., Thomas Paine, John Stuart Mill, John Dewey, John Rawls).

The first orientation (resignation) underscores the notion of being ordered through violence or superior force, as by a tyrant, dictator, monarch, god, or god's representatives on earth. The middle orientation (traditionalism) fixes upon retaining whatever order there happens to be, or returning to any that appears to have worked in the past. The third orientation (citizen participation) commits to a polity self-ordered via discursive rationality or "communicative action" (Jürgen Habermas). This rationality may be conferred upon the association as a whole ("mobocracy," direct democracy), or be confined to some more compact body within it (republican government, representative democracy).

The positions advanced from these three perspectives can all be combined in various ways. But this broad band of possible appeals to order—object v. subject, stability v. instability, passive v. active—must be read off more as principles than as autonomic or psychological “drives” or “instincts.” The various political, philosophical, religious, ethical, and ideological orders displayed in human associations (code-switching, mimesis) would be confined to a much narrower spectrum were they merely “natural,” viz. directly imposed by nature.

Reference and Homologues

Political philosophy attends to right conduct towards the individual, society, state, global community, and environment. Human populations grow and spread, the natural environment tacks and turns, socio-political organization transitions and mutates. Correspondingly, political philosophy evolves in ways ever more complex—permeating university departments under numerous appellations. Social theory is addressed in sociology, legal and jurisprudential theory in law, leadership theory in business studies and administration, applied ethics in philosophy, public policy in political science (political studies) and economics, and so on. The hard core of the subject (sense) persists, the conditions to which it applies (reference) spatter like raindrops in a storm.

Confining attention to the academic study of political science or political studies, political philosophy, in its core aspects—normative, factual (historical and ontological), and analytical—is imperfectly shadowed by the terms (1) *political theory*, (2) *political thought*, and (3) *political ideology*.

1. Political Theory

a. *Political theory* may refer to an analytical approach. This analytic turn is variably styled “political philosophy” (Anthony Quinton, William Kymlicka, David Raphael), “conceptual analysis” or “political concepts” (Felix Oppenheim), “political argument” (Brian Barry) or “political analysis” (Robert Dahl). It tends to concentrate upon such ideas as liberty (Jean-Paul Sartre, Isaiah Berlin, Joseph Raz, Orlando Patterson), equality

(Charles Beitz, Amy Gutmann, Albert Weale), justice (Michael Sandel, Ronald Dworkin, Michael Walzer), toleration (Preston King, Susan Mendus, John Horton), power and authority (Steven Lukes, Nico Poulantzas, Peter Morriss, David Beetham, Barry Hindess, E.D. Watt), revolution (Hannah Arendt, Krishan Kumar, Chalmers Johnson), political obligation (James Fishkin, Richard Flathman, Carole Pateman), punishment (Michel Foucault, Patrick Devlin, Ted Honderich, Matt Matravers), federalism, sovereignty, the common good, influence, welfarism, hegemony, and so on.

b. Political theory, in this analytic iteration (1a), reflects two distinct approaches, though the two are rarely if ever entirely disconnected. The first is syntactic and attends to initial meanings conferred upon ideas, together with subsequent conclusions that may or may not be inferred from them (syntax, grammar). This syntactic approach explores the logic of ideas, but is not directly or immediately concerned to promote the values that may be associated with them. Nor is it necessarily an expression of moral subjectivism, relativism, or intuitionism. Examples of this approach are Stanley Benn and Richard Peters on the democratic state, Morriss on power, and King on toleration.

c. The second approach reflected in this analytic iteration (1a) is semantic. It attends to ideas or concepts more directly in light of their presumed bearing upon the world. The semantic approach (like the syntactic) is primarily committed to exploring the logic of ideas, but with more immediate regard to endorsing or opposing the values instantiated. Examples of this approach are such as Sartre and Berlin on liberty, Rawls on justice, Honderich on punishment, and Glenn Tinder on tolerance.

d. Still confining attention to the broad analytic version of political theory (1a), but now also to its political science context, the range of ideas characteristically explored here tend to engage more with state order, than with the social order—the latter being that site whence states arise, and in which they are grounded. In parallel, the political theory of political science tends to give only limited attention to norms of interstate order and to its associated “cosmopolitanism” (Kenneth W. Appiah, Charles Beitz, Daren O’Byrne, Chris Brown, Nigel Dower).

e. Political theory, in yet a third turn (in addition to 1b and 1c), may be conceived as the theoretical engine of political science. So understood, it too may present in two distinct forms, the first seeking to construct *laws*, the second (more modestly) *models*, of political behavior. The focus upon laws conveys a comprehensive scientific (empirical) concern with how political agents act, not with how they ought to act, in order to predict behavior (perhaps electoral) in some general or universal way—hence behaviorism (Charles Merriam, Harold Lasswell, David Easton). Though this Newtonian variety of political theory still enjoys some purchase, the model of science that it affirms has largely been overtaken by subsequent developments in the philosophy of science (Karl Popper, Thomas Kuhn, Imre Lakatos).

f. “Scientific” or law-like political theory (as in 1e) is increasingly likely to place a clamp on its ambitions, and to resort now more to models that

1. feature assumptions regarding the ends actually or hypothetically pursued by actors,
2. factor in conditions or identities that constrain those actors, and
3. infer conclusions from (i) and (ii) as to the strategies actors will, may, or “ought” to take (Anthony Downs, Kenneth Arrow, Russell Hardin, Keith Dowding).

In this way, political theory can aim to model decisions taken by individuals or associations, with a view either to predicting or recommending tactics, strategies, or policies.

g. The general advantage of flexible and situation-specific modeling over the rigidity of Newtonlike law-making is that the former more readily accommodates the feedback loop appropriate to rational and self-referential agency. Hence the rise of risk analysis, decision theory, game theory, and rational-choice theory, fruitfully informing methodology in political science, economics, and in social science generally. (Jon Elster, Michael Taylor, Cristina Bicchieri).

h. “Scientific” political theory (1e), launched to construct a universally predictive political science (Merriam, Lasswell), was largely designed to displace political philosophy. Thus understood, it was more an expression

of scientism than of science. By contrast, a political theory roughly constructed along game theoretic terms (1f and 1g) would have no such capacity or aim, though some arguments, like Downs's economic theory of democracy or Arrow's impossibility theorem, can be read off in an anti-normative vein.

i. Models and modeling constitute a marked improvement over the Newtonian approach of "scientific" or "behavioral" political theory. Nonetheless, in modeling, the weakest (most ambiguous) link in the chain of argumentation is the first. While models are methodologically fruitful, they may also slip into positivism by allowing the initial conditions (1f.i) to be treated more as mere matter of fact than as ethical act. In rational-choice theory, for example, the principle—viz. commitment to maximizing self-interest—may be stripped of its normative edge and thus thrown back upon (converted into) mere descriptive psychology.

j. The "moral" principle of egoism and maximization of self-interest ultimately derives from Hobbes (17th century) and Bentham (19th century) and is on the whole uncritically absorbed from them into modern economic theory either as a matter of fact or as a fundamental operating assumption. The rational-choice position is *in esse* formulated in hypothetical-conditional terms ("if x, then y"). Nonetheless, any norm converted into fact (even if "on condition") may well operate with the force of a "hidden persuader." To accept that some specific behavior is universal (like reflexive withdrawal of hand from fire) is to accept that this behavior is not subject to choice and thus renders irrelevant questions of moral agency. Care must be taken to avoid even the subliminal impression that the model can properly serve as a substitute for evaluative thinking, especially with respect to assumptions about motivations as described in 1f.iii.

k. As well as signaling logical analysis (sentactic or semantic) and scientific analysis (formulating laws or generating models), the term *political theory* (William Connolly) is often used also to signify the history of ideas, referencing the same historical content as *political thought*.

2. Political Thought

a. “Political thought” tends to signal historical enquiry, and as such is a subset of “the history of ideas” (R.N. Berki, John Morrow, George Sabine). It explores in temporal order either

1. a canon of writers or
2. a canonic set of themes as instantiated by writers.

If the concern is with (i), the level of reflection will vary as between the more methodical and systematic (Spinoza, Hegel, Rawls), the more episodic (Machiavelli, Montaigne, Madison), and the more prolix (Montesquieu, Marx, Dewey). If the concern is with (ii), then themes predominate as illustrated by key writers, again taken in chronological order. Most such “political thought,” whether (i) or (ii), attends to European and American thinkers, but is increasingly extended to other regions (Africa, America, Asia) and countries (China, India, Russia) and categories (gender, labor, race).

b. The history of ideas (and thus of political thought) figures prominently in political studies, as it does in the study of literature, art, music, architecture, archeology, and biology (evolution). Where a subject is more technical, like economics, in the sense of admitting more stereotypical answers, or aspiring to these, its history is constantly updated in the sense of being displaced. Where, by contrast, a subject is constituted by important questions, without correspondingly straightforward answers, those who seek a deeper understanding are propelled into its devious, historic back-channels. At the point where economic theory turns, and begins to question its technocratic competence, it morphs into political philosophy, as, for example, in F. A. von Hayek, Milton Friedman, and Amartya Sen (David Miller).

c. The question as to how the history of political thought may be best executed is subject to some dispute.

1. It is widely argued or supposed that old and even ancient texts have much to teach us, on the understanding that important ideas, whenever formulated, have a value that is somehow perennial (Howard Warrender on Hobbes, Simone Goyard-Fabre on Montesquieu, Hiram Caton on Descartes).

2. By contrast, some argue that there are no perennial questions, that earlier texts only address problems current when written, and that what these texts mean can only be unearthed via recovery of their historical context (Quentin Skinner, John Pocock, Richard Ashcraft). The first approach is fairly unselfconscious, the second is not, though both occasion discomfort. What both confirm, however, is the indispensability of earlier writers (historical texts) to all current and ongoing excogitation.

3. Political Ideology

1. “Political ideology” has an emphatically historical character—a variation on “political thought” or “the history of political thought”—because it attends to diverse *traditions* of political thinking, reconfiguring the history of ideas under banner headlines like conservatism, socialism, liberalism, fascism, environmentalism, feminism, republicanism, etc. This approach is characteristic of broad social movements and of political parties that entertain a program of action, backed by reasons, the latter equipped with a history—of intellectual development from past to present.
2. Political philosophy and political ideology share the same basic ingredients (value, fact, analysis), and the same distinctive concern with norms. More precisely, political ideology comes closest to political philosophy in the latter’s normative, theoretical, analytic, and semantic form (see 1c above). Yet the two diverge.
3. The object of political philosophy is to serve as a normative guide, but subject to proper understanding; its premises are engaged more as hypothesis than dogma; thus these premises, through tinkering, may change; and, given “axioms” subject to critical review, foundations are more likely marked by gradual change, not sudden, violent overthrow.
4. The immediate thrust of political ideology is also normative, but marked by a more imperative commitment to mobilize and to act; here initial premises are received as dogma; dogma fortifies axioms against critical review; and foundations that cannot be amended, likely conclude upended.
5. Both political philosophy and political ideology may be unavoidable, and even perhaps necessary; they differ nonetheless. Where the focus

is more purely upon understanding, every claim is more provisional, open to debate: there are no full-stops. Where the focus is more exclusively upon mobilization, only technical claims are provisional, the normative referent is fixed—hence axiom, scientism, creed, mission, dogma, faith. Thus the procedure of political ideology is severely axiomatic, deductive, reductive, sometimes revelatory. Religious movements (distinctively concerned with divinity or afterlife) are but a subset of ideological movements, cut adrift from situational logic, moored to immovable premises, freed from any burden of self- or cross-examination.

6. University departments often mimic the ideological approach, understood as the recuperation of diverse traditions (3a), and may devise from it a type (or types) of course, mostly inspired by one of two motives. The first is to supply a more popular and accessible alternative to “the history of political thought.” The second is to enable a more clinical dissection of the questionable *modus operandi* implicated in converting the history of political thought into its ideological alternative. And the two may blend.
7. Academic political ideology, as at (3f), raises two types of concern. First, there is the question of the degree of reliability that may attach to claims regarding the influence of any past writer, W, upon successors. Second, conversely, there is the question of the soundness of any claim laid by movement or party, P, to the intellectual legacy of some long-deceased W, who might well, if alive, repudiate the imputed tie. In this vein, it can be radically misleading to recruit Plato as a current communitarian or socialist, Machiavelli as an elitist, Hobbes as an individualist, Locke as a liberal, Rousseau as a democrat (and a green), Smith as a “free-market” celebrant, Marx as a Soviet-style, command-economy communist, or Hegel and Nietzsche as proponents of fascism and Nazism. Such insensibility provokes the just animus of historians of ideas, among them methodological contextualists (2.C.ii).

Political Science and Political Thought

The relationship between political science and political thought is shaped by misunderstandings. Many political scientists since the behavioral revolution of the 1950s and 1960s have questioned whether political thought should be understood as a scientific endeavor at all. According to their critical view, political thought has no intersubjectively verifiable methods, tends to blur the fact/value distinction, and is not concerned about phenomena and causal mechanisms in the real political world. As behavioral and empirically oriented research became hegemonic in political science in the United States and in most other countries of the Western world, the subdiscipline of political thought became marginalized in political science and found its home in departments of philosophy, history, and other humanities.

Scholars who specialize in the field of political thought have continued to complain again that they are not getting the attention and the resources (e.g., for jobs or books) they deserve. Furthermore, as noted by Timothy Kaufman-Osborne (2010) and Gregory Kasza (2010), the number of required courses in political thought has sharply declined at a rising number of colleges and universities. Political theorists are more and more concerned about the status of political thought in political science. This marginalization of political thought, however, is at least in some parts a consequence of the reluctance of political theorists to interact with the empirically oriented subfields of the discipline in a more productive and enriching way.

Evolution of Political Science

Introductory books in political science often claim that Aristotle is the founder of the discipline, citing as an example his comparison in his *Politics* of different regimes or his inquiry into the causes of regime change. One may even go further back to argue that Thucydides founded empirical research in politics in his *History of the Peloponnesian War*. As both authors are also famous for their political thought, at the very beginning of political research, there was no separation between empirical political science and political thought. This is true also for a long period in the history of political ideas; famous examples are Niccolò Machiavelli and Alexis de Tocqueville. Even in the works of such a highly abstract thinker as Georg Wilhelm Friedrich Hegel, one can find empirical observations, such as those about the economic sphere or the family. Even at the very beginning of the development of political science as an autonomous discipline in the second half of the nineteenth century, empirical research went hand in hand with political thought in the sense of normative reflections or considerations about the very nature of the political and empirical research.

That fruitful relationship changed during the twentieth century. The professionalization of the discipline has increased the demand for empirical research and findings. Theory in political science was understood as either analytical or based on observation of facts. Following a rather superficial reading of Max Weber, many scholars have been especially critical of attempts to justify normative claims in political thought. They have also opposed political thought that has obvious political roots, as in the work of Carl Schmitt, in Marxism or in John Dewey's pragmatism. The new generation of political scientists instead have favored a style of research that is seemingly neutral with regard to the "great questions"—for example, those about justice, the best regime, or the relationship between the individual and the state—that have been and still are the main topic of political thought.

Political Thought and the Behavioral Revolution

One of the sharpest criticisms of normative political thought is found in *Political Theory* (1959) by Arnold Brecht, a book that became one of the core texts of the behavioral revolution. Brecht denies any scientific worth of political thought. All theoretical utterances have to be either observation sentences, observation sentences deduced from hypothesis statements, or at most, hypotheses with a wider range that have been deduced from observation sentences. Consequently, on this understanding of political science, there is no need for political thought; what is needed is merely a political science that in generalizing observational sentences is already theoretical driven. Every claim that goes beyond such scientific research, according to Brecht and other forerunners of the behavioral movement, is simply “unscientific.” Of course, some political scientists such as David Easton and Robert Dahl joined the behavioral camp but have been much more open to a political thought with some empirical roots. Nevertheless, the mainstream of political scientists, at least in the Anglo-American world, has insisted on a strong separation between sober, scientific (that is, empirical) research, on the one hand, and a more speculative kind of political thought, on the other.

Critiques of Positivist Approaches in Political science

Eric Voegelin

The challenging counterattacks of Eric Voegelin and Sheldon Wolin against this understanding of political science had no strong impact on the hegemony of empirical approaches in political science. In his seminal book *The New Science of Politics* (1952), Voegelin argued that the contemporary practice of political science had been much too narrow and would merely duplicate political reality rather than produce true knowledge. According to Voegelin, political science as a narrowly conceived empirical discipline would not be able to address the troubling challenges of the modern world, such as Nazism, Marxism, and Western consumerism. To counter these challenges, Voegelin pleaded for an understanding of political science that is able to answer the “great questions” of human beings again; goes back to

the political philosophy of Plato, Aristoteles, and Thomas Aquinas; and therefore includes not only ethics but also political anthropology and even ontologies. In this conception of political science, empirical research, if it has any sense at all, has lost any autonomy and it is political philosophy that resides in the center of the discipline. Thus, one can see in *The New Science of Politics* some kind of mirror image of the behavioral hegemony.

Sheldon Wolin

Against the background of the highly politicized political culture of the late 1960s, Sheldon Wolin, in *Political Theory as a Vocation* (1969), opposed the seemingly neutral character of political science. Following Thomas Kuhn, he argued that the methods dominant in contemporary political research are just another scientific fashion that must be supplemented by a more historical understanding of politics and of science. The main point of his criticism, however, was to reproach political scientists for a failure to be politically engaged. Against the reduced understanding of politics and ethics of the “methodist,” he argued for the vision and engagement of the political theorists. Although Wolin’s arguments did not change the outlook of the discipline in general, they became influential stepping stones to a revival of political thought. Together with the rebirth of political philosophy in the wake of John Rawls’s *A Theory of Justice*, Wolin’s critique has led to a growing interest and even importance of political thought in the last decades of the twentieth century.

Responses to Work in Political Theory

Gunnell (1983) has described some of the reasons why the more empirically oriented political scientists have failed to recognize the contributions of political theorists to the discipline. Most scholars who specialized in political thought were not very concerned with real political problems. Their theories were often formulated so abstractly that it was difficult to identify an agenda for empirical research or even to formulate hypotheses to guide the empirical work. Think, for example, about the discussions on the proper reading of John Rawls’s *Theory of Justice*, which dominated the debates in political philosophy in the 1970s and 1980s. A related problem

was the import of discussions and intellectual fashions from philosophy of sciences, analytical philosophy, metaethics, linguistics, structuralism, and existentialism. It has often seemed that the contributions in political theory only mirrored these larger trends and were not translated into the language and the research interests of political science. Another cause for the isolation of political thought can be seen in the rise of the Cambridge School, which holds that the texts of the past must be interpreted only in their own linguistic context and are used as inspirations for current affairs. Last but not least, scholars in political thought were still producing countless books and articles about the “great thinkers” of the past such as Plato, Machiavelli, Jean-Jacques Rousseau, Immanuel Kant, and Alexis de Tocqueville, who were either repeating the insights of earlier studies or focusing on very detailed problems. As a result, work in political theory often had no impact on the interpretation of current problems in political science. At least, this has been the charge of many political scientists, a charge that might have been justified with regard to many, but certainly not all, contributions of political thought.

Political Science in the Twenty-First Century

One of the main reasons for the behavioral revolution and the decline of political thought after World War II was the belief that the great “normative issues had been settled” (Gunnell 1993, 219). The values and institutions of liberal democracy were considered to be the only legitimate ones, especially in comparison with those of the totalitarian regimes, and there was no need for any further political thought. Political thinkers from the left and from the right were still criticizing the liberal mainstream in political science, and there also had been some conceptual innovations within the concept of liberal democracy as the theory of deliberative democracy or multiculturalism; nevertheless, most political scientists simply ignored these contributions or integrated them in their framework without changing it very much.

Some scholars argue that the longstanding hegemony of liberal democracy is coming to an end. Their claim is threefold. First, there is the emerging importance of transnational and supranational decision-making bodies like the International Monetary Fund, the World Trade Organization, and the

European Union, which have weakened nation-states and therefore the power of representative institutions like parliaments or political parties. Second, the Fordist regime that integrated great parts of the population in the Western democracies during the second half of the twentieth century has been seriously eroded. The result of this development may be a rebirth of political conflicts beyond the calm waters of representative democracy. Considering the recent wave of populism in Europe and the United States, one can get at least an impression of what the future even in relatively stable regimes could look like. Third, the growing importance of non-Western countries like China, India, or Brazil in world politics not only challenges the world power system but also raises new normative questions, as, for example, with respect to the question of intellectual property or the human rights framework. This development and some other larger trends challenge the conceptual and normative framework of political science today. Obviously, there is a growing need for new theoretical concepts and ideas. Political science should no longer be glued to traditional narratives about liberal democracy.

These changes have led some political scientists to rethink their attitudes toward the subdiscipline of political thought. In recent years, political theorists have published a growing number of contributions that reconstruct political concepts of the past in different ways and make them compatible with a political reform agenda. Examples include mixed forms of government (also known as mixed constitutions), the introduction of lotteries as a substitute for some forms of elected officials, and the tribunate (or body of directly elected officials), as discussed by H. Buchstein and M. Hein (2010) and J. P. McCormick (2011). Such developments indicate that to cut the bonds between political science and with political thought would give away one of the richest resources of their discipline.

Political Sociology

Political sociology

639

640

Political Sociology

Political sociology works across the fields of politics and society. More broadly, it connects themes across power, class and elite, state and society, and social movements. It draws attention to the institutions that mediate between them and organize interests. Political sociology has become more diffuse over the last 30 years, as its own interests have shifted beyond the state and into civil society. If politics is almost everywhere, then so will political sociology be.

The tradition of political sociology can be simplified into three phases and animating concerns. In the first phase, opening in the nineteenth century, political sociology was dominated by the new phenomenon of the mass political party. In the second, coming into fruition with the Golden Age of capitalism in the 1960s, state and democracy were major themes. In the third, from the 1980s on, the new wave of globalization and neoliberal regulation saw a shift of emphasis onto new social movements and networks.

The mass political party form was pioneered by the German Social Democrats, followed by parties such as the Australian Labor Party. Early leading critics included Robert Michels and Werner Sombart, both working in different ways under the influence of Max Weber, whose ghost shadows the tradition of political sociology, as he pioneered the critique of domination and power. Michels coined the famous iron law of oligarchy, which says that in any organization, rule by an elite is inevitable. The labor

movement pursues its interests into the political arena, but the organization overpowers the ends of the movement. As Gordon Childe said of the Australian case, its victory is pyrrhic, Labor's gain, entering the state, is the loss of socialism as a goal. Michels, Vilfredo Pareto, and Gaetano Mosca viewed this as part of the process of the endless repetition of the circulation of elites. Others, like Antonio Gramsci, believed that workers could make a new proletarian order, later a new counter-hegemony. Popular struggles led to increased interest in populism.

Depression and war led to Keynesianism, the postwar economic boom, and the consolidation of the welfare state. Some, like Robert Dahl, sought to find in the postwar regime proof not of endless elites but of serious local pluralism, or the dispersion of power. Others like C. Wright Mills focused critical attention on new power elites or classes at all levels. By the 1960s, the revival of Marxism and critical theory drew new attention to the state's role in reproduction (Louis Althusser; Pierre Bourdieu) and to fiscal and legitimation crises of the state (James O'Connor, Jürgen Habermas). The issue of whether the state was essentially or circumstantially capitalist was debated by Ralph Miliband and Nicos Poulantzas. The central motif of crisis into the 1970s led to work on the state defined primarily as a crisis manager. From Sweden to Australia, new debate opened on the question of whether these developments could be usefully connected to the earlier corporatist tradition.

The new wave of globalization that made its impact felt into the 1980s shifted emphasis away from the state as traditionally defined, as that state was invariably a nation-state, and new forms of governance often were proposed to take on a larger global or regional frame. The new wave of globalization served as political license for Western states to step back from social democratic forms of regulation, although this in turn necessitated new forms of regulation. As Karl Polanyi had argued in the 1940s, markets were created by states as much as states by markets. But now the focus shifted often onto new social movements and new social media, as forms of popular struggle adopted the technology of their opponents. In this context, network analysis took on a new life in the work of Manuel Castells, who developed a theory of a "network society" made up of cultural, political, and economic elements interacting in information and communication

networks. Zygmunt Bauman argued that individuals remain trapped in the bounds of earlier, perhaps dying, institutional patterns. The dreams of democracy that were incubated in the 1960s collapsed in the 1980s, reemerging as hopes for civil society and citizenship that in turn evaporated. At the end of the story, as at its beginning, we are left with the heavy shadow of Max Weber's ghost, that of the iron cage of institutions built to make us free, which now, still, seem to entrap us. And yet, it moves.

Popper, Karl

Karl Raimund Popper was born in Vienna on July 28, 1902. In 1919, he joined the Association of Socialist School Students but left it for good shortly thereafter. In the same year he discovered Alfred Adler's "individual psychology" and Sigmund Freud's psychoanalysis, as well as attended a lecture of Albert Einstein's in Vienna. In 1928, he successfully submitted his doctoral dissertation (*Zur Methodenfrage der Denkpsychologie*) where he discussed and compared the positions of Karl Bühler and Moritz Schlick; the following year he qualified to teach mathematics and physics in secondary schools. From 1930 to 1933, he completed the draft of *The Two Fundamental Problems of the Theory of Knowledge*, which would be published only in 1979. In late 1934, he published *Logik der Forschung* that is printed with date 1935 (a revised and enlarged English translation appeared in 1959). Forced out by the political situation in Austria, in 1937, Popper accepted a post at University College in New Zealand. In 1943, he completed *The Open Society and Its Enemies*, which was published two years later in England. Part of his "war effort," as he called it, was also a series of papers in the journal *Economica*; a revised version of these articles appeared in 1957 in book form, under the title of *The Poverty of Historicism*. At the end of War World II, Austrian economist Friedrich F. von Hayek offered him a readership at the London School of Economics and Political Science. In 1949, he was appointed professor of logic and scientific method at the University of London; he became emeritus in 1969. In 1958, he was elected fellow of the British Academy; in 1965, he was

knighted by the Queen; and in 1976, he became a member of the Royal Society. He died in Croydon, near London, on September 17, 1994.

Thought

One of the most significant thinkers of the twentieth century, Popper centered his whole philosophy around the intrinsically fallible character of our knowledge. His philosophy provides a middle way between two, opposed authoritarian approaches to science and society: dogmatism and relativism. It offers an account of how scientific knowledge can be objective and rational without being certain, and without appealing to induction or grounding itself upon expert opinion, consensus, and authority of any kind. The core feature of his philosophy, in science and rationality as well as in politics and society, is that knowledge is not a form of justified belief. Critical rationalism—as Popper labeled his own philosophy, characterizing it by the appeal to reason and the role of criticism—draws attention to the relevance of attempts, as to the way in which knowledge grows, and of criticism, as to the way in which it is put to test. Growth of knowledge and criticism are closely interconnected: According to Popper, we should prefer that the theoretical system that, at any given state of critical discussion, accomplishes a growth of the possibly corroborated (that is, which has survived sincere attempts of refutation) empirical content.

Criticism, freedom, and rationality also constitute the core of Popper's view of politics and the open society. From the rejection of any form of justificationism, it follows that our actions may have unintended consequences, and this is particularly true when we seek large-scale political changes. As a consequence, we should not run the risk of making irrevocable and uncontrollable mistakes. Popper prescribed a view of science *in itinere*, for it is easy to get rid of its products (of new and imaginative theories, that is) if they prove to be wrong. Along the same line, he prescribed a piecemeal reformist activity for society: for the consequences of our actions, which are already difficult to foresee, are nearly always impossible to control. Society and politics do not primarily derive their choices or means from science but do use the scientific method. Scientific rationality and democratic government are one and the same thing: For despite its defects, only democracy provides an institutional

structure that allows for the use of reason in the political arena; democracy, that is, allows for the change of government without bloodshed.

Popper's political outlook is intimately connected to his anti-justificationism, as it emerged from the intense years that culminated in *Logik der Forschung*. Both *The Poverty of Historicism* and *The Open Society and Its Enemies* grew out of the theory of knowledge developed in *Logik der Forschung*, as well as of Popper's belief that our (mostly unconscious) opinions about the theory of knowledge and its central problems are decisive for our very attitude toward society and politics. In his eyes, the rationalist attitude—the attitude of reasonableness, that is—is very similar to the scientific attitude, to the belief that in the search for truth we need cooperation, and that, with the help of argument, we can in time attain something like objectivity.

Populism

Populism

641

643

Populism

In everyday use, the term *populist* variously connotes simplicity rather than complexity, crudeness rather than refinement, mass rather than elite appeal, and a preference for intuition and instinct over reason and deliberation. Scholarly analyses of parties and social movements regarded as populist have not always escaped the influence of these normative evaluations, leading to persistent doubts about the value of the concept for dispassionate research. Indeed, although the term *populism* has been applied to a variety of political parties and movements since the mid-nineteenth century, only in the 1960s did it begin to receive sustained attention as a political concept.

Initially, theorists sought to conceptualize populism in terms of a set of concrete political demands emanating from a distinct social base. Yet definitions based on a wide selection of cases were prone to contradictoriness, while definitions derived from a restricted set of cases were difficult to apply in comparative research. Mid-twentieth-century Latin American movements were regarded as populist because of their “irresponsible” statist economic policy and celebration of traditional values in contexts of rapid urbanization. Yet this definition could not encompass the agrarian populism of the nineteenth-century American Midwest, nor account for why Latin American neoliberals of the 1980s also attracted the epithet. In response to these difficulties, M. Canovan (1982, 12–13) constructed a typology of populisms on the basis of their various manifestations to date, distinguishing farmers’ radicalism, peasant movements, intellectual agrarian socialism, populist dictatorship, populist

democracy, reactionary populism, and politicians' populism. However, this typology—and subsequent attempts to refine or replace it—suffered from the absence of an underlying conceptualization of populism itself.

More recent definitions have sought to avoid the problems of content-based approaches by couching populism in broader and more abstract terms rather than attempting to locate its essence in policy. According to Laclau (2005, 47), populism consists in a “logic of equivalence” by which distinct and hitherto isolated popular discontents accumulate to form broad, diffuse challenges to the hegemony of the elite. This theory draws due attention to the fact that challenges to the political status quo can potentially emerge from anywhere in the social structure and represent diverse interests, thus, being broadly popular rather than class-based. However, the majority of contemporary approaches eschew its structuralist implications. Instead, they explain populism in terms of the agency of political entrepreneurs, focusing on the rhetorical construction of the antagonistic relationship between the people and the elite.

Theorists of populism as a “thin” or “thin-centered” ideology argue that all its instances demonstrate the same distinct pattern of ontological and normative claims: Populists identify the friend-enemy distinction between “the people” and “the elite” as an intrinsic characteristic of politics, and they argue that the interests of the people are more authentic and have greater legitimacy; therefore, populists justify this stance with reference to the moral superiority of the good, virtuous people over the evil, corrupt elite. Populism is thus an ideology rooted in the foundational myth of modern representative politics: the notion that “we, the People, are somehow the source of political authority” (Canovan 2005, 128). Like that of nationalism, the ideology of populism is thin in the sense that alone it does not imply a set of specific policies; instead it must combine with “thicker,” more conceptually complex ideologies to provide answers to important political questions.

The thin-ideological approach identifies the specifically *populist* features of a party's political appeal while accounting for the diversity of populism's manifestations. However, some scholars dispute the value of conceptualizing populism as an ideology, observing that populists rarely

pursue the objective of conferring greater decision-making power on the people. Rather, populism is the means by which political actors, as self-styled tribunes of the people, assert their special legitimacy to govern. It is a distinct political strategy employed to court mass appeal, involving a self-consciously folksy style of communication in which politicians employ demotic language and unpolished modes of behavior and dress, the aim being to persuade the people to vote for “one of their own.”

These actions often accompany the invocation of a “heartland”: a conception of utopian return to “a life that has already been lived” and found to be more authentic than the present (Taggart 2004, 274). The nationalist and conservative connotations of the heartland help to explain populism’s particular appeal in recent years as a strategy for parties of the radical right, including the “Tea Party” movement that came to the fore in the United States in 2010. As one populism can evoke a contrary one, the conservative Tea Party was joined, in 2011, by the leftist U.S. “Occupy” movement, which soon spread overseas to Europe and beyond. Both have claimed to represent “the people” against the elites.

Positivism

Positivism

643

644

Positivism

Positivism is a philosophy that argues that only the scientific method can yield reliable knowledge, and that this method should be applied to social phenomena as well as to the natural world. This perspective was developed during the 1920s and 1930s in the form of *logical positivism*, which maintained that apart from mathematics and logic, sensory perception was the only source of knowledge, and all concepts must either be derived from observation, or capable of being translatable into statements based on observation. However, positivism is most closely associated with the nineteenth-century French theorists Henri de Saint-Simon and Auguste Comte, and their followers. In their writings, a theory of knowledge and science was integrated with a philosophy of history and a program of political and moral reconstruction.

This form of positivism received its most systematic and influential formulation from Comte (1798–1857). In his *Course of Positive Philosophy* (1830–42), Comte argued that knowledge evolves through three states. In the first “theological” state, phenomena and events are explained by the agency of supernatural forces and entities. In the second, “metaphysical” state, supernatural agencies are replaced by the action of abstract forces residing in matter. In the final, “positive” state, causal explanations are replaced by the search for laws governing the relations among observable phenomena. In the first two states, reason is dominated by imagination; in the third, the situation is reversed. Although observation was of fundamental importance, Comte’s positivism did not reduce knowledge to

sensory perception but regarded it as the product of an interaction between experience and innate mental faculties.

Whereas the natural sciences had all reached the positive state, the science of society—sociology—had yet to become fully positive. Sociology, however, was urgently required to end the political instability and moral anarchy that had plagued Europe for several centuries. Comte argued that the theological-military regime that had once dominated Europe had been irrevocably destroyed by the development of industry and the emergence of the positive sciences. The metaphysical doctrines of the sovereignty of the people, freedom of conscience, and individual rights had played an essential role in this destruction, but they were negative in their effects and incapable of guiding the sociopolitical reorganization required by modern industrial and scientific civilization and must now be abandoned.

In his *System of Positive Polity* (1851–54), Comte provided a detailed account of the polity of the future. Parliaments would no longer be required, and administrative and judicial activities would eventually be performed by leading industrialists, although until these had been socialized into abandoning their egotism and materialism, outstanding proletarians should occupy the highest positions in a temporary “republican dictatorship.” Spiritual (moral and intellectual) authority, which was essential for social stability through its educational and scientific activities, must be separated from the temporal (political) power, and would reside in a “sociocracy” of positivist sociologists. Comte recognized that an effective moral consensus must contain a powerful emotional element and elaborated a “Religion of Humanity.” This was a religion without a god, celebrating humanity and the achievements of its outstanding scientists and artists. He described in detail the rites and ceremonies of this new religion, in which women would perform the crucial roles of educating the young and “feminizing” male rationalism through their spontaneous altruism. Comte regarded the nation-state as a temporary form of political organization to be superseded by a Europe comprising regionally organized republics, united by the Religion of Humanity that would ultimately provide the moral foundations for a “universal Republic.”

The legacy of Comte's positivism is complex. His philosophy of science has attracted a great deal of criticism, e.g., for its rejection of causality and its restrictive conception of scientific method. Comte's political theory has been condemned for the authoritarianism implicit in the dismissal of individual rights and liberty of conscience, and for its prescriptions concerning the roles of the sexes, while parliamentary democracies, contrary to Comte's predictions, have proved capable of forming stable political systems.

Yet the defects (and, at times, absurdities) of Comte's positivism have to be weighed against some lasting contributions. Comte not only coined the term *sociology* but also has influenced the philosophy of science, political practice, and social theory. Philosophers and scientists have argued that the sciences increase in complexity from the natural to the social sciences and that the latter influence the former, which was Comte's position, while Albert Einstein reminded his fellow physicists of Comte's argument that observations were influenced by, rather than independent of, theories.

In the sphere of politics, Comte's impact was by no means confined to authoritarian movements. In France, for example, his argument that social science could guide political reconstruction was certainly claimed by the reactionary and anti-Semitic Action Française, but it also inspired some of the intellectuals and politicians who founded the democratic Third Republic.

Finally, although few, if any, social theorists would now refer to themselves as "positivists," the social sciences are nevertheless indebted to some of Comte's ideas. Although hostile to the psychology of his day, Comte was a pioneer in the sociology of the emotions in his focus on subjectivity and in his efforts to integrate the study of reason, emotion, and action into a sociological framework. Moreover, he explored the cognitive functions of early religion, arguing that animism provided a spontaneous, innate means of overcoming the vicious circle of the need for observations to construct a theory and the need of a theory to enable observations to be made and organized. For these reasons, Comtean positivism is likely to remain of interest to social scientists, historians, and philosophers of science.

Postmodernism and Political Theory

Postmodernism and political theory

644

647

Postmodernism and Political Theory

Often invoked but seldom carefully defined, postmodernism has frequently amounted to a derogatory umbrella term covering a number of contemporary thinkers who can trace their intellectual lineage to Friedrich Nietzsche's critique of the modern condition and the value modernity places on truth, order, and rationality. Those who have been called "postmodernists" include Nietzsche, Martin Heidegger, Theodor Adorno, Jean Baudrillard, Jacques Derrida, Michel Foucault, Jean-François Lyotard, and Richard Rorty. Readers familiar with their writings will know both that these thinkers disagree in fundamental respects and that only some of them accept the label while others explicitly reject it. Foucault, for example, maintains in an interview in *Politics, Philosophy, Culture* (1987, 33–34) that he does not understand what is meant by the term "modernity," let alone by the "postmodernity" that is supposed to reject it. On the other hand, Rorty embraces what he calls a "postmodern bourgeois liberalism" available to a few "lucky" advanced Western societies, but these societies are precisely the kind criticized by Lyotard from a position that calls itself "postmodern" and by Foucault from a position that refuses the term. Furthermore, in *Contingency, Irony, and Solidarity* (1989), Rorty distances himself from Foucault, with whom he says he has fundamental political disagreements, while aligning himself with Jürgen Habermas, probably the most vocal critic of postmodern thought, Rorty stating that he and Habermas have "merely" philosophical differences concerning how their shared political views are justified. Similar disagreements and differences

between Foucault and Derrida, Baudrillard and Foucault, and others placed in the postmodern camp illustrate quite well the problems that arise from using the term in the loose way it is still frequently used today.

General Traits, Approaches, and Criticisms

The general definitions of postmodernism that can be and are provided in large measure focus on what it is held to oppose. Among the ideas usually associated with it are “anti-foundationalism” (rejection of traditional philosophical justifications that make appeals to universal and sometimes transcendent principles), “anti-essentialism” (rejection of the idea of necessary or natural truths about human beings or their world, such as there being a fixed human nature or a natural purpose in the world), “anti-representationalism” (rejection of the idea that human language and concepts can mirror, either well or badly, an independent reality), and “anti-humanism” (rejection of the centrality given to the human subject as observer, knower, actor, and sometimes master in the world). A related idea, popularized by Baudrillard but often rejected by others placed under the postmodern label, is “hyperreality.” Its common denominator with other postmodern concepts lies in its rejection of traditional ideas of truth, representation, and reality. The “hyperreal” designates a context in which mass media and high-speed information processing and communication have engendered an experience of contemporary life that is subsumed by images that have no external referent, the effect being that no distinction remains between “reality” and simulation (a simulation being an image that lacks reference to an original that it copies). It is in this vein that Baudrillard contends that the 1991 Gulf War did not take place, insofar as what was presented to Western publics was a media spectacle that was not properly distinguishable from fantasy, making the conflict an atrocity that at best masqueraded as a war. All of these critical moves align with an “anti-rationalism” often taken to be postmodernism’s most fundamental feature. Modernity is usually considered to be an epoch of Enlightenment rationalism in which theological and metaphysical understandings of the world are replaced with rational, scientific ones that allow humanity to progress toward a more democratic, emancipated, and just society. It is in this respect that Immanuel Kant defines Enlightenment as humanity’s

emergence from self-incurred immaturity. Postmodernity, then, would challenge the assumptions behind this humanist ideal of progress.

In rejecting this Enlightenment ideal, thinkers associated with postmodernism frequently stress the constructed and contingent nature of truths frequently held to be scientific or indisputable, and the way accepted principles deemed to be progressive or emancipatory are often interwoven with problematic relations of power. This relativism is well illustrated by the critical approaches of genealogy (associated primarily with Nietzsche and Foucault) and deconstruction (associated primarily with Derrida). Genealogy can be summarized as an examination of concepts, ideas, and values that aims to reveal the impurity of their origins, excavating forms of power that infiltrate ideas considered today to be true, or traces of immorality and hatred within our most cherished values. Nietzsche's genealogy of morality, for example, maintains that contemporary ideals of democracy and equality rest on a hatred or resentment toward what is different, while Foucault's genealogy of the modern prison system argues that its apparent humaneness in relation to old forms of punishment and torture rests on the establishment of new disciplinary power relations that delineate and police standards of normality and abnormality throughout contemporary society. As suggested by its everyday meaning as a family tree or lineage, genealogy is something of a historical study. But it is best considered "quasi-historical," as it contests the idea of a historical truth that could be identified and represented. The subtitle of Nietzsche's *On the Genealogy of Morality* is "a polemic," which should indicate quite clearly the truth value he places on the story he tells there. Derridean deconstruction can be considered an approach that locates elements within discourses and texts that are incompatible with the dominant meanings attributed to them and that must be repressed, excluded, or forgotten for these dominant meanings to function. Deconstruction operates on the idea that there is a plural and heterogeneous excess of meaningfulness in language, so that the fixed meanings that are necessary for established truths and values to operate depend on a violence done to this excess. To reveal this suppressed excess, however, is not to establish some new truth in language. Rather, it is to make this plurality irreducible, so that established meanings can lose some of their sense of necessity, the result being that the precise meaning of a discourse or text becomes undecidable. This

deconstructed reality thus makes those affected by language, including listeners and readers, freer than they would otherwise have been in their consciousness of reality.

Habermas's chief criticism of postmodern thought is that it rests on a "performative contradiction," whereby it presupposes the very idea it rejects. Attacking truth as a construction, for example, asserts a universally applicable truth claim; holding that there is no Truth with a capital "T" involves making a claim to Truth. The problem is thus one of self-referentiality. In contrast, Habermas's own theory of communicative action tries to articulate necessities inherent in the nature of language and discourse that can serve as a basis for agreed-upon norms of truthfulness and validity. More generally, Habermas champions the Enlightenment project that he feels postmodern thinkers from Nietzsche to Foucault have jettisoned, holding that their rejections of Enlightenment ideals of rationality and progress rest on a refusal to accept the distinctions among moral, scientific, and aesthetic truth claims that modern rationalist philosophy has properly established. There are, of course, responses to these Habermasian criticisms. Nietzsche, for example, holds that the problem is not truth per se but the "will to truth." This will, he argues, demands that truth be universal, simple, useful, and above all, good—demands that are moral and aesthetic in nature. Foucault, Lyotard, and others similarly respond to Habermas that they do not reject reason, progress, or human subjectivity and emancipation per se but the sacrosanct status often accorded to particular understandings of them. These replies in turn point to a more general problem: That just as the term postmodernism, applying to a diverse array of thinkers, is vague and ambiguous, so too is the modern/postmodern distinction that often structures these debates.

Lyotard's Postmodern Condition

Lyotard's *The Postmodern Condition: A Report on Knowledge* ([1979] 1984) is perhaps the first use of the term in political theory. Lyotard defines postmodernism as "incredulity toward metanarratives" (xxiv), the latter being grand frameworks that organize knowledge and discourse, but he adds that incredulity toward metanarratives does not imply belief in the possibility of escaping them. Lyotard begins by noting how technological

advancements have tended to reduce knowledge to what can be digitized, and that information is now a commodity, produced in order to be sold and moving at such high speeds that it cannot be controlled by governments or other traditional centers of power. He maintains that these changes are banal and that the thesis about the effects of the information age is contestable, but he says these changes become significant insofar as they problematize dominant paradigms of knowledge and progress. The postmodern condition, then, is not simply about knowledge developing and being communicated faster, but how this change affects our trust in the ideals of knowledge and truth.

The center of Lyotard's thesis is his analysis of "language games," which are modes of discourse governed by rules. The language game of denotation, for example, involves statements in which a knower makes a truth claim about a referent to an addressee—for example, "the Earth is 93 million miles from the sun"—and rests on rules concerning how such truths can be verified. A performative language game, conversely, involves statements that carry out actions, such as when a minister says, "I now pronounce you husband and wife," and it invokes rules about when and where a speaker has sufficient authority to perform these acts. The rules of language games are not self-legitimizing, and so their justification must instead refer to other heterogeneous games that suffer the same difficulty, in the same way that one might justify following the specific rules of chess by appealing to the game's history or simply to the implied agreement between chess players to follow the standard rules. However, these appeals then beg the question of why the history or some implicit agreement should matter. Language games are thus always unstable and open to change and even sudden mutation.

Lyotard maintains that modern science, which rests on rules concerning objectivity of method and correct standards of proof, disparages the knowledge claims of nonscientific language games. Nevertheless, as it cannot legitimate its rules—one cannot demonstrate scientifically the validity of science's standards of validity—science has had to invoke a language game of narrative, and specifically the narrative of progress, to justify its dominant place in modern discourse. The "delegitimization" of science occurs as progress narratives become unbelievable; the claim that

even if science and technology do not discover the world's truth, they at least make life better, is undermined by the way this claim rests on a prescriptive language game of good and bad that differs from science's language game of truth and falsity. For Lyotard, however, this situation opens up the possibility for a "postmodern science" that would search not for stable and universal truths but instead for examples of paradox, instability, and undecidability, such as in the case of chaos theory. This postmodern science would, in turn, be suspicious and critical of ideals of consensus and efficiency, holding that consensus depends on excluding that which is heterogeneous or incompatible with established views.

In the appendix to *The Postmodern Condition*, Lyotard answers Habermas's criticisms by holding that postmodernity arises from a "loss of reality" in which established truths become problematic. The modern age, he contends, arose with the same loss of reality that followed when religious and metaphysical ideas lost their legitimacy, and in this regard the postmodern condition is not some sort of fin-de-siècle rejection of modernity, and indeed does not follow modernity at all, but instead is modernity's precondition and therefore precedes it: "Postmodernism thus understood is not modernism at its end but in the nascent state, and this state is constant" ([1979] 1984, 79). The difference between the modern and the postmodern, for Lyotard, is that while modernity decries this loss of reality and seeks new forms of assurance, the postmodern denies itself this solace and instead seeks to experiment and invent in a world where certainties have dissolved. This distinction may suggest a kind of playfulness or frivolity that is often attributed to postmodernism by its critics. For Lyotard, however, this experimentation is driven by a serious refusal of any project that would seek to reduce or reconcile the heterogeneity of language games and discourses.

Power

Power

647

648

Power

Power is one of the most frequently used terms not only in political thought but also in everyday talk about politics. In fact, it is common to associate politics with power and to view the study of politics as the study of political power. Generally speaking, the term “power,” which comes from the Latin *potere*, refers to the ability to act or to change. In political thought, the term is often preceded by the adjectives social or political.

Common language usage can refer to the power of concrete individuals, of certain social roles (presidents, teachers), of social groups (nations, classes, the people), or of more abstract notions (the power of ideas, the power of the law). Furthermore, the terms *social* power or *political* power can be used as generic terms to describe a host of asymmetric social relations, such as force, coercion, domination, inducement, or persuasion, but they are also used as distinct from these. A specialized body of scholarship in modern political theory focused on exploring the relationship between these common usages so as to better capture the meaning of power. Since the way social and political power are understood shapes the way they are studied, this specialized study of the meaning of power serves as a linchpin among normative political theory, social theory, and empirical social science.

In premodern and early modern political thought, power was mainly used to refer to capacities that stem from established, mostly formal, social roles: the power of the monarch, the parent, the slaveowner, and so on. Philosophers focused on explaining the scope of the power attached to each

role and the relationship between them and, for the most part, did not question the asymmetries embedded in the roles themselves. In contrast, modern political philosophers try to explain the power attached to various social roles. The dominant understanding of political power in modern political thought, which was offered by Max Weber, conceptualizes power as the ability to make people take action that they would have not taken otherwise. This understanding of power, often illustrated through analogies to Newtonian mechanics, associates power with a lack of choice. As such, this conception of power fits well with the liberal view that economic markets with no government intervention are free markets and with the view that the power in democratic regimes lies with the people. This view of power has been the basis of an empirical research program that was based on measuring the relationship between expressed preferences and policy outcomes. Behaviorist political scientists such as Robert Dahl relied on this conception of power to claim that there was no concentration of political power in post-World War II United States.

Critics of this research program argued that the conventional conception of power fails to capture the real dynamics of modern politics in the United States and elsewhere, and that this failure is in part the result of the shortcomings of its very understanding of the meaning of political power. Marxists argued that market interactions have to be understood in the context of the capitalist mode of production in which they are situated. They argued that structural and systemic features of society have the capacity to empower social groups, such as capitalists or wage laborers, in different ways. These structural powers shape the topography of the social milieu in which social interactions take place and the options that are available to different social players. For example, they argue that when a recently unemployed worker takes a new job for lower wage, her actions should be understood in the context of the structural asymmetries of power, even if force or coercion were not involved in the decision. Feminist philosophers argued in a similar way that the patriarchal structure of society shapes gender power relations that are inherently asymmetric.

Other political philosophers argued that the experience of free choice, be it in the marketplace or in the voting booth, can itself be the product of power relations. Power, in this view, has the capacity to shape the linguistic and

cultural mediums through which social interactions take place and within which choices are being made. Steven Lukes argued that political power sometimes operates by making people want things that are against their real interests. Michel Foucault went a step further and argued that wants and interests are always a product of power, which he took to be ubiquitous. He explored the ways in which what he called regimes of truth embedded in techniques of governance create an environment in which the experience of choice is itself manufactured. While for Foucault power produces the experience of agency, Hannah Arendt understood power as the product of collective discussion and decision-making among equals. In her view, the power of people in democracy is not simply the sum total of the choices of individuals but the product of their acting together to create shared norms.

Pragmatism

Pragmatism

648

650

Pragmatism

Pragmatism is a method for doing philosophy that originated in the early 1870s in Cambridge, Massachusetts, which developed into a school of thought. The classical pragmatists include Charles Sanders Peirce (1839–1914), William James (1842–1910), Ferdinand Schiller (1864–1937), John Dewey (1859–1952), and George Herbert Mead (1863–1931). Overall, we find in Peirce primarily a logical interpretation of pragmatism (with logic being construed broadly), in James and Schiller a psychological one, and in Mead and Dewey a biosocial one. The movement received fierce criticism, especially from European philosophers, causing it to all but disappear in the early decades of the twentieth century. In particular, James's comments referring to that truth as the cash value of our ideas suggested that pragmatism was the philosophical outcome of America's cheap commercialism. During the last three decades of the century, however, a revival took place. Key figures in the new pragmatism include Richard Rorty (1931–2007), Jürgen Habermas (1929–), Karl-Otto Apel (1922–), Hilary Putnam (1926–), and Cornel West (1953–).

Central to pragmatism is the following criterion of meaning, called the pragmatic maxim, which originates with Peirce: "Consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of those effects is the whole of our conception of the object" (Haack and Lane 2006, 138). Although similar to the verification principle of the logical positivists, the pragmatist criterion lacks the shortcomings of the latter. When applied to core

concepts, the pragmatist criterion of meaning has profound consequences for any conceptual enterprise (philosophy, physics, political science, etc.). For instance, applying the criterion to the concept of truth has resulted in a very different notion of truth, which is now generally referred to as the pragmatic conception of truth. However, even among the classical pragmatists there is little agreement on how Peirce's criterion is to be read. As Schiller once quipped, there are as many pragmatisms as there are pragmatists. Most significantly, we find with Peirce and Dewey a realist interpretation of the principle and with James and Schiller a nominalist interpretation.

Despite their inner disagreements, a distinct philosophical movement, or school, can be discerned. Taking a strong anti-Cartesian stance, pragmatists reject the dualisms that mar modern philosophy, and they reject the modern quest for an absolute foundation of our knowledge. The result is a thoroughgoing reconstruction of philosophy. Most importantly, pragmatists reject the longstanding sharp separation between theory and practice, which resulted in an impotent skepticism-prone "spectator theory of knowledge" (Dewey's phrase). In its stead pragmatists seek an intimate connection between meaning and action: For a concept to have meaning, it must conceivably make a difference in practice. Other key dualisms pragmatists reject are the mind-body dualism and the dualism of individual versus society. The pragmatist's rejection of dualisms is related to their naturalized conceptions of mind, self, and knowledge, and to their application of the principle of evolution, not only when explaining the origin of thought but also when describing its development. Pragmatists consider themselves empiricists, but compared with their predecessors, they maintain a broader and more fundamental conception of what counts as empirical data. For that reason James speaks of a "radical empiricism." The pragmatists reject skepticism (that we can be wrong about all our beliefs) but embrace fallibilism (that we can be wrong about any single one of our beliefs) and a critical common-sensism.

The pragmatism that emerged after its revival is generally referred to as *neo-Pragmatism*. Neo-pragmatists, largely following Rorty, tend toward nominalism and relativism, relating meaning and truth to what allows us to carry the conversation forward. Rejecting the charge of relativism, neo-

pragmatists prefer to speak of our ethnocentric predicament. In practice we cannot but privilege our own community, with its epistemic standards, even though there is no noncircular justification for doing that. The term *new pragmatism* is used for philosophers, such as Hilary Putnam, who seek to distance themselves from the Rorty-inspired neo-Pragmatism. New pragmatists accept a more robust notion of truth, holding that there is such a thing as “getting it right,” so that merely aiming for the approval of our peers (that is, for solidarity), which Rorty argued is all we can strive for, is not enough.

Some parallels can be drawn with other schools of thought. Pragmatism, like Marxism, sees the aim of philosophy no longer as a matter of pure thought but as one of action. Moreover, like Marxism and existentialism, pragmatism sees the world, and humans themselves, as unfinished. For the pragmatist the universe is open-ended: what will, might, or can happen cannot be determined in advance.

Progress

Progress

650

651

Progress

Progress is a complex idea that has bearing on philosophy, politics, social theory, and history. It is linked to the “progressive” political tradition that has been associated with social democracy and egalitarian liberalism. As far as modern political thought is concerned, progress as an idea is primarily a product of the Enlightenment and became connected to classical liberalism largely through the work of John Stuart Mill and Herbert Spencer. Auguste Comte has also been very influential in the development of the idea of progress, owing to his arguments that society is evolutionary and that positivism provides a means to understand society in a scientific and rational manner. Philosophers have engaged with the idea of progress and the question of whether or not philosophy is moving forward as a discipline by solving problems.

Both the American Revolution and the French Revolution prompted theoretical discussions of the importance of progress in consideration of whether a better society and political system could be constructed. Rationalism and faith in the potential of technological advancement played an important role in such revolutionary discourse. During the Scottish Enlightenment, Adam Smith in particular critiqued the preexisting view that considered wealth creation to be a zero-sum game, arguing instead that the potential for the advancement of wealth was unlimited. This view had significant repercussions for political economy and has been lauded by some later economists and historians as the idea underpinning the step-

change moment in capitalism away from mercantilism toward free markets and laissez-faire.

Progress and its antithesis, decline, were the dominant ideas in history and politics between the Enlightenment and World War II, despite some disagreement on what exactly constituted progress and whether it could be measured quantitatively. Faith in inevitable progress was rocked during the middle years of the twentieth century by a series of events. First, the Great Depression dented confidence in economic progress in the Western world, and its aftermath saw the emergence of managed capitalism. Moreover, the rise of extremist parties in Europe, World War II, and the Holocaust during the 1930s and 1940s made social progress and its promises of greater freedom and the ability of individuals to shape society in a positive way appear unfulfilled.

The rise of neoliberalism as a political force in the 1980s and beyond corresponded with a return of the belief in progress, although it was now tied more to the individual than to society at large. At the same time, postmodernist thinkers argued that progress was an illusory idea and had been measured only in narrow ways. Postmodernism, in rejecting the possibility of a grand theory explaining history, questions not only whether progress has occurred but also whether it can occur at all. In turn, other thinkers have responded to the postmodernist critique by attacking its relativism and lack of empiricism. Marxist and Marxian theorists have been especially prominent in the anti-postmodernist discourse.

Progress and Political Thought

Progress and liberalism have gone hand-in-hand for the majority of the latter's existence as a body of political theory, a link that has been especially prominent during the capitalist era. The idea has, however, been interpreted in various ways by the various different strands of liberal thought. Classical liberals and neoliberals have tended to consider progress as an individualist phenomenon, emphasizing the Smithian idea that self-interest has unintended benefits for society at large through economic growth in particular. Social liberals, such as the New Liberals, have instead interpreted progress as a societal force, leading them to embrace

collectivism and a more egalitarian approach to political questions. Comte and Spencer have historically been especially important influences on the evolution of this strand of thought, and for the most part, social democrats have interpreted progress similarly.

Marxism has also had a prominent place in the historiography of progress. Karl Marx argued that history consisted of a series of stages defined by their dominant mode of production. This system of “historical materialism” was attached to Marx’s political schema and to his prophecy that capitalism would be replaced by socialism and eventually communism. This sense of the inevitable progress to socialism has been a powerful force in politics, although it has also been much revised (especially by democratic socialists). Theodor Adorno and Max Horkheimer’s development of the “negative dialectic” to explain the possibility of a return to barbarism has had a significant critical impact on present Marxist thought and its treatment of the idea of progress.

Conservatives, in contrast to liberals and Marxists, have had an ambiguous relationship with the idea of progress. Historically they have emphasized tradition and maintenance of established order as key concerns and therefore appear anti-progressive. More recently, however, many conservatives have embraced the neoliberal idea of economic progress, and some have also tried to present themselves as socially progressive too, indicative perhaps of the strength of progressive political arguments in the West.

Property, Theories of

Property, theories of

651

654

Property, Theories of

Property is one of the principal constitutive features of all developed societies, and it has been a key issue for political thinkers ever since the time of the ancient Greeks. Although in everyday usage, property is often identified with things which can be owned, in fact it always describes a relationship (often a legal relationship) between persons (or other legal entities) over an assemblage of rights to the use of things (some of which, as in the case of intellectual property, are very much immaterial). Very few people have ever argued for the abolition of *all* property. Much more typically, the argument has been about what sorts of property relationships and what sorts of social practices are just, efficient, and equitable. The key question surrounding property has always been this: who controls which resources and why?

Greeks and Romans

Almost all property talk is closely tied to the idea of law (whether divine, natural, or positive) and to the idea of historical continuity (almost all arguments for private property require that something quite specific must have happened in the knowable past to make it legitimate). Of especial significance in the story of property in the modern West are the twin influences of the Christian Bible and Roman law. Of course, much turns upon the (very variable) ways in which these sources have been interpreted but they certainly constitute a widely shared resource. And, insofar as one

of the trends in the West since 1750 has been to “secularize” property talk, it is clear that often unacknowledged traces of a Romano-Christian heritage remain. In fact, the origins of modern Western property thinking can be taken back still further to the work of Plato and Aristotle.

Although Plato’s view of how property should be organized in the best and/or the best-possible state is nuanced, he is certainly a source for the continuing suspicion that property in the hands of private individuals is likely to be a source of conflict and division. Aristotle, by contrast, is one of the first to articulate what are perhaps the most important claims made about the practical advantages of privately-owned property (which we can find repeated right down to the present). He identifies five key strengths of a private property regime:

1. it avoids quarrels and complaints about access to resources,
2. it leads to improvement in the care devoted to property,
3. it facilitates friendship,
4. it fosters natural pleasures, in particular self-love, and
5. it makes possible the exercise of virtues such as generosity and moderation.

Aristotle is also perhaps the first to give clear expression to another idea familiar to moderns, the identification of “the tragedy of the commons”: that, without the designation of private owners, common resources will tend to be over-exploited to a point which is in no-one’s interests.

It is to Cicero, writing in the last years of the Roman Republic, that we owe the first clear articulation of the claim that the state comes into being to protect the *prior* rights of private property holders and that this is indeed the primary function of the law. This came to be a commonplace of the Roman Law as expressed in the *Corpus Iuris Civilis* prepared under the Emperor Justinian in the sixth century (*Justinian’s Institutes*, 1987, 535). Here it was said that “Justice is the constant and perpetual desire to give to each one that to which he is entitled.” This authoritative definition was to be repeated through the ancient and medieval world and on into the modern period. It is also to the Roman law that we should look for the clearest statement of the claims of *first occupation* (that property title should be granted, exclusively and in perpetuity, to the first occupier of any land or resource), a

supposition that continues to do an enormous amount of work in the contemporary world of property (consider, for example, the jurisprudence that surrounds the claims of aboriginal peoples around the globe against majority communities of incomers).

The Bible and the Christian Church

The Christian heritage is more ambiguous. For at least a millennium and a half, the Christian church was an authoritative source of moral and political values throughout the West. From humble origins, it had come, by the end of the medieval period, to be the single largest property-holder in Western Europe. The testimony of the Bible and, particularly, the reported teachings of Jesus Christ were troubling for the established church. Questioned by a rich young man, Jesus had famously said that it was easier for a camel to pass through the eye of a needle than for a rich man to enter the kingdom of heaven. Although there was (and is) an ongoing Christian tradition that denounces material possessions, the teaching of the mainstream church was that it was avarice and not possessions that were sinful. Given Man's corrupted nature, property was necessary (maybe not sinful, but certainly not a work of perfection). Two things followed: that one should use one's wealth to do good works (this being supposedly the example set by the church itself) and second, and quite crucially, that there was a sense in which one's *superfluities* (that which was more than one needed to support one's self and one's duties) belonged to the poor. In the hands of Thomas Aquinas, writing in the thirteenth century, private property was a legitimate addition to the God-given natural law, though it was always liable to be over-ridden by God's prior commitment to the preservation of all men. Although the established Church was quite fully reconciled to the legitimacy of private property, the "heretical" claim that private property was sinful made frequent and embarrassing reappearances throughout the history of the church in Western Europe (notably in the battle over Franciscan poverty in the fourteenth century, in the mobilization of the Anabaptists in the sixteenth, and the practice of the Diggers in the seventeenth centuries).

Locke

In the early modern period (in this instance the second half of the seventeenth century), the single most influential thinker on property is almost certainly John Locke. Locke and his arguments, or at least what are widely imagined to be his arguments, are still very widely invoked, especially in North America (in the work of Robert Nozick and Richard Epstein, to take two prominent examples). Locke wrestled with a problem that had perplexed nearly all Christian political thinkers: since God had gifted his creation to the whole of humankind (this was a commonplace which Locke, with most others, accepted), how could this have been transferred into private ownership except and unless this was sanctioned by the whole of humankind, thus dispossessed (which consent Locke deemed to be impossible)? Locke's (in)famous response was that since I own myself (though our relationship to the previous owner of our selves, God, was not quite clear) when I labor upon that which God has gifted to humankind in common I "mix my labor" with what has previously been common and, *in so doing*, I make it my own. There were limitations upon my appropriation (I must not allow that which I had appropriated to go to waste, I must leave "as much and as good" for later appropriators etc.) but these limits did not relate to my "share" of a pool of common resources. So long as I did not breach the provisos, there was no real limit to what I could come to own. Locke's account seemed deeply problematic to many of his contemporaries as it does even to some of those who want to sponsor what is essentially a "Lockean" defense of private property now (again, Robert Nozick is a good example). But this has never prevented Locke's views from doing an extraordinary amount of justificatory work in the rise of a profoundly unequal liberal capitalist social and economic order (globally, but, above all, in the United States).

After Locke

In the period that followed, Locke's ideas (or ideas very much like them) were extremely influential; especially the claimed status of the first occupier and the assertion that all value was created by labor (which was sometimes read in a much more radical way than Locke had imagined or intended). In the work of Jean-Jacques Rousseau (whose own thinking on property is notoriously ambivalent) and a little later in Immanuel Kant, we find a reinstatement of the insistence that legitimate property can only be

the product of a general social agreement (and that all property prior to this is “provisional”). In Johann Gottlieb Fichte and Georg Wilhelm Friedrich Hegel, we find the view that the property of individuals must be subjected to some broader form of social (that is, state) regulation if it is to satisfy the reasons which alone can justify the existence of private claims upon finite resources.

A rather different view was taken by David Hume, the leading philosopher of the Scottish Enlightenment, writing in the first half of the eighteenth century. For Hume, the property order was just whatever had happened to get itself established and worked. It was likely that the historical process through which current distributions of property had become established was violent and rapacious—certainly, there was no question of its being just (and, indeed, no way of knowing if it had been just). A society of private property worked; it promoted the sciences and the arts. It was better for everyone (including the poor) that it should continue and, for this to happen, we needed laws which recognized and secured the stability of existing patterns of distribution. We find echoes of this argument in the utilitarian defense of the security of property developed in the early nineteenth century by Jeremy Bentham. In this instance, Locke was rejected but in order to draw quite conservative conclusions.

Marx

This was not, of course, the case with Karl Marx. Although Marx does mention Locke, he is really speaking to the account of a slightly later generation of political economists including David Ricardo and, perhaps above all, Adam Smith. Property is a category that is central to Marx’s understanding of the social relations that underpin humankind’s productive life and, within this and most crucially, in his analysis of capitalism. In any and every historical epoch, property expresses the relationship between those who produce value for society and those who expropriate that value. It is this relationship that defines the principal contending classes in any given mode of production and which establishes that the relationship between them must necessarily be antagonistic, a conflict over the claiming of the value produced by the labor of the subordinate class. Capitalist property is just the previously appropriated labor of the working class. For

Marx, the origins of capitalist property lie not in the industry or the frugality or the inventiveness of individual capitalists but in the violent expropriation of the previous property holders (mostly peasants) forcing a now propertyless working class into selling its labor power to the owners of capital who extract surplus value from the deployment of the former's labor power without due compensation. When Marx proposes "the expropriation of the expropriators," he is not proposing the elimination of all property. In the *Communist Manifesto*, he writes, "we by no means intend to abolish th[e] personal appropriation of the products of labor, an appropriation that is made for the maintenance and reproduction of human life, and that leaves no surplus wherewith to command the labor of others" (Marx, *Communist Manifesto* in *The Revolutions of 1848*, 1973, 81).

Under a number of imperatives, in the twentieth century ideas of property became increasingly decontested. In a famous intervention, Thomas Grey even argued that we should stop talking about property altogether because in a world of increasingly complex legal relationships between people about the use of things, "property" is an unhelpful umbrella term that no longer connotes anything distinctive in the world around us. But a world of increasing inequalities of wealth and income and depleting natural resources is perhaps the wrong time and place to abandon our interest in property.

655

Proportional Representation

Electoral systems of proportional representation (PR) seek to ensure that the share of seats a political party wins in the legislature closely matches its portion of the popular vote. There are many types of PR systems. Party list, additional-member, and single-transferable-vote are the most often used variants. However, all PR systems share two basic characteristics. First, they use large multimember districts—where five, ten, or more seats may be contested—instead of single-member districts. Second, PR systems are not winner-take-all. The multiple seats are awarded according to the proportion of the popular vote won by each party. In a ten-member district, for example, if a party receives 30% of the votes, it receives three of the ten seats.

Proportional representation was invented in Europe in the mid-nineteenth century as an alternative to plurality and majority elections—winner-take-all systems in which only the candidates with the most votes win office. The system described by Thomas Hare as modified by John Stuart Mill in *Considerations on Representative Government* (1861) became one of the best known proposals of the period. As suffrage became universal and mass political parties began to emerge, there was an increased desire to ensure that a party's representation in the legislature corresponded to its strength in the electorate, something that plurality-majority systems could not guarantee. By 1920, most countries in continental Europe had adopted PR. That trend continued throughout the twentieth century, with most emerging

democracies in Eastern Europe and the former Soviet Union adopting proportional or semiproportional electoral systems.

There is no disagreement among election experts that proportional representation produces fairer and more accurate representation for parties. Plurality-majority systems routinely distort representation. The largest party typically gets many more legislative seats than it deserves based on voter support, with smaller parties being underrepresented or denied representation entirely. In Massachusetts, for example, the Democrats habitually win all seats in the state's U.S. House delegation even though Republicans make up almost a third of voters.

However, there is considerable disagreement about whether the effects that PR has on legislatures are desirable. Because PR allows representation for several large and small parties, it tends to produce multiparty legislatures in which a coalition is often necessary to amass the majority of votes necessary to pass legislation. In contrast, plurality-majority elections tend to encourage two-party systems in which one party usually wins a majority of legislative seats and is able to make policy all by itself. However, policy deadlocks can still occur in such systems when the legislature's two houses are divided between the two parties, or the legislature and the president are of different parties.

Opponents of PR typically argue that one-party governments tend to be more stable and long lasting and suggest that coalition governments are liable to be weak and prone to gridlock. Italy and Israel are often cited as examples of these problems. Coalitions are also thought to be less accountable to the public than one-party governments and to give too much power to small parties. Michael Pinto-Duschinsky (1999) maintains that some parties become semipermanent members of coalitions for decades and are difficult to throw out of office. Ferdinand A. Hermens (1941), writing during World War II when fascism and communism were threatening Europe, argued that proportional representation could give encouragement to extreme parties of the left or right and allow them to gain legitimacy by getting a foothold in the legislature.

Proponents of proportional representation reject most of these criticisms, arguing that the vast majority of countries that have used PR have had

stable and efficient governments and have not been plagued by extremist factions. Proponents also maintain that PR produces more inclusive legislatures—ones that better reflect the variety of political groups and the range of political views in a society. Arend Lijphart (1999) argues that legislatures with multiparty ruling coalitions embody a form of “consensus democracy” that encourages power-sharing, bargaining, deliberation, and compromise in the policy-making process. G. Bingham Powell’s research (2000) found that these power-sharing coalitions have a clear advantage over single-party majorities in creating policy congruence between citizens and legislators. This quality suggests that policies coming out of PR legislatures tend to be more democratic in that they are closer to what most people want.

Other proponents (such as Douglas Amy [2002]) have claimed additional advantages of proportional representation, including increased voter choice at the polls, higher voter turnout, increased election of women, fairer representation of racial and ethnic minorities, and the virtual elimination of gerrymandering—the manipulation of district lines for unfair political advantage.

Proudhon, Pierre-Joseph

Proudhon, pierre-joseph

655

657

Proudhon, Pierre-Joseph

Pierre-Joseph Proudhon (1809–65) became famous in 1840 when his book *Qu'est-ce que la propriété?* attacked the idle rich and defended anarchism. Best known during his life for his “mutualist” socialism, his writings remained a touchstone for opponents of Marx in the First International, for Italian, Swiss, and Spanish anarchists in the late nineteenth century, and for federalists and syndicalists in subsequent eras.

Proudhon was born in a modest neighborhood in Besançon, France, although he spent much of his youth in the countryside of the Jura. He was proud of his humble origins but was a precociously bright youth and won scholarships to attend classes in Besançon and Paris. He always insisted, however, that his real education took place in the workshop, where mental tasks were joined with manual dexterity, practical application, and working-class solidarity. As a young man, he worked as a printer, and for several years (1836–43), he and some partners operated a printing house that lost money and left him in debt. Subsequently (1843–47), he worked at a Lyon shipping firm, which exposed him to manufacturing and business practices.

Proudhon became famous for his numerous publications that contained biting satires of the wealthy, trenchant analyses of socioeconomic inequities, and indignant attacks of coercive, bureaucratic, authoritarian institutions. His provocative retort to the question posed by the title of his 1840 book *What Is Property* was “It is theft!” In fact, his position was not as radical as this memorable epigram might suggest. Proudhon attacked the

forms of property that generated an income but required no labor, such as the interest and rents that filled the pockets of the parasitic “idle class.” He was careful to distinguish this “property” from “possessions” (that is, the land and tools necessary for a modest income), which he defended.

Equally provocative was his embrace of the label “anarchist” in the same book of 1840. Proudhon wished to replace government institutions ruling “from above” with associations organized “from below,” but he did not advocate violence or revolution. He called for society to be animated by a social morality that would lead humans to recognize the dignity of their fellow citizens and to put aside their personal interests for the larger social good, what he referred to as an “immanent” morality that, in effect, combined a secularized version of Christian morality with a modified version of republican virtue.

Proudhon’s “anarchist” attack on property was part of his larger proposal to create “progressive associations” for the educational and economic benefit of workers, and for the general and peaceful transformation of society. He believed that associations controlled by the workers themselves, and that combined work and education, would promote fraternal ties and economic efficiencies. These associations would be able to push aside idle “property owners” who inappropriately skimmed off profits and, in addition, introduce a “fair” evaluation of goods, based on labor and not on the “arbitrary” system of supply and demand. Unlike other “associative socialists” in France at this time, Proudhon insisted that government intervention be minimized and ultimately eliminated. There should be no government ownership of property and no centralized decision making. In 1846, Proudhon referred to this formula for socioeconomic justice as “mutualism.” Since this time, *mutualist anarchism* and *mutualist socialism* have referred to an antistatist agenda of nonviolent socioeconomic transformation that is centered in the action and coordination of autonomous workers’ associations. The masthead of one of his papers stated his goal clearly: “What is the producer in actual society?—Nothing. What should he be?—Everything.”

Proudhon was active politically for a brief period during the French Second Republic, and even tried unsuccessfully to establish a “Bank of the People”

in 1849. But his attacks of the new president of the republic, Louis-Napoleon Bonaparte, got him thrown into prison for three years and ended his short political career. He also spent some years in exile after the 1858 publication of the book he considered his best, *De la Justice dans la révolution et dans l'Eglise*. But it was his writings, not his actions, which made him famous. As one commentator put it, when Proudhon found himself with pen in hand, he had a fit of eloquence.

Psychoanalysis and Political Thought

Psychoanalysis and political thought

657

661

Psychoanalysis and Political Thought

Psychology, in its various guises, is concerned with the psychic characteristics and capabilities of human subjects both as individuals and as members of groups, institutions, and societies. Political thought has always made assumptions about human psychology. However, with the development of psychology as a clinical and academic field, political and social theorists have frequently turned to one or another psychological theory to supplement their analyses of political life. Psychology has been turned to in order to fill a gap in analyses that relies unduly on either simple assumptions about the strength of human reason or, alternatively, that treat human subjects as structural or cultural dupes or dopes, by presuming a thoroughgoing determination of subjectivity by the economy, the culture, or any other structure. This corrective turn is most apparent in the take-up of psychoanalysis, which, almost since its inception, has been turned to by a sequence of major social and political theorists interested in analyzing political life without eclipsing the complex psychology of the human subject. Psychoanalysis is the psychological theory that has been of most significance for political thought, as it addresses the human subject as a person who both reasons and rationalizes, who is driven by passions, and who forms passionate attachments to institutions, ideologies, and ways of life.

Although political thought addresses political life in its multiplicity, the recurrent master theme has been a concern with the problem of order, its maintenance, and sometimes, its transformation. Psychoanalysis also

addresses this problem of order, ordering, and occasional transformation by focusing on aspects of both the individual person as a reasoning, desiring, and socialized subject who is also discontented, and on groups, institutions, and other collectivities, including the nation, as powerful influences on human subjectivity. The pre-history of the pioneering approach of Sigmund Freud in this area lies largely in the group or “crowd” psychology of Gustav Le Bon (1841–1931), whose *The Crowd. A Study of the Popular Mind* (1895) emphasized the destructive power of the masses as evidenced in the violent outbursts which characterized key phases of the French Revolution of 1789. To Le Bon the crowd expressed a collective mentality or mental unity which by a process of contagion weakened individual judgment and inhibitions and unleashed the savage destructive instincts thinly veiled by the pastiche of civilization. In *Group Psychology and the Analysis of the Ego* (1921), amongst other works, Freud would develop this conception of a regression to an instinctive state and the creation of a common or group mentality, and used it to construct a more general theory of human aggression.

Sigmund Freud

Sigmund Freud developed a complex account of the human subject as divided, decentered, and conflict-ridden. Drawing on his clinical work and his analysis of dreams, errors, symptoms, and jokes, in “A Difficulty in the Path of Psycho-Analysis” Freud (1953, 143) proposed that “the ego is not master in its own house” because of the pervasiveness of unconscious processes. Rather than being “master,” the ego is subjected to the relentless pressure of the drives seeking realization, on the one hand, and the repressive force of the censoring agency, the super-ego, on the other. These unconscious forces are beyond the mastery of the human subject, whose thoughts, desires, motivations, and reasons are typically overdetermined by unconscious psychological processes.

Freud regarded the extreme helplessness of the human infant at birth, and the consequent dependence on others for an extended period, as crucial for any understanding of human psychology. The human psyche compensates for such powerlessness by resorting to hallucination and fantasy as a source of satisfaction and defends itself against anxiety through several defense-

mechanisms, such as regression, repression, reaction formation, splitting, projection, introjection, and in a more creative vein, sublimation. The psyche also achieves a degree of organization and integration of the ego, through processes of identification. As Laplanche and Pontalis (1973, 206) put it in *The Language of Psycho-Analysis*, “In Freud’s work the concept of identification comes little by little to have the central importance that makes it, not simply one psychical mechanism among others, but the operation itself whereby the human subject is constituted.” The instincts or drives, which Freud understands as the psychical registration or representative of somatic processes, continually seek realization, even if in compromised form. The libidinal or sexual drive is highly adaptable regarding both its object and its aim. Caught between the demands of the drives, the censorship and aggressivity of the super-ego, and the hazards and complexities of the natural and social world, the human being is confronted by the need to accomplish the difficult task of becoming self-civilizing, self-organizing, self-policing, and self-governing. Freud, then, presents an account of the psychic life of power and authority that supplements political philosophers such as Thomas Hobbes, John Locke, and Jean-Jacques Rousseau by providing an account of the internalization of the social compact. Political and social order relies not only on force or reason but also, and crucially, on the internalization of a social demand through processes of identification. However, this civilizing process is resented even as it is assented to, thereby generating discontents that contain a disruptive capacity.

Ideology and Political order

Erich Fromm

In an early and highly influential adoption of psychoanalysis for political thought, Erich Fromm proposed that Marxism and psychoanalysis could, together, provide a powerful explanation of the reproduction of the established form of social relations and of how social forces mark themselves on individuals and thereby orient those individuals to take satisfaction from the ideologies that operate to stabilize the social order. Drawing especially on Freud’s theory of the sexual or libidinal drive as

extremely malleable and, hence, capable of satisfaction in a multiplicity of ways, Fromm proposed “ideology” as a linking concept that successfully joined Karl Marx’s materialism of the productive forces with Freud’s materialism of the bodily drives. Within the crucible of the family a socializing process is performed that produces, along with individual variation, a common and shared subjective orientation to the established social order. In “The Method and Function of an Analytic Social Psychology” Fromm (1978, 491) termed this orientation the “libidinal structure of a society” and later termed it “social character.” He argued that the task of a (psycho)analytic social psychology “is to explain the shared, socially relevant, psychic attitudes and ideologies—and their unconscious roots in particular—in terms of the influence of economic conditions on libido strivings” (1978, 486).

Ideologies are regarded as shared fantasies that satisfy sexual desires, as a result of the extreme adaptability of the libidinal drives. For instance, authoritarian or fascist ideologies can satisfy sado-masochistic desires. This match between ideology and the socially typical libidinal structure explains the difficulty of achieving social transformation. Citizens or subjects not only believe in an ideology, even if this belief can be characterized as false-consciousness, but they also gain substitute gratification or enjoyment from the way in which the dominant ideology unconsciously satisfies their erotic desires. Hence, the “libidinal structure of a society” operates as a “cement” that binds and holds the specific social form in place by contributing “to the production of important social ideologies in every cultural sphere” (1978, 493). However, just like Freud’s account of the potentially disruptive discontents that civilization generates in its wake, when contradictions and conflicts disrupt the stability of the society, “libidinal energies are freed for new uses.” Having once been “cement,” they are transformed into “dynamite” (1978, 495).

Theodor Adorno

In Chapter VII of *Group Psychology and the Analysis of the Ego* (1955), Freud argues that “identification is the original form of emotional tie with an object” and that this way of integrating outer and inner worlds persists throughout life. Identification, understood as the internalization of aspects

of an external object—be that a person, a social institution, a cultural form, or a leading idea or ideology—establishes a relation to another by also organizing or reorganizing the subject himself or herself in accord with some aspect or quality of the other. In a group or institutional setting, a group or mass psychology can arise in which new identifications reorganize individual psyches in parallel with the psyches of other group members and in relation to a shared object, be that a leader or leading idea or ideology. As Freud puts it in Chapter VIII, “A primary group of this kind is a number of individuals who have put one and the same object in the place of their ego ideal and have consequently identified themselves with one another in their ego.”

Theodor Adorno, soon after the publication of *The Authoritarian Personality* (1991), for which he was one of several authors, published an essay titled “Freudian theory and the pattern of fascist propaganda,” which takes Freud’s *Group Psychology* as its primary reference. If Fromm takes the libido as the drive that mediates between the “the economic base and the formation of ideologies,” Adorno, writing almost 20 years after Fromm, takes identification and its potential, typically regressive, reorganization in the contemporary moment as his corresponding major psychoanalytic concept. He says of Freud that in 1922 in *Group Psychology*, “long before the danger of German fascism appeared to be acute,” Freud’s sensitivity was such that, “though he was hardly interested in the political phase of the problem, [he] clearly foresaw the rise and nature of fascist mass movements in purely psychological categories” (1991, 115). For Adorno, an ideology such as fascism achieves predominance by exploiting human psychology on behalf of the interests of a dominant class. “Psychological dispositions do not actually cause fascism; rather, fascism defines a psychological area which can be successfully exploited by the forces which promote it for entirely non-psychological reasons of self-interest” (1991, 130). These self-interested reasons concern the maintenance of a political order that distributes wealth and opportunity unevenly, typically along class lines.

Jürgen Habermas

Jürgen Habermas also relies on the concept of ideology to develop an account of political and social order and the resilience of established social

relations in which inequality prevails. In the three concluding chapters of *Knowledge and Human Interests* (1971), Habermas takes Freud's account of the dream and the symptom as distorted, intrapsychic communication as a model to also analyze how ideologies and institutions operate to both establish order and constrain freedom. As he argues:

In contrast (to Marx), Freud has acquired in metapsychology a framework for distorted communicative action that allows the conceptualization of the origins of institutions and the role and function of illusions, that is of power and ideology. Freud's theory can represent a structure that Marx did not fathom (1971, 281–82).

In this account, institutions have exchanged “acute external force for the permanent internal compulsion of distorted and self-limiting communication,” and cultural tradition is understood as a “collective unconscious” that is censored and turned outward (1971, 282). Psychoanalysis, as a theory of both psychopathological symptoms and their potential undoing, provides a model of how ideologies both constrain and organize intersubjective relations and of how these very distortions in communication may be displaced in a piecemeal fashion and the emancipatory potential of social ideals realized. Through a different interpretation of psychoanalysis, Habermas produces a more sophisticated account of what Fromm had characterized as the cement that holds together and the dynamite that blows apart the established social and political order.

Louis Althusser

In his essay “Ideology and the Ideological State Apparatuses” (1971), Louis Althusser explains how ideology plays a central role in the reproduction of a political and social order. Althusser follows Karl Marx in focusing on the reproduction of the conditions of production, namely, the forces and relations of production. Significantly, the human subject, as labor power, is included within the forces of production, and ideology operates at this level as well as at the level of the relations of production. As Althusser puts it:

The reproduction of labour-power requires not only a reproduction of its skills, but also, at the same time, a reproduction of its submission to the rules of the established order, i.e. a reproduction of submission to the ruling ideology for the workers, and a reproduction of the ability to manipulate the ruling ideology correctly for the agents of exploitation and repression, so that they, too, will provide for the domination of the ruling class “in words” (1971, 132–33).

He continues a little later: “But this is to recognize the effective presence of a new reality: *ideology*” (1971, 133).

The various ideological state apparatuses, such as the family, the school, the church, the media, and the like, are the institutions through which ideology works this effect of “interpellating” or constructing human subjects with the appropriate attitude to power and authority: an attitude embedded in a set of practices that reproduce the social order. This necessary subjection to ideology is accompanied by misrecognition, such that human subjects regard themselves as “free.” As Althusser concludes, “[T]he individual is interpellated as a (free) subject . . . in order that he shall (freely) accept his subjection . . . ‘all by himself’” (1971, 182). The psychoanalytic theory of Sigmund Freud and Jacques Lacan are drawn on by Althusser in order to conceptualize how ideology both interpellates subjects and produces a necessary misrecognition in which those subjects presume themselves to be free. Lacan’s “imaginary,” as a field of identifications involving misrecognition, is used by Althusser to explicate his theory of ideology and the political order it secures. “Ideology represents the imaginary relationship of individuals to their real conditions of existence” (1971, 162). Consequently, ideology both interpellates or constitutes subjects and leads them to misrecognize the very process of social reproduction that has determined their identity.

Slavoj Žižek

Slavoj Žižek is also concerned with how social order is maintained, even in an age of cynicism in which trust in politicians and political systems has corroded dramatically. Like Fromm, although this similarity usually goes

unrecognized, for Žižek ideology supports enjoyment, which in turn drives practices that reproduce the social order by accepting globalizing capitalism as a kind of second nature beyond transformation. A fascination with identity politics deflects a politics of class conflict. Drawing on Jacques Lacan's psychoanalytic theory, Žižek regards social antagonism as the "real" that threatens the established order and that needs to be covered over by the specter of ideology. As gaps and holes recur in the Lacanian symbolic order, ideologies cover over these gaps and seemingly suture the symbolic order back together. Ideologies raise the object of identification to a sublime position and, thereby, support both an idealization (of the nation, for instance) and a perverse enjoyment of the underside of such identifications with the nation, the ethnicity, the civilization, or the like. In this way the social ordering of capitalism survives unchallenged.

Conclusion

As the authors discussed above illustrate, political thought has been attracted to psychoanalysis by its emphasis on the significance of unconscious processes that can be exploited by ideologies and the interests they represent. In her discussion of "the psychic life of power," Judith Butler recognizes how human helplessness at birth and human vulnerability throughout life are fundamental to the ordering of human subjectivity by society, its representatives, and its ideologies. However, where Althusser presumes an irresistible ideological power to interpellate or summon subjects effectively and efficiently, and thereby settle identity, Butler presumes an ambivalent relation of the human subject to the institutions that declare his or her identity. Human subjects reiterate their subjectivity with ambivalence toward the institutions that declare and support their identities—hence, sometimes, they can do more than merely reproduce the conditions of subjection—they can alter them.

This concern with how ideologies and subjectivities can be changed, despite the powerful anchoring effects of established ideologies and the political identities they organize, is explored by Cynthia Burack in her research on psychoanalytic political theory and black feminist thought. Burack draws on Melanie Klein's distinction between the paranoid-schizoid position and the depressive position, regarded as two distinct modes of psychic

functioning, to analyze the differences between political ideologies and discourses that construct a political world of friends and enemies and those alternative ideological formations that construct the political world in a more complex manner. In the world of friend and enemy, Klein's paranoid-schizoid psychic defenses of splitting and projection are discursively available and promote conflict. In the alternative ideological formations that draw on Klein's depressive position, capacities to live with and accept complexity, difference, and ambivalence are discursively available and promote negotiation and, when warranted, reconciliation.

Psychoanalytic theory regards intra-psychic conflict as a constitutive feature of human subjectivity, and psychoanalytic practice typically concerns itself with severe and disabling instances of such intra-psychic conflict and the symptoms they generate. However, psychoanalysis is at the same time a theory of psychic reconciliation and of the capacity to learn from experience, rather than repeating self-destructive routines. It is a theory and practice of working through in which the work of mourning and the capacity for containing rather than splitting ambivalence figure prominently. This dual aspect renders psychoanalysis a powerful theory of human subjectivity and, as illustrated above, a strong contender for incorporation into analyses of political relations in which issues of political order, political change, conflict, and reconciliation figure large.

Punishment

Punishment

661

662

Punishment

Punishment is usually defined as the imposition of loss or suffering on an individual in response to wrongdoing, based on reasons, and derived from an authoritative source, usually the state, and administered through a system with due process rights for the accused. For a punishment to be legitimate, it must be justified, that is, based on coherent reasons and with clear aims, which may be utilitarian or retributivist. For utilitarian theorists, such as Jeremy Bentham, punishment should not be imposed unless the benefits to society outweigh the costs, for example, by deterring the offender and the general public from committing crimes, rehabilitating the offender so that the offender can contribute to society, or incapacitating the offender to protect the public. This approach has been a major weapon in prison reform. Retributivism, or desert theory, focuses on punishing the individual on the basis of what is deserved and appropriate to the crime, so the severity of the punishment should reflect the gravity of the crime but punishment should not be degrading. Modern retributivists such as Andrew von Hirsch emphasize punishment as censure or public denunciation. Both approaches have been criticized on ethical, theoretical, and pragmatic grounds, but both survive in modern sentencing and penal systems.

The historical development of punishment in Western democratic societies has seen a move away from capital punishment and physical punishment toward imprisonment as the major mode of punishment. The United Nations is committed to abolition of the death penalty. Torture is defined by the United Nations Convention against Torture as an act that causes severe

pain and mental or physical suffering, imposed by a person acting in an official capacity, as a means of punishment or to obtain information. Although the use of torture in the criminal justice system is prohibited under Article 5 of the Universal Declaration of Human Rights, vigilance is still needed to prevent states from using such methods, which remain relatively widespread.

Imprisonment is one of the oldest modes of punishment, although modern prisons in the United Kingdom and the United States may bear little resemblance to their eighteenth-century counterparts. The use of imprisonment has expanded dramatically since the early 1990s in both societies, reflecting increased punitiveness, efforts to combat drug crime, and longer sentences. This has led to problems of overcrowding and to criticism of prisons for simply “warehousing” offenders. This expansion has also increased the financial burdens of imprisonment. Alternatives to imprisonment for specific groups, such as female prisoners, are being considered.

A key principle underpinning imprisonment and formulated by Bentham is the principle of less eligibility, which demands that conditions in prison should be harsher than those of the lowest paid individuals in the wider society. However, increasingly this principle has been tempered by the development of rights for prisoners and the subjection of punishment systems to external regulation and scrutiny, for example, the United Nations Committee against Torture and the European Committee for the Prevention of Torture and Inhuman or Degrading Treatment or Punishment. Penal systems are assessed for their compliance with Rights Conventions, including the European Convention on Human Rights and the International Covenant on Civil and Political Rights. Rules governing the treatment of prisoners have also been formulated by the United Nations in its Standard Minimum Rules for the Treatment of Prisoners and by the Council of Europe in the European Prison Rules.

The treatment of prisoners has been challenged under Article 3 of the European Convention, the right not to be subject to inhuman and degrading treatment, and under Article 8, the right to private and family life. In the United States, constitutional challenges to prison conditions have been

mounted under the Eighth Amendment, which prohibits cruel and unusual punishment. Recent improvements in prison conditions reflect the view that the loss of liberty is sufficient punishment, and within the constraints of imprisonment, prisoners should lead as normal lives as possible. However, in response to the growth of prisoners' rights litigation, new legislation has been enacted in the United States to limit prisoners' rights to bring such claims. Although the United States still employs capital punishment, it has been abolished in the European Union and is opposed by the United Nations. Belarus is the only European nation that allows the death penalty.

Qutb, Sayyid

Qutb, Sayyid

663

664

Qutb, Sayyid

A prominent figure in the modernization of Islamic political thought in the twentieth century, Sayyid Qutb (1906–66) was an Egyptian intellectual as well as a writer, poet, literary critic, and leading member of the Muslim Brotherhood during the 1950s and 1960s. His writings developed an account of political theory based on the ultimate sovereignty of God and Islamic law. His magnum opus was a 30-volume commentary on Qur'anic concepts titled *In the Shade of the Qur'an* (1953). Some of his major contributions to Islamic political thought include *Social Justice in Islam* (1949), *The Battle between Islam and Capitalism* (1951), *Islam and Universal Peace* (1951), *Islamic Studies* (1953), *The Characteristics and Values of Islamic Conduct* (1960), *This Religion* (1962), *The Future Religion* (1962), and *Milestones* (1964).

Qutb was born into a family of rural notables with nationalist leanings during a time of increasing resistance against British colonialism in Egypt. After receiving a secular primary and secondary education, he attended Dar al-'Ulum, a modern teacher training college in Cairo. He graduated in 1933 and worked in different capacities for the Ministry of Education until the early 1950s. During this time, he was also a prolific writer, producing mainly works of literary criticism. In 1948, he went to the United States to study the American education system. Qutb was deeply troubled by what he saw as a culture of sexual promiscuity, worship of material possessions, violence, racial discrimination, and an absence of moral values. Shortly after returning to Cairo in 1950, he joined the Muslim Brotherhood. He

supported the 1952 coup d'état led by Gamal Abdel Nasser and a group of nationalist army officers known as the Free Officers Movement against the British-backed monarchy. Gradually, however, Qutb came to regard the new regime as being un-Islamic. After a failed 1954 assassination attempt against Nasser, the Muslim Brotherhood was dissolved and many of its members were arrested. Qutb was sentenced to 15 years in prison, where he reportedly endured severe torture. In prison, his writings took a more radical Islamist turn. In 1964, he was released at the personal request of Iraqi President Abdul Salam Arif but rearrested within a few months and charged with conspiracy against the state. Qutb was sentenced to death by a military tribunal and executed in August 1966. The prosecution's case against Qutb was based primarily on his later writings, particularly in *Milestones*. Although Islamic themes and concepts appeared in Qutb's works beginning in the mid-1920s, it was not until the early 1950s that he sought to develop a theory of total Islamic rupture with the established political order. In these works, Qutb described the prevailing condition in Muslim societies and around the world as a state of *Jahiliyya* (barbarism or ignorance). The term is a Qur'anic concept used to describe the condition of pre-Islamic Arabia and is understood generally to mean the antithesis of Islam. In Qutb's political thought, Jahiliyya came to represent the idea of sovereignty of the individual and the rejection of divine authority. Increasingly, Qutb came to see the postcolonial Egyptian state as an instrument for preserving the sovereignty of Nasser's totalitarian rule. Calling for a new direction, Qutb presented a political account of the ultimate sovereignty of God based on the Islamic principles of justice and morality and the concept of "the great unity" between the creator and the universe. Although his early Islamist works suggested that divine sovereignty in the form of an Islamic state would materialize organically once people are educated in Islamic ways of life, Qutb's later writings increasingly emphasized the necessity of action and the role of a devoted Muslim vanguard whose task included developing social programs on the basis of the Shari'a. His last work, *Milestones*, called on the vanguard to eliminate the reign of man and to establish the kingdom of God on Earth.

Qutb's turn to Islamist political thought was in part a result of the influence of such figures as Pakistani theologian Abul Ala Maududi, Indian Muslim intellectual Abul Hasan Ali Nadwi, and Egyptian Islamist Hassan al-Banna.

Like the contributions of many other pioneers of modern Islamic thought, Qutb's writings are said to have had a declericalization effect, challenging traditional religiosity and calling for free and intuitive engagement with core Islamic concepts. Rejecting Qutb's political account of Islam and his designation of the Egyptian society as a state of Jahiliyya, traditionalist clergy advocated obedience to the Muslim sovereign. Despite government censorship and opposition from the clerical establishment, Qutb's writings enjoyed wide readership both during and after his life. *Milestones*, which was described by the Sheikh of al-Azhar as blasphemy, became a manifesto for many Islamists during the 1970s and 1980s. Although some commentators on his thought maintain that Qutb did not make an explicit call for physical violence, more radical Islamist groups like the Egyptian Jama'at al-Muslimin and Al-Qaeda have sought to put into practice Qutbist concepts through violent measures including murder of political opponents and attacks on civilians.

Race and Racism

Race and racism

665

671

Race and Racism

Few political concepts are as fraught with difficulty as race and racism. Although race is now discredited as a biological category, and racism is the subject of widespread moral condemnation, racial categorization remains so much a part of everyday life and speech—we describe ourselves and others as “black” or “white” or as “Asian” or “Latino”—that it is difficult to imagine a world without race. The result is a complex and confusing landscape. And this before account is taken of persistent racial inequalities, discrimination, and prejudice. To understand how we have arrived on this complicated terrain, this article briefly discusses the concepts of race and racism. It then outlines the historical development of racial ideas from the eighteenth to the twentieth century, before reviewing some competing theories that have sought to explain racial categorization. The final sections discuss contemporary racial dilemmas in both theory and practice.

Defining Terms

The concept of race refers to the grouping of individual human beings according to observed physical characteristics such as skin color, face shape, or body morphology, which are believed to be naturally or genetically determined. The physical characteristics, or phenotypes, that are deemed relevant for racial classification have varied from one social context to another, although skin color has played an especially important role in the history of Europe and the Americas (but not with many

indigenous peoples such as the Lakota, whose word for white people, *washichus*, has nothing to do with skin color). Thus identified, racial groups are attributed typical behaviors, intellectual capacities, and emotional and moral dispositions, which are often viewed as fixed, bio-behavioral essences. Racial theories view races as discrete groups with determinate boundaries, which allow a person to be assigned to this or that race. Both ink and blood have been spilled in the effort to define racial groups, with sometimes absurd results. As discussed below, although it is now widely discredited, historically the identification of distinct human races has preoccupied scientists, anthropologists, philosophers, and historians. Indeed, until quite recently race was assumed to be a natural category.

Racism can be defined as the evaluation or differential treatment of racial groups on the basis of their alleged “natural” differences. For some commentators the very act of identifying racial groups is a form of racism. There is something to be said for this view, partly on the grounds that most race theorists have gone on to make evaluations or rankings of races. However, unless evaluation and/or differential treatment are included as necessary criteria for racism, many acts would have to be labeled racist in a way that blurs important distinctions between the descriptive, everyday use of common racial terms and the evaluative attitudes, behaviors, and practices that treat some racial groups as inferior to others. Since many people identify themselves and others in racial terms (e.g., “I am black” and “she is white”), but do so with no intent to either praise or denigrate, the present article follows the practice of defining racism as classificatory *and* evaluative.

Racism takes many different forms. It can involve prejudicial attitudes or beliefs, discriminatory behaviors, demeaning uses of speech, and physical violence. Thus, a brief inventory of racist acts could include a belief in the innate superiority of the “Aryan race”; an employer who prefers to hire workers from a particular racial group; a cartoon that depicts a stereotypical Jew; speech that denigrates or expresses hatred toward a particular racial group; and physical attacks on immigrants or minorities. This indicative list serves to illustrate the diversity of racist attitudes and behaviors and, hence, the complex range of moral, political, and legal issues that racism raises. Several authors have proposed typologies to make sense of this diversity.

For example, Erik Bleich (in his *Race Politics in Britain and France*, 2005) disaggregates racism into three main types: access racism (e.g., discrimination in jobs and services), expressive racism (e.g., racial hate speech), and physical racism (e.g., racially motivated violence). It is also important to note that racism is not solely a property of individual human agents. Institutions, policies, and social structures may also be defined as racist if they advantage or disadvantage different racial groups. Some examples are discussed in the following sections.

The Origins of Racial Thought

Making distinctions between groups is as old as human history. In Ancient Greece, for example, Aristotle famously distinguished between civilized people and barbarians. Although these processes of classification and denigration bear some similarities to racism, they were not based on hereditary or phenotypical differences. Scholars now agree that racism is a more modern phenomenon. Although it is impossible to date the origins of racial thought precisely, it is generally thought that European anti-Semitism during the late medieval and early modern period laid its foundations, but fully fledged racial theorizing began to flourish only in the eighteenth and nineteenth centuries.

Some of the earliest racial theorizing came from European travelers. In 1684, François Bernier was one of the first writers to use the term “race” to refer to discrete groups of human beings based on phenotypical differences. His book *A New Division of the Earth* identified “four or five species of races of men.” Subsequent writers who developed influential racial theories included Johann Friedrich Blumenbach, Barthold Georg Niebuhr, and Arthur de Gobineau.

Two defining features of modernity shaped racial thought during the eighteenth century: first, science and the Enlightenment; and second, colonization and the slave trade. The impulse toward racial categorization was shaped by wider trends in scientific thought, notably early biologists’ efforts to catalogue and classify the natural world. Hence, racial theories were not born of a premodern, atavistic urge but emerged at precisely the time when the scientific foundations of modern societies were being built.

Nor was this association of race and science a passing fad: The same unholy alliance returned in the late nineteenth century in the form of Social Darwinism and the eugenics movement (see below). One controversy surrounding the early attempts to classify distinct races was that they appeared to conflict with the Biblical creation story. Supporters of monogenesis argued that all humans shared a common ancestor, a position consistent with descent from Adam, while advocates of polygenesis argued that the different human races had separate origins and were in fact distinct species.

In addition to this intellectual context, racial thought was also shaped by the political and economic interests of European powers. As these countries colonized Africa, Asia, and the Americas, ideas about racial difference and superiority furnished a language to explain and legitimize European dominion. These discourses took many forms—an important distinction was between those that depicted non-Europeans as irredeemable “savages” and those that characterized them as “backward races” who could, with the correct tutelage, progress toward a civilized state. Both served to justify exploitative and demeaning practices. Nowhere were these more obvious than in the transatlantic slave trade, which flourished during the eighteenth century.

However, as the links to scientific debates indicate, racial theorizing was not developed for purely instrumental reasons, nor was it restricted to dedicated race theorists, slave traders, or colonial administrators. On the contrary, assumptions about racial categories were deep-seated and widespread, and debates about race captured the imagination of many writers and leading philosophers, including Voltaire, David Hume, and Immanuel Kant. If these and other writers came to very different conclusions about the origins and significance of racial categories, what was widely shared was the view that such categories were a natural, even self-evident, phenomenon. During the nineteenth century, racial ideas played an important role in philosophies of history developed by first-rate thinkers such as Georg Wilhelm Friedrich Hegel and lesser minds such as Joseph Arthur Comte de Gobineau. Again, there were substantial variations, but a common thread was to attribute an important role to race in explaining the rise and fall of nations and civilizations.

Race Ascendant

In his 1903 book, *The Souls of Black Folk*, the influential African American intellectual W. E. B. Du Bois famously claimed that the problem of the twentieth century was the problem of the color line. Subsequent events would bear out his contention. In the United States, although slavery had been abolished after the Civil War, racial segregation persisted in the form of Jim Crow laws, and in 1896, the U.S. Supreme Court upheld the constitutionality of racial segregation with the notorious doctrine of “separate but equal.” The early twentieth century was also the peak of European empires and therefore of the rule of white Europeans over African and Asian peoples.

During this time, a new form of scientific racism, with concrete policy implications, was gaining ground. It began with the fusing of a novel scientific approach, Darwinism, with racial theory. In the late nineteenth century, Darwin’s theories of natural selection had been taken up by a number of his followers, who argued that human beings could create an evolutionary improvement in the species by actively intervening in sexual reproduction. In 1883, Darwin’s half-cousin Francis Galton coined the term “eugenics” to describe this approach. Galton, and eugenicists after him, advocated selective breeding to improve the “fitness” of the human species: “Positive eugenics” would require that the “fittest” be encouraged or forced to reproduce, while “negative eugenics” would discourage or force the “unfit” not to reproduce, by sterilization if necessary. Eugenics received support from prominent intellectuals and politicians across the political spectrum. In the United States, eugenic arguments played an important role in the construction of the “national origins” quota system that shaped immigration flows until the 1960s, and compulsory sterilization of “imbeciles or the feeble-minded” was implemented in a number of states. In 1927, the Supreme Court upheld the constitutionality of sterilization by a majority of eight to one in the infamous *Buck v. Bell* case. Sterilization policies were implemented in several other countries, including Japan and Sweden.

It was in Germany that the most virulent, and racialized, form of eugenics developed. Influenced by the ideas of the Anglo-German writer Houston

Stewart Chamberlain, who argued for the supremacy of an “Aryan race,” the Nazis developed eugenics policies with the aim of maintaining a “pure” German race. This approach began with sterilization of those who were deemed physically and mentally unfit and proceeded to the murder of thousands of disabled people in compulsory “euthanasia” programs during the 1930s. At the same time, Jews were being persecuted and stigmatized as enemies of the Third Reich. The Nuremberg Laws of 1935 defined Germans and Jews based on their descent or “blood,” stripped the latter of their citizenship, and outlawed marriage or intercourse between “Jews” and “Germans.” These laws were justified with reference to racial theories about Aryan supremacy. Anti-Semitism and persecution grew during the later 1930s; from 1940, Jews were forced into ghettos; and from 1942, they were deported to extermination camps. Some six million Jews, as well as hundreds of thousands of Romani, were murdered. Many of the killing techniques used in the camps had been developed in the earlier eugenic programs.

Race in Retreat

World War II was a watershed in the history of racial thought. The defeat of Nazism and revelations about the extermination camps catalyzed a shift in global opinion. Writers such as Franz Boas and Ashley Montagu began to challenge the biological bases of racial categorization and found a receptive audience. In 1949, the recently established United Nations (UN) gathered eminent academics in Paris to discuss the concept of race. The following year, the UN Statement of Race asserted that there was just one human species, *Homo sapiens*, and that race had been falsely used to describe a range of national, cultural, and religious groups. It further recommended that the term be dropped and replaced with “ethnic groups.” The statement was not uncontroversial, but it represented a major epistemic shift: In a remarkably short period of time, the naturalistic understanding of race was replaced by a new consensus that racial categories were social constructs, not biological essences.

At the same time as race was losing its scientific credibility, racially structured forms of rule were coming under increased strain. The struggle for independence in colonized countries picked up momentum, and it

became increasingly difficult for the Allied powers, which had fought a war for self-determination against a racist state, to deny the claims of self-government by nonwhite peoples. By the 1970s, the major European empires had been largely dismantled.

Decolonization and the discrediting of racial theories did not mean that political racism had disappeared. On the contrary, the second half of the twentieth century witnessed two iconic struggles for racial equality: the U.S. Civil Rights Movement and the campaign against apartheid in South Africa. The U.S. Civil Rights Movement developed to challenge racial injustice, including segregation, disenfranchisement, and violence, in the Southern states. Segregation persisted despite the overturning of the “separate but equal” doctrine in the 1954 Supreme Court case *Brown v. Board of Education*. A grassroots movement led by prominent African Americans, including Martin Luther King Jr., staged sit-ins, bus boycotts, and other forms of nonviolent protest in a campaign of civil disobedience that eventually bore fruit with the 1964 Civil Rights Act and the 1965 Voting Rights Act. Racial injustice was not eradicated by the Civil Rights Movement, but some of the most glaring wrongs were, finally, addressed.

South Africa swam very much against the tide during the postwar period. The apartheid regime of racial segregation was officially created by the white National Party government in 1948 and actually intensified over the following decades. In the face of internal resistance led by the African National Congress and growing international condemnation, the South African government attempted to reform apartheid during the 1980s, but it was only in the 1990s that this most egregious form of racial rule was overturned and multiracial democratic elections were held for the first time, in 1994.

Explaining Racial Categorization and Racism

If biological explanations of race have been discredited, how should the existence of racial categorizations and racism be explained? Contemporary theories of race and racism are, unsurprisingly, informed by wider understandings of society. Within social science, theories based on Marxist, Weberian, rational-choice, poststructuralist, psychoanalytical, and neo-

Gramscian frameworks have been developed. It is beyond the scope of this article to discuss all of these in depth, but a brief summary of some especially influential theories follows.

A large amount of the debate on race has occurred among Marxist or neo-Marxist writers. Marxist explanations range from economically reductionist and deterministic accounts of the relationship between race and class to more sophisticated approaches that shade into the other traditions discussed below. At one end of the spectrum race is viewed as an ideological construct that obscures class relations and prevents the formation of class consciousness. Intraclass divisions based on racial identities prevent the identification of common interests between, for example, black and white workers, and the promotion of racial categories therefore serves the interests of ruling classes by dividing workers into racialized groups. Less instrumental Marxist accounts have also emphasized the role of race in the reproduction of capitalism but have not assumed a simple determination of race in terms of class relations. Sociologists such as Paul Gilroy and Stuart Hall analyzed the processes by which race was constructed as a social and political category. For these writers, racially structured social formations were not simply determined by class. What all Marxist approaches share, however, is an analysis of the relationships between racism and the capitalist mode of production, whether in the context of plantation slavery, colonialism, or more recently, migration and multicultural societies.

One of the most influential recent analyses of racial categorization and racism is the “racial formation” approach developed by Michael Omi and Howard Winant (1994). Their theory aims to steer between the discredited view of race as “essence,” as something natural or fixed, and the equally problematic idea of race as “mere illusion,” as found in some cruder Marxist accounts. Omi and Winant argue that race cannot be subsumed under some other social category (such as class) but must be analyzed as the outcome of political contestation over racial meanings, which occurs at the levels of both collective political action and personal practice. Racial formation is “the process by which social, economic and political forces determine the content and importance of racial categories, and by which they are in turn shaped by racial meanings” (p. 61). Race is thus theorized

as a complex of social meanings that is undergoing constant transformation through political struggle.

A second set of theories about race and racism can be found in the psychological literature. These theories differ from the social-science approaches outlined above in that they generally locate the impulse toward racial categorization and even racism within human cognitive processes. Psychological approaches can be subdivided into four groups: socialization, perceptual saliency, group prejudice, and evolutionary theories. Socialization theories argue that children either are explicitly taught to make racial distinctions—by parents, teachers, and peers—or pick them up from the social environment without anyone explicitly teaching them. Theories based on perceptual saliency view racial thinking as a special case of a more general tendency of human beings to classify objects into groups according to their perceptually salient features. Color, it is argued, is a salient visual property, and thus, skin color triggers a general categorizing impulse that is central to our cognitive systems. Group-prejudice theories also see racial categorization as a special case of a general tendency, but this time that tendency is toward the formation of group prejudices, whether those groups are based on sex, class, or national identity. According to these approaches, human beings' cognitive systems are predisposed to form stereotypes about social groups, and the impulse to racial thinking is just one example of this phenomenon. Lastly, evolutionary psychologists argue that the tendency to classify people racially results from a species-wide cognitive system that evolved early in human history. They hypothesize that a module of our cognitive systems that allows us to navigate the social world, and which probably evolved for purposes quite unrelated to racial categorization, predisposes us to make racial distinctions.

Beyond Race?

The question of how to explain racial thinking underlies an important contemporary debate about the use of racial categorizations. We have seen that the biological basis of race has been widely rejected and that a consensus exists about its socially constructed nature, even though there is disagreement about how and why it is constructed. This consensus has given rise to disagreement about whether racial categorizations should be

used at all, especially by social and political theorists. If racial categories are social constructions, with close ties to oppression and subjugation, should theorists persist in using them or seek to purge social and political discourse of any reference to race? Ron Mallon (2006) has neatly characterized this dispute as a debate between “eliminativists” and “conservationists.” Eliminativists such as Kwame Anthony Appiah and Amy Gutmann (1996) or Naomi Zack (2002) argue that since races do not exist, we should desist from “race talk”—making racial distinctions, using racialized terms, and so on. They aim for a world without race. Conservationists such as Lucius Outlaw, on the other hand, argue that even though racial categories are socially constructed, they do and should form the basis of social identities, and therefore, race talk must persist. Rather than a world without race, they aim for a world without racism.

It is worth pointing out that any resolution of this debate turns not only on ethics but also on the facts of the matter. Although this issue is typically discussed as a normative question (*should* we overcome racial categorizations?), a prior feasibility question (can we overcome racial categorizations?) is fundamental. There is no point in wishing for an end to racial categorization if it is hardwired into us. Hence, the explanatory theories outlined above acquire normative significance: Those who explain race as an illusion functionally related to oppression will likely view race as something that not only can but also should be overcome; those who see racial categorizations as an unavoidable part of our social world, or moreover think that they are grounded in human psychology, may well want to eliminate racism but will likely be skeptical about the possibility of overcoming racial categorization.

Race-Making and the Politics of Antiracism

The preceding debate, conducted mostly by race theorists, has a practical corollary in the politics of antiracism. This can be understood as a dilemma between nonracialism and race consciousness. States that espouse a normative commitment to antiracism yet continue to be characterized by racially structured sociopolitical orders—including most democratic societies—must steer a course between the denial and the reproduction of race. The very policies and institutions designed to tackle racism have a

tendency to reproduce existing, and even produce new, racial categories. Census questions, antidiscrimination legislation, racial monitoring, and affirmative-action programs all rest on racial classifications. Thus, the antiracist dilemma, a refusal to recognize race, may help delegitimize it as a social category but at the cost of denying the reality of race-based disadvantage, whereas race-based legislation intended to address racial disadvantage risks reproducing the very categories that it seeks to overcome. Put bluntly, does antiracism require the recognition and institutionalization of racial categories, or does this approach merely reproduce the very distinctions that antiracism seeks to overcome?

The policy implications can be clearly seen by a brief comparison of three democratic countries with very different approaches to antiracism: France, the United Kingdom, and the United States. In France, race is not viewed as a valid category for public discourse, nor is it embedded in state institutions or legislation. Recently, a heated debate has taken place about whether racial or ethnic statistics should be collected, a policy that would require the introduction of racial categories into public-policy discourse. In the United Kingdom, by contrast, race has long been a common term in public-policy debates. Starting in the 1960s, U.K. governments passed “race relations” legislation, and since 2000, public authorities have had a statutory duty to promote “race equality,” a phrase that is anathema to the French approach. Since the 1960s, the United States has been even more race conscious in its approach to racial inequalities. For example, affirmative-action policies have been upheld by the Supreme Court so long as they are “narrowly tailored.” The important 2003 *Grutter v. Bollinger* decision, which ruled on the University of Michigan Law School’s affirmative-action admissions policy, argued that “diversity is a compelling state interest that can justify the use of race in university admissions”—but only as one of many factors (the university’s quantitatively preferential undergraduate admissions program was ruled unconstitutional). In sum, these three countries’ approach to antiracism policies could be arrayed along a spectrum with the French nonracist approach at one end, the U.S. race-conscious approach at the other, and the United Kingdom in between, but closer to the latter. The controversies surrounding the normative justification and practical impact of these three divergent approaches illustrate the contested ground of contemporary racial politics and thought.

Radicalism

Radicalism

671

672

Radicalism

“Radicalism” has not been consistently applied to any specific political program. Instead, it has largely served as a loose descriptor for a range of ideas, factions, personalities, and parties.

The term *radical* was employed in political discourse in Britain before 1750. However, usage in this earlier period tended to reflect its Latin origins: *radix* = root, reflecting a fundamental or inherent quality. So to suggest, as did the politician and writer Nathaniel Bacon in a work published in 1647, that the English constitution was “radical” was to contend that English liberties were based on an original ancient constitution unaltered by foreign invasion or outside influence.

This approach is quite different from the political usage of “radical” as defined by the *Oxford English Dictionary*: “advocating thorough or far-reaching political or social reform.” For that reason, some historians are reticent about applying the terms radical or radicalism to premodern politics. The argument is that there is a danger of presenting individuals and groups as advocating changing the political or social *status quo* when, in fact, many justified their arguments on the basis that they were upholding legal and historical traditions or social norms. Of course, as noted by the historian Robert Zaller, simply because arguments were legitimated by references to the traditional does not mean that the content or consequences of these arguments were not radical in the modern understanding of the term.

A further area of difficulty with this term relates to the notion of a “radical tradition”—that is, a lineage of radical thought that can be traced across historical time periods. This idea has received scholarly articulation in the works of British Marxist historians such as Christopher Hill and E. P. Thompson. However, the most powerful presentations of this idea have come from British left-wing politicians, notably, Tony Benn and the late Fenner Brockway. In these depictions of the radical tradition, seventeenth-century groups such as the English Levellers or Diggers are seen as prototypes of twentieth-century “radicals”—socialists, communists, and so on. The element of anachronism in these portraits is obvious, but many premodern historians remain attached to radical and radicalism as useful labels. Scholars including Glenn Burgess and J. C. Davis have argued that a “functionalist” approach to the term—viewing groups or individuals as radical depending on their place in the spectrum of contemporary political or social thought—allows historians to use the term as a valuable descriptor without investing either in grand narratives of radicalism or in distorting the aims and aspirations of premodern radicals. For historians of the nineteenth century, the term is less problematic given that radical and radicalism had become common political terms. The phrase “radical reformer” was invoked in Britain, both negatively (to denote extremism) and positively (to indicate a staunch supporter of necessary political reform) with increasing frequency in the decades after the Peterloo Massacre of 1819. In the first half of the nineteenth century, radicalism came to be closely associated with popular reform movements, particularly the Chartists, who advocated adult male suffrage, the secret ballot, and annual parliaments.

By the second half of the nineteenth century, however, the meaning of radicalism had shifted in response to changes in both popular and parliamentary politics. As noted by Raymond Williams, “radicalism” became distinctly less “radical” in the present-day understanding of the term. It became attached instead to the reforming wing of the British Liberal party and was often used to differentiate reformers operating within the British liberal/constitutional tradition from those groups, including remnants of the Chartists, who had adopted socialist and/or revolutionary ideas. In a North American context, “radical” also came to be associated with a wing of a mainstream political party. “Radical Republicans” argued for a post–Civil War settlement that gave greater rights to former slaves

while exacting greater retribution against the former Confederacy (including disenfranchising its supporters). Within Congress, the Radical Republicans were also instrumental in pressing for the impeachment of President Andrew Johnson.

By the twentieth century, understandings of “radical” and “radicalism” in both the United Kingdom and the United States had shifted once more to incorporate groups—socialist/communist/revolutionary—that radicalism had once been differentiated from.

In pejorative use, the term came to be applied in a similar fashion to that applied in the 1820s and 1830s as a synonym for extremism or fanaticism. This understanding of the term has considerable currency in twenty-first-century British and American politics, in which “radicals,” “radicalism,” and “radicalization” are frequently connected with Islamic terrorist groups or state socialism. The terminology remains unstable, however, given the coterminous revival, particularly evident in the speeches of former British Prime Minister Tony Blair, of “radical” and “radical reform” as signifying far-reaching structural change, especially to the welfare state.

Ramadan, Tariq

Ramadan, Tariq

672

673

Ramadan, Tariq

Tariq Ramadan is a Swiss-born academic and contemporary European Muslim intellectual who is an advocate of Muslim reform and renewal. In his writings and public presentations, he emphasizes the importance of religion as a force countering the negative aspects of modern secularist ideologies. His broad goal is to provide an articulation of the Islamic message that shows the relevance and importance of Islam in the contemporary modern age. Since this effort involves strong critiques both of many current social and political policies in the West and of old-style and long established Muslim positions and practices, his views are sometimes controversial but influential. He was on the 2004 *Time* list of the most influential people in the world and the *Foreign Policy* lists of the “Top 100 Global Thinkers” in 2009 and 2010.

Ramadan was born in Geneva in 1962. His maternal grandfather was Hasan al-Banna, the founder of the Muslim Brotherhood in Egypt, and his father was Said Ramadan, a Brotherhood leader who was forced into exile because of the suppression of the organization in Egypt beginning in the 1950s. His father was active in global Muslim affairs and established the Islamic Center of Geneva, which became an important research and educational institution. Tariq Ramadan completed graduate studies in literature and philosophy and received a doctorate in Islamic Studies from the University of Geneva in 1996. He taught at a number of institutions, including the University of Fribourg and the Collège de Saussure. In 2004, he was invited to become the Luce Professor of Religion at the University

of Notre Dame in the United States. He was unable to assume that professorship because the U.S. Department of State denied him the necessary visa on security grounds. Instead, he accepted a position in St. Antony's College, part of the University of Oxford in the United Kingdom, in 2005.

As a prominent intellectual among the Muslims who are now second- and third-generation Europeans rather than recent immigrants, Ramadan defines the distinctive dimensions of European Muslim life. He argues that a Muslim personality is emerging that is faithful to the timeless principles of Islam but is expressed within the frameworks of European and American cultures. The distinction between particular culture and universal religion is important within Ramadan's broader concept of renewal. In his view, Islam as a universal religion must be relevant in the broad diversity of world cultures and is not tied to one particular culture's mode of manifesting the Islamic faith. He argues that Islam is a religion, not a culture. In this way, it becomes possible to speak of "European Islam" or "American Islam."

A major challenge in developing this vision for Muslims in the West is to develop an understanding of how Islamic legal traditions and jurisprudence can be relevant for Muslims living in societies where the majority of the population is non-Muslim. Ramadan urges Muslims to go beyond minority thinking, moving from concepts of adaptation and assimilation to seeing themselves as part of a pluralist society. An important part of this reconceptualization is a move away from the older Muslim view of the world being divided into *dar al-Islam* (the realm of Islam) and *dar al-harb* (the realm of war where law and the state are non-Islamic). Instead, in the context of globalization, Ramadan proposes that Muslims now live in a "realm of testimony" (*dar al-shahadah*) in which all people bear witness to the principles of their faiths.

Although many people view Ramadan as an important positive voice in the Muslim world, others are strongly critical of his positions. More traditionalist and conservative Muslims object to his reconceptualizations of Islam as being unacceptable innovations. However, the strongest objections have come from more secularist Western intellectuals, such as Paul Berman. They do not disagree so much with his proposed religious reforms, as they

argue that, despite the moderation of his positions when he is addressing Western audiences, he is somehow a supporter of Islamic radicalism and terrorist groups, although he has publicly denounced terrorism on many occasions. They also interpret many of his policy statements to be anti-Semitic and anti-Western in substance.

Both critics and supporters agree that Ramadan is an important voice in the increasingly global networks of action and communication involved in interreligious and intercultural relations in the twenty-first century. In his work, Ramadan tries to present what he calls a “new geography” for comprehensive reinterpretation of Islam for the new local and global contexts in which Muslims live.

Rand, Ayn

Rand, Ayn

673

674

Rand, Ayn

Ayn Rand's (1905–82) philosophy of rational selfishness, limited government, individualism, and moral capitalism, expressed in her bestselling novels *The Fountainhead* (1943) and *Atlas Shrugged* (1957), has been deeply influential on libertarian and conservative thought. Rand's atheism made her a controversial figure among religious conservatives, but many shared her free market views and came to accept her argument that capitalism was a moral system. Although she denounced libertarians for their lack of principles, Rand was a primary inspiration for the 1970s libertarian movement. Her longevity as a popular political philosopher has been remarkable. In 2009, nearly 30 years after her death, *Atlas Shrugged* sold a record-breaking 500,000 copies and she was embraced by the right-leaning Tea Party movement.

Ayn Rand was born in 1905 as Alissa Rosenbaum, the eldest daughter of a prosperous Jewish family in St. Petersburg, Russia. She developed a lifelong hatred of communism when her father's chemistry shop was nationalized during the Bolshevik revolution. In 1926, Rosenbaum immigrated to the United States with the help of relatives, changing her name to Ayn Rand. She sought her fortune first in Hollywood, working briefly as a screenwriter. The influence of Hollywood can be seen in the cinematic quality of her fiction, which is epic in scope and marked by glamorous, stylized heroes and villains.

In 1940, Rand volunteered for Wendell Willkie, the Republican candidate for U.S. president. Always anti-Communist, Rand now began to worry about “collectivism,” a more general term for ideas and policies she thought threatened individual freedom. She threaded these ideas into her bestselling 1943 novel, *The Fountainhead*, the story of an independent architect who refuses to compromise. A coded political parable that attacked the collectivism of the New Deal, *The Fountainhead* earned Rand an important place in the growing conservative movement.

In the following years, Rand worked to formalize her ideas into a system she called objectivism, turning from a former interest in Friedrich Nietzsche to Aristotle. Focusing now on rationality, Rand strove to create a new secular philosophical system that would justify capitalism by promoting the virtue of rational selfishness. Rand argued that unregulated, laissez-faire capitalism is a moral system because it enables the rational individual to reap the full benefits of his or her labor. By contrast, redistribution of wealth through taxes or welfare programs is immoral because it penalizes the productive and rewards the unproductive. Rand argued that a morality of altruism underlay modern society and caused most of the world’s problems.

She expressed these ideas in another bestselling novel, *Atlas Shrugged* (1957), a dystopian narrative of America brought to the brink of ruin by socialist policies. *Atlas Shrugged* emphasized the contribution of uniquely gifted individuals. Rand’s hero, John Galt, convinces business leaders and artists to go “on strike” until their talents are adequately rewarded. In a society ruled by altruism, Rand suggests, there will be no producers left.

Panned by critics, *Atlas Shrugged* was feverishly embraced by a rising generation of conservatives and libertarians. Among her most devoted fans was Alan Greenspan, the future head of the Federal Reserve Board, who was attracted to her free market politics and her clear-cut ideology. Through the New York–based Nathaniel Branden Institute (NBI), Rand and others offered courses in her philosophy. She promoted her political views through a newsletter, several bestselling nonfiction books, and frequent appearances in the media. In 1968, Rand folded NBI and broke with her closest collaborators. Despite Rand’s sudden exit from public life, her ideas

continued to circulate widely among libertarians. A number of her students and admirers went on to careers in politics and political activism, continuing her influence in conservative and libertarian circles.

Rand has been harshly criticized for both her ideas and her actions. After Rand's death, Barbara Branden revealed Rand's liaison with her husband Nathaniel Branden and her use of amphetamines. She and others described a toxic atmosphere of cultlike conformity surrounding the novelist and argued that Rand's personal failings were symptomatic of flaws in objectivist philosophy that led to dogmatism, rigidity, and an overemphasis on rationality at the expense of emotion.

From afar, critics have attacked Rand for lacking kindness or empathy and for promoting the strong over the weak. Even some who agree with her platform of unregulated capitalism and limited government deplore the harshness of her fiction and her rejection of religious values. Philosophers have scorned Rand's objectivism, and literary critics scoff at her novels for their cardboard characters and black-and-white worldview. Yet Rand's celebration of the individual and her critique of government continue to resonate with an ever growing readership.

Rawls, John

Rawls, John

674

679

Rawls, John

John Rawls (1921–2002) is credited with having revived substantive English-language political philosophy, after its near death at the hands of logical positivism, and with advancing a compelling alternative to utilitarianism: the theory of justice as fairness. He has been called the greatest philosopher of liberalism since John Stuart Mill, although his later work revealed a vision of “political liberalism” that was in many ways set against the “comprehensive” defenses of liberalism of such figures as Mill, Immanuel Kant, John Dewey, and Jürgen Habermas.

Rawls attended Princeton University, graduating summa cum laude in 1943, and then joined the U.S. Army. His traumatic experiences during World War II led him to abandon his interest in the Episcopalian priesthood and opt instead for graduate school in philosophy at Princeton. He completed his thesis (“A Study on the Grounds of Ethical Knowledge”) under W. T. Stace in 1948 and in 1952 won a Fulbright fellowship to study at Oxford, which brought him into contact with Isaiah Berlin, Stuart Hampshire, and H. L. A. Hart. After Oxford, Rawls taught briefly at Cornell University, Harvard University, and the Massachusetts Institute of Technology, before returning to Harvard in 1962. He remained at Harvard, where he achieved the rank of university professor, even beyond his official retirement in 1991, and continued to teach until 1995, when his health began to deteriorate.

Rawls’s earliest professional publications—notably “Outline of a Decision Procedure for Ethics” (1951) and “Two Concepts of Rules” (1955)—were

important in their own right, but they scarcely suggested the scope of his later success. It was only with the appearance of “Justice as Fairness,” in 1957–58, that the direction of his political philosophical project was truly set. “Justice as Fairness,” a short version of which appeared in *The Journal of Philosophy* in 1957, with a longer, canonical version appearing in the *Philosophical Review* the following year, introduced the basic Rawlsian claim that “the fundamental idea in the concept of justice is fairness” and “it is this aspect of justice for which utilitarianism, in its classical form, is unable to account, but which is expressed, even if misleadingly, by the idea of the social contract” (Rawls 1999a, 47). Although some of the special terminology was missing, the core idea and the distinctive principles of justice were not:

The principles of justice may be thought of as arising once the constraints of having a morality are imposed upon rational and mutually self-interested parties who are related and situated in a special way. A practice is just if it is in accordance with the principles which all who participate in it might reasonably be expected to propose or acknowledge before one another when they are similarly circumstanced and required to make a firm commitment in advance without knowledge of what will be their peculiar condition, and thus when it meets standards which the parties could accept as fair should occasion arise for them to debate its merits. Regarding the participants themselves, once persons knowingly engage in a practice which they acknowledge to be fair and accept the benefits of doing so, they are bound by the duty of fair play to follow the rules when it comes their turn to do so, and this implies a limitation on their pursuit of self-interest in particular cases. (Rawls 1999a, 63)

In due course, this would become the claim that the principles of justice for the basic institutional structure of a society should be the two principles that would be chosen in an “Original Position” ensuring fairness. Pursuing that thought would be the work of a lifetime.

Over the course of the turbulent 1960s, Rawls assembled, essay by essay, the component parts of the grand presentation of his theory of justice in his

classic work, *A Theory of Justice* (1971). Although Rawls had been a critic of the U.S. war in Vietnam, his first major book was at some remove from the political and historical particulars of its time and place, making for much controversy over just how radical Rawls really was, and how and where his theory could be applied. Condemned both as hopelessly utopian and as a mouthpiece for “end of ideology” liberal gradualism, Rawls quickly found his views being assailed from all sides (Daniels [1975] 1989).

The bottom line of Rawls’s theory of justice as fairness as presented in *Theory* can seem straightforward: A just liberal society will have its basic legal, economic, and social institutions—the “basic structure of society”—arranged to accord with the following two principles of justice: First, “[e]ach person is to have an equal right to the most extensive total system of equal basic liberties compatible with a similar system of liberty for all”; second, “[s]ocial and economic inequalities are to be arranged so that they are both: (a) To the greatest benefit of the least advantaged, consistent with the just savings principle, and (b) Attached to offices and positions open to all under conditions of fair equality of opportunity” (Rawls [1971] 1999, 302).

These principles are lexically ordered, in that the first principle, of liberty, takes priority over the second; liberty “can be restricted only for the sake of liberty.” Moreover, the “second principle of justice is lexically prior to the principle of efficiency and to that of maximizing the sum of advantages; and fair opportunity is prior to the difference principle”—that is, (b) takes priority over (a) in the second principle (Rawls [1971] 1999, 302–03). (a) came to be called the “difference principle” and in later formulations (Rawls 2001) was placed after (b), or fair equality of opportunity, on Rawls’s account a robust conception, not only of nondiscrimination on the basis of race, religion, etc., but also of equal educational opportunity, basic health care, and limitations on the concentration of wealth.

Rawls also sketches a more general conception, perhaps appropriate to more primitive circumstances, on which all social values “are to be distributed equally unless an unequal distribution of any, or all, of these values is to everyone’s advantage.” But he allows that, given the

circumstances of justice as he understands them, it is appropriate to “attend throughout to the conditions under which the absolute weight of liberty with respect to social and economic advantages . . . would be reasonable” (Rawls [1971] 1999, 54–55).

Why these two principles? Because, again, these are the principles that would be chosen by the parties in an Original Position (OP)—vaguely analogous to a hypothetical state of nature—capturing conditions of fairness. “They are the principles that free and rational persons concerned to further their own interests would accept in an initial position of equality as defining the fundamental terms of their association” (Rawls [1971] 1999, 11). But now the parties in the OP are conceived of as being behind a “veil of ignorance,” such that they do not know their specific identities, characteristics, and distinctive individual interests, social positions, etc. They are in essence choosing institutional principles to structure the range of life prospects in the society into which they or their children could be born and live their lives, not knowing what special (but morally arbitrary) bargaining advantages they might have. The fairness of the conditions is meant to transfer to the principles themselves. Just as it is fair to decide the rules of a game in advance, people are to imagine that they need “to decide in advance how they are to regulate their claims against one another, and what is to be the foundation charter of their society” (Rawls [1971] 1999, 11), and this without the information that might prejudice them.

In trying to “present a conception of justice which generalizes and carries to a higher level of abstraction the familiar theory of the social contract” (Rawls [1971] 1999, 11) and arguing against utilitarianism, perfectionism, and other historical alternatives, Rawls argues both for the entire framework (later called Kantian Constructivism) of the principles of justice being the result of choice in a constructed fair initial situation, and, more specifically, for the choice of the two principles rather than for utilitarian principles by the parties in the OP, accepting the need for such a hypothetical device of representation. Throughout, his primary concern is with “ideal theory,” determining principles of justice for a well-ordered society in which all would accept and comply with them, thus, yielding an ideal for guiding the actual world in the direction of justice.

Much criticism of Rawls's views has been compromised by a failure to distinguish the three perspectives or points of view at work in his approach:

1. That of the parties in the OP, all of whom are identically situated
2. That of the citizens of a well-ordered society with a public conception of justice
3. That of the ordinary people living in the world as it is, who are being invited to accept the two principles and their justification.

The parties in the thought experiment that is the OP are very abstractly, hypothetically defined, and symmetrically situated, being behind the veil of ignorance and choosing on the basis of an index of primary goods, or such all-purpose resources as rights and liberties, powers and opportunities, income and wealth, and the social bases of self-respect, which are useful whatever a person's particular rational life plan. The citizens of a future well-ordered Rawlsian society are envisioned as real people who will have developed a full sense of justice thanks to living their lives out in a stable and just society, a fair system of cooperation from one generation to the next. They will be fully capable of the kind of fair play and reciprocity that justice as fairness demands, in full compliance with the demands of justice. The narrow "rationality" of the parties in the OP should not be confused or conflated with the reasonableness of real people in the other two perspectives. Rawlsian justice is no egoistic, Hobbesian bargaining game but appeals rather to a sense of justice endorsing social cooperation on genuinely fair terms, by citizens whose "interests" reflect various conceptions of the good that might include any number of religious, moral, and/or philosophical commitments. Ordinary, actually living people may or may not be so fair-minded initially but are invited to accept these ideal conceptions because they better reflect and bring order to their deepest considered convictions, especially as members of liberal democratic cultural traditions. For Rawls, from "the standpoint of moral philosophy, the best account of a person's sense of justice is not the one which fits his judgments prior to his examining any conception of justice, but rather the one which matches his judgments in reflective equilibrium . . . this state is one reached after a person has weighed various proposed conceptions and he has either revised his judgments to accord with one of them or held fast

to his initial convictions (and the corresponding conception)” (Rawls [1971] 1999, 48).

Thus, utilitarianism, which ignores the differences between persons in its aggregative maximizing of happiness, cannot do justice to our deep convictions concerning, say, the injustice of slavery, since this is no mere matter of slavery simply being less than conducive to the greatest happiness. No amount of, say, wealth and income maximization can compensate for the loss of liberty and fair equality of opportunity that characterizes slavery.

Justice as fairness mobilizes such considered convictions, at all levels of generality, using them to frame basic ideals of free and equal moral persons in a well-ordered society with a public conception of justice and, thus, affording a better “wide and deep reflective equilibrium” than utilitarianism and other alternatives. The core rights and liberties of citizens, defined especially by the first principle, are inviolable. The parties in the OP would not gamble with such fundamental matters—hence, their choice of the two lexically ordered principles.

In many respects, Rawls was his own harshest critic in the decades following the publication of *Theory*. He allowed that he had often put his points badly and in misleading terms. Thus, he came to more fully specify the *moral* ideal of the citizen reflected in the description of the parties in the OP, such that they were described as having a higher order interest in their own freedom that made it that much clearer why they would not choose principles that might allow their rights and liberties to be sacrificed. Primary goods were thus redefined as allpurpose goods for citizens so conceived, rather than as all-purpose goods period. And Rawls became, especially in the 1980s, profoundly concerned to stress that justice as fairness should be regarded as one member of a family of conceptions that are simply *political* conceptions of justice, rather than extensions or pieces of some particular comprehensive ethical and/or religious worldview, whether that be utilitarian, Kantian, Thomist, or whatever. His second major book, *Political Liberalism* (1993), in effect showed how, in a deeply but reasonably pluralistic society, it was as unreasonable to expect everyone to convert to Kantian liberalism as it was to expect everyone to convert to

Lutheranism. The aim, rather, was to find an “overlapping consensus” allowing for such profound differences. Justice as fairness was to be “political, not metaphysical,” affording a public philosophy for reasonably just constitutional regimes marked by the fact of reasonable pluralism, and public reason precluding undue appeal to reasons that cannot be shared. Rawls thus admitted “that as used in *Theory*, the idea of a well-ordered society of justice as fairness is unrealistic” (Rawls 1993, xix).

In the final version of the two principles set out in Rawls’s *Justice as Fairness: A Restatement* (2001), there are some important differences, especially to the first principle, which now reads as “[e]ach person has the same inalienable claim to a fully adequate scheme of equal basic liberties, which scheme is compatible with the same scheme of liberties for all” (Rawls 2001, 42). Rawls is at pains not to suggest that there is any such thing as “liberty” as such, that could be maximized. Rather, there are particular basic rights and liberties, for example, freedom of conscience, drawn from consideration of “what liberties provide the political and social conditions essential for the adequate development and full exercise of the two moral powers of free and equal persons” (Rawls 2001, 42), these moral powers being “the capacity to understand, to apply, and to act from . . . the principles of political justice that specify the fair terms of social cooperation” and the “capacity to have, to revise, and rationally to pursue a conception of the good” (Rawls 2001, 18–19). Given this ideal of the citizen, which needs to be modeled in the description of the parties in the OP, it is that much clearer why the two principles, lexically ordered, would be the result. Indeed, Rawls explains that we “should like the argument from the original position to be, so far as is possible, a deductive one, even if the reasoning we actually give falls short of this standard. The point in aiming for this is that we do not want the parties’ accepting the two principles to depend on psychological hypotheses or social conditions not already included in the description of the original position” (Rawls 2001, 82). Moreover, the ideal in question is more clearly an ideal of the *citizen*, of how people want themselves to be regarded specifically in their capacity as citizens, rather than an account of personal or social identity in general.

What would a just well-ordered Rawlsian society involve? As Rawls made clear in his later work, the main options that might meet the demands of

justice were either liberal socialism or a property-owning democracy. He somewhat preferred the latter, which he described as fundamentally different from welfare-state capitalism (much less laissez-faire capitalism): “[T]he background institutions of property-owning democracy work to disperse the ownership of wealth and capital, and thus to prevent a small part of society from controlling the economy, and indirectly, political life as well. By contrast, welfare-state capitalism permits a small class to have a near monopoly of the means of production.” The intent is “to put all citizens in a position to manage their own affairs on a footing of a suitable degree of social and economic equality” (Rawls 2001, 139).

But Rawls’s radicalism at home was not matched by an analogous radicalism in the sphere of global justice, although his views were progressive to a degree and at odds with “realist” schools of international relations. In *The Law of Peoples* (Rawls 1999b), Rawls set out a second use of the Original Position:

At the next level, the idea of the original position is used again, but this time to extend a liberal conception to the Law of Peoples. As in the first instance, it is a model of representation, since it models what we would regard—you and I, here and now—as fair conditions under which the parties, this time the rational representatives of liberal peoples, are to specify the Law of Peoples, guided by appropriate reasons. Both the parties as representatives and the peoples they represent are situated symmetrically and therefore fairly. In addition, peoples are modeled as rational, since the parties select from among available principles for the Law of Peoples guided by the fundamental interests of democratic societies, where these interests are expressed by the liberal principles of justice for a democratic society. Finally, the parties are subject to a veil of ignorance properly adjusted for the case at hand: they do not know, for example, the size of the territory, or the population, or the relative strength of the people whose fundamental interests they represent. Though they do know that reasonably favorable conditions obtain that make constitutional democracy possible—since they know they represent liberal societies—they do not know the extent of their natural resources, or the level of their

economic development, or other such information. (Rawls 1999b, 32–33)

The aim is to set out a “realistic utopia,” in the belief that “the nature of the social world allows reasonably just constitutional democratic societies existing as members of the Society of Peoples. In such a world peace and justice would be achieved between liberal and decent peoples both at home and abroad.” The hope is that “the great evils of human history—unjust war and oppression, religious persecution and the denial of liberty of conscience, starvation and poverty, not to mention genocide and mass murder” might be eliminated through the establishment of just or at least decent basic institutions, and that “a world Society of liberal and decent Peoples might be possible” (Rawls 1999b, 6).

“Peoples,” which are not mere nations or states, have shared sympathies, common institutions, and a moral nature and conception of justice, and “decent” peoples are those in nonliberal societies that nonetheless allow citizens “to play a substantial role, say through associations and groups, in making political decisions” and to honor the law for a Society of Peoples (Rawls 1999b, 3, n.2). And out of this second OP would come agreement on various traditional principles to guide the foreign policy of liberal or decent societies, such principles as:

1. Peoples are free and independent, and their freedom and independence are to be respected by other peoples.
 2. Peoples are to observe treaties and Religion and Western undertakings.
 3. Peoples are equal and are parties to the agreements that bind them.
 4. Peoples are to observe a duty of non-intervention.
 5. Peoples have the right of self-defense but no right to instigate war for reasons other than self-defense.
 6. Peoples are to honor human rights.
 7. Peoples are to observe certain specified restrictions in the conduct of war.
 8. Peoples have a duty to assist other peoples living under unfavorable conditions that prevent their having a just or decent political and social regime.
- (Rawls 1999b, 37)

In this case, the “parties are not given a menu of alternative principles and ideals from which to select. . . . Rather, the representative of well-ordered peoples simply reflect on the advantages of these principles of equality among peoples and see no reason to depart from them or to propose alternatives” (Rawls 1999b, 41). This ideal of a Law of Peoples could then provide the needed guidance for dealing with nonideal cases concerning outlaw states and burdened societies, pointing the way to a world “in which all peoples accept and follow the (ideal of the) Law of Peoples.” Rawls concludes that if “a reasonably just Society of Peoples whose members subordinate their power to reasonable aims is not possible, and human beings are largely amoral, if not incurably cynical and self-centered, one might ask, with Kant, whether it is worthwhile for human beings to live on the earth” (Rawls 1999b, 128).

Rawls’s work has proved to be more enduring than that of many of his many critics, who have attacked, often at great length, virtually every aspect of the Rawlsian political philosophy. Yet some criticisms have endured. Many feminists, such as Susan Moller Okin and Martha Nussbaum, have never been persuaded by Rawls’s ideal theoretical treatment of gender issues, and parallel criticisms of the Rawlsian approach to race have been advanced by critical race theorists such as Charles Mills. Moreover, despite Rawls’s sympathy for democratic socialism, many communitarians, socialists, and ecologists have faulted his privileging of two values, liberty and equality, over a wide range of alternatives, such as community, friendship, ecology, wisdom, and self-actualization. Nor can it be said that the political world has moved closer to the Rawlsian ideal or, for that matter, that the Rawlsian prioritizing of domestic justice (which has been powerfully criticized by, among others, Peter Singer, Thomas Pogge, and Martha Nussbaum) really fits the circumstances of justice today, when the most conspicuous injustices of a highly interdependent world concern the global poor.

Religion and Western Political Thought

Religion and western political thought

679

686

Religion and Western Political Thought

In Europe modern political thought was established at the expense of the significance of traditional forms of religion. In the course of modernity, the hierarchy between *auctoritas* (authority) and *potestas* (power) has been reversed. In the Western world, it is common sense that religion has to be subordinated to politics. This great reversal, this historical process, has been called secularization in its broadest sense.

Despite their different agendas and their metaphysical assumptions, religion and politics share a common social interest. Religion as well as politics, is concerned with the behavior of individuals, their participation in and interaction with communities. Therefore, the central question concerning religion and politics is the same: How do we want to live, and how should we live? And, from a religious point of view, we can add a third question: What can we hope for? This is a genuinely religious question since it implies notions of transcendence and teleology, as well as the awareness of contingency. From the perspective of secular politics, the religious dimension is suspended for the benefit of the immanent problem of how shared social concern can be transformed into an effective cooperation. The similarity and overlapping concerns between religion and politics is also the reason for their mutual competition and cause of conflict as well as their mutual cooperation. The instrumentalization of the one by the other has shaped the history of religion and politics and is still a key issue today, despite the prescriptions of the paradigm of secularization.

Milestones in the History of Religion and Politics in the Western Tradition

From the Reformations of the sixteenth century to the Age of Enlightenment and the political systems and ideologies of the nineteenth and twentieth centuries, and finally to the establishment of modern democracies based on constitutional law, traditional religious institutions and religious beliefs have lost their monopoly of interpreting the world and the moral imperative to conduct a good life in this world based on the prospect of the hereafter. In Europe the process of secularization has been understood as a gradual developing subordination of religion under politics, whereas in the United States of America, the relation between religion and politics has taken a different direction. In contrast to Europe's model of domination and subordination, in America, religion and politics are coordinated through a model of implicit cooperation.

Enlightenment in Europe and Its Heritage

Toward the end of the age of the Enlightenment (spanning from the mid-1650s to the start of the French Revolution in 1789), Immanuel Kant famously answered the question: "What is Enlightenment?" in an article of the same title, published in 1784:

Enlightenment is man's emergence from his self-incurred immaturity. Immaturity is the inability to use one's own understanding without guidance from another. This immaturity is self-incurred if its cause is not lack of understanding, but lack of resolution and courage to use it without guidance of another. The motto of enlightenment is therefore: Sapere aude! [Dare to think!] Have courage to use your own understanding! (italics in original)

Despite the many different forms and manifestations of the Enlightenment in France, Germany, England, Scotland, Italy, the Netherlands, or the United States, the main characteristics of the Enlightenment that impacted

on religion and politics are as follows: First, the predominance of individuals' ability to use their own rationality over external guidance; second, the struggle for greater individual and political freedom; and finally, the belief in the progress and development of humanity for the better by purely human efforts.

The emphasis on the individual use of reason and freedom from external obligations challenged religious authorities as well as political obedience. The critique of religion during the period of the Enlightenment led to the elaboration of the concept of a natural religion that is universal to human beings. Following the Scottish thinker of the Enlightenment David Hume, natural religion in contrast to revealed religion rejects any rationally unfounded doctrines, dogmas, and teachings by ecclesial authorities. This natural religion, a twin brother of deism, reduced religious beliefs to its core axioms. These are as follows: first, the human natural ability to discern between good and evil; second, the belief in one benevolent God who does not interfere with the world anymore since its creation; and third, the existence of a rational and meaningful design of the world. Deists have been wrongly accused of atheism by those religions that advocated the supplementation of natural religion by divine revelation. The deist's destruction of theological claims and insistence on religion as a universal anthropological *existential* datum made it possible to argue for an end to denominational disputes and political struggles based on different religious truth claims.

The spirit of Enlightenment augmented the climate for increasing religious tolerance. Enlightened absolutist monarchs like Frederick II of Prussia, Catherine II of Russia, and above all the Austrian Emperor Joseph II (in his patent of tolerance of 1781) promulgated for the first time in modern times edicts of religious tolerance. This new attitude toward a more tolerant treatment of diverse religions and religious dominations differs from earlier political agreements of tolerance in so far as the tolerance of religions was not merely based on economic reasons or for the sake of political stability. Nevertheless, the tolerance of religion was not understood in terms of a constitutionally guaranteed right of freedom of religion until the first amendment to the Constitution of the United States of America in 1789:

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech, or of the press; or the right of the people peaceably to assemble, and to petition the government for a redress of grievances.

In the same year, 1789, the French Revolution overturned the dominance of the Catholic Church in France, and the French Constitution of 1791 declared the freedom of opinion in religious matters as long as they do not disturb public security and tranquility. Also in 1789, the development of religious thought took divergent paths in the United States and in Europe. In the United States, a “civil religion” was developed, whereas Europe entered a period following revolutionary forces. During the years of the Reign of Terror (1792–94), an atheistic pseudo-religion called *Culte de la Raison* followed the proclamation of the first constitution of the French Revolution. Religio-political struggle was centered on the dispute over whether all power comes from God or from the people. This struggle between sovereignty of the people and Divine of Kings is best exemplified by King James I/VI’s speech to the Parliament in 1604.

Civil Religion and Democracy in America

The American constellation of religion and politics differs significantly from the various models of religion and politics on the European continent. The attitude toward religion and politics in America as well as in Europe is anchored in the ideas of the Enlightenment. However, in the light of the history of the settlement of people of different faiths in America, the heritage of the ethos of Enlightenment has been spelled out differently. The United States of America was the first country in the world to guarantee the constitutional right of the free exercise of religion, which brought into existence what Robert Bellah in an essay published in 1967 called civil religion. Although the term *civil religion* goes back as far as Augustine’s discussion of three types of religion distinguished by the Roman polymath Varro, the first modern definition of *civil religion* was given not until Jean-Jacques Rousseau in his famous *Social Contract* (1762):

The dogmas of civil religion ought to be few, simple and exactly worded, without explanation or commentary. The existence of a mighty, intelligent and beneficent divinity, possessed of foresight and providence, the life to come, the happiness of the just, the punishment of the wicked, the sanctity of the social contract and the laws.
(Rousseau 2008, 158–67)

Rousseau's understanding of civil religion proposes a type of religion that operates on a minimal theology and set of doctrines and argues for a unity between politics and religion that is based on the social contract and the laws. These prescriptions of civil religion allow the subordination of theologically inspired conflicts to a common form of religion and the constitution by simultaneously demanding a strict separation of Church and State and a strict separation between religion and politics.

An invaluable early source of the study of religion and politics in the United States is Alexis de Tocqueville's two-volume opus magnum *Democracy in America*, the first volume published in 1835 and the second in 1840. In it, religion is considered an indirect political institution that powerfully contributes to the maintenance of a democratic republic among the Americans. Despite Tocqueville's biased portrayal of religion, which reflected his Catholicism, his sociological analysis shows that religion does not necessarily contradict democratic forms of government and the spirit of Enlightenment. For the French aristocrat, religious praxis complements and perfects the shortcomings of democracy, such as the adoption of individualism by citizens and therefore the loss of solidarity, by providing a source of morality that democracy cannot generate on its own. This model of complementary cooperation then becomes imperative within the context of a liberal model of society.

Liberalism and the Problem of Institutionalized Religions

Liberalism fulfills the project of the Enlightenment in terms of religion and politics in so far as for liberal thinkers, religion is no longer seen as an

independent and autonomous authority juxtaposed to politics. Religion is understood as being just an additional, but nevertheless important and valuable, component of society, which builds on Tocqueville's description of the role that religion plays for America's democratic society. Following the views of John Stuart Mill, expressed in his treatise *On Liberty* of 1869, the key problem addressed by liberalism is that of freedom and authority. What are the limits of governmental authority over individual freedom, and what can legitimately be called a free society? Liberalism's solution to this problem is the principle of minimal political authority—interference of the state in private affairs, and at the same time a guarantee of maximum personal freedom on the basis of the ethical axiom that individual freedom ends wherever another person is deprived of obtaining his or her own personal good in his or her own way or even is impeded to obtain it. As it is evident from the emphasis on the individual as proper subject of political theory, religions of a higher degree of hierarchical institutionalization are drawn into question more radically than those religions of a low degree of hierarchical institutionalization.

The Roman Catholic Church, as an example of a very highly hierarchically organized institution, responded to the challenge of liberal tendencies of the nineteenth century by a far-reaching retreat from an increasingly secular society and established social domains of pure religious conduct opposed to what was termed modernism. During the Pian era, the period from Pope Pius IX to Pius XII (1846–1958), the Catholic Church returned in its teachings to scholastic authorities and a political model that claimed the Church's indisputable superiority over secular politics. Backed by neoscholasticism, the unity of throne and altar had been reclaimed and directed against all inchoate forms of democratic government and parliamentarianism. Key events in the history of religion and politics during the Pian era include the *Syllabus Errorum* (1864), a list of

80 theses that condemned "errors of our time" like liberalism (§10); the dogmatic proclamation of the infallibility of the Pope in religious matters (1870) and the *Kulturkampf* in Germany (1871–78). The latter stands for a number of legal measures under the Prussian Chancellor Otto von Bismarck that were concerned mainly with civil marriage and matters of education. All these laws were directed against the authority and influence of the

Catholic Church in favor of the Protestant Churches. In the United Kingdom, the country of origin of the liberal tradition, throughout the nineteenth century the relationship between the Catholic Church and government took an opposite direction. Preceded by the Catholic Emancipation Act of 1829, liberal politics formally reinstated almost equal rights for Catholics and finally put an end to their social exclusion.

From Marx to Real Socialism

The history of the relationship between religion and socialism is as complex and manifold as the variety of existing forms of socialist models of society. Religion for Karl Marx was not of great significance. Not only did Marx's thorough-going materialism deny religious claims to reality, natural or revealed, but he viewed all cultural manifestations as part of a "superstructure" that was ultimately determined by a "base" of political economic relations. With exception of his statement that became a catchphrase, that religion is "the opium of the people" (stated in his forward to *Zur Kritik der Hegelschen Rechtsphilosophie* written in 1843–44) and his treatise *On the Jewish Question*, only few references to religion can be found in his work. According to Marxist thought, religion is an effect of, and a tool for, the oppression of the proletariat. Following Ludwig Feuerbach, Marx observed that aspects of religion represented the best of ourselves that we alienated from ourselves by projecting it onto a god. Religion will inevitably disappear once the socioeconomic circumstances have changed. To a certain extent this view anticipates future theories of secularization, and Marxism has had a significant impact on the development of the theory of secularization.

Using *socialism* as an umbrella term accommodating political theories including Marxist utopianism, communism, Leninism, Stalinism, and real or existing socialism on the one hand, and Chartism, Antonio Gramsci's Communist Catholicism (which linked Catholic social ethics with communism in their consensus on the importance of the community for society) in Italy or the Labour movement inspired by the Anglican Church in England on the other. Socialism and Christian religion are intrinsically related and diametrically opposed to each other at the same time. Socialism and religion can and have been combined to a peaceful and fruitful

blueprint for social policy making that led to the birth of the welfare state and the formulation of the principle of subsidiarity, solidarity, and personality as the three pillars of social ethics, for example. Even where socialism was largely rejected, as in the United States, the impetus for social reform found a foothold in Christian thought, such as the U.S. social gospel movement of the early twentieth century.

Other atheist forms of socialism have resulted in bitter enmity between socialist conceptions of society and religious worldviews leading to religious suppression and persecution, especially under the former communist regimes in Central and Eastern Europe. Religious institutions increasingly faced a serious enemy that had to be fought. It is a matter of fact that with the rise of totalitarian regimes like the Stalinist rule, Mao's Cultural Revolution, and also under Fascism in Italy and National Socialism in Germany, religious institutions and communities were forced either to cooperate or to disappear, with the Holocaust as the darkest moment in this conflict. For the theory of "real socialism" that emerged in the second half of the twentieth century, different models of religion and politics existed, ranging from a more or less tolerant attitude toward religion as in Hungary to the active persecution of the Orthodox Church in the Soviet Union. In the aftermath of the events of 1989, the situation changed radically. Since the fall of the Berlin Wall and the end of real socialism, various religious groups, traditional churches, as well as new religious movements began to flourish in former communist countries. Therefore, the year 1989 can also be seen as a symbolic turning point in the recent history of the relationship between religion and politics.

Religion and Democracy: Pluralism, Privatization, and Secularism

The twentieth century, particularly between 1918 and 1991, was an "age of extremes," to borrow a phrase from Eric Hobsbawm. On the one hand, democracies became the political norm and, on the other, early waves of democratization during the interwar period were interrupted by totalitarian systems. The latter and their relation to religion have been developed into a

main area of research in the field of religion and political thought and are discussed separately in the section titled “Political Religions.”

Nevertheless, the twentieth century is the century of democracy. With the triumph of democracy, the principle of freedom of religion, the separation of Church and State, and the freedom of conscience have gained constitutional status. These democratic principles became undisputed common values. In this sense, Europe followed the example of the United States and returned to its heritage of the values forecasted by the Enlightenment. The principle of freedom of religion and of conscience made it increasingly possible to choose one’s religion or even to opt for no religious belief and affiliation at all. Furthermore, the principle of the separation of Church and State put an end to the monopoly of certain religious denominations and any forms of caesaropapism, despite various local and national contractual exceptions of implicit cooperation and support.

On an individual level, democratic societies promote religious pluralism, and on a societal level, the loss of official political authority of churches accelerated the privatization of religion. Up to the turning point of 1989, religions became less visible in the public sphere and less important for the life of an increasing number of people. Moreover, traditional religious beliefs had to compete with scientific or humanist world views. Therefore, the short twentieth century is undoubtedly the century of secularism on the whole, as for example Charles Taylor has argued in his *A Secular Age* (2007).

Current Debates and Areas of Research

Despite, or perhaps because of, the movement toward a sharp distinction between politics and religion, contemporary religious thinkers have creatively engaged politics from their theological viewpoint, while students of politics have sought to consider how some political movements replicate aspects of religion. At the same time, religion has begun to appear more “relevant” to politics both theoretically, as scholars have questioned secularization theory and its Eurocentric focus, but especially practically, as the Cold War between the United States and the Soviet Union has faded and

a combination of terrorist actions, political instability, and immigration have brought political Islam to the forefront of public consciousness in Europe and the United States.

Political Theology

The phrase *political theology* was brought to attention to a wider audience by the German jurist Carl Schmitt and his publication of his book with the same title of 1922. Schmitt's understanding of political theology is still a matter of discussion, but it is clearly of a conservative nature with references to counter-revolutionary ideas. Schmitt's political theology must not be confused with the project of a "new political theology" elaborated by Johann Baptist Metz, whose work was intended to be a theologico-political reaction to the Second Vatican Council (1962–65). Metz argues for a renewed self-understanding of theology shaped by the experience of the Holocaust. Metz's explicit theological understanding of political theology attempts to address the challenges posed by secular and democratic societies from a strong ecclesiological and Christological point of view. According to Metz, it is the duty of the Church to get involved in social policy making by providing a critical voice that supports the fundamental values of democratic societies. Consequently, political theology is concerned with the suffering and the oppressed and places particular emphasis on the remembrance of the victims of the Holocaust, as the ultimate manifestation of human-inflicted evil and, theologically speaking, the denial of the will of God and humankind's hubris. This genuine option for the victims and the poor was open to be interpreted in Marxist terms of the liberation of the proletariat, which was further developed in South and Latin American liberation theology. From the Protestant side, the idea of political theology has been elaborated in terms of a "public theology." As is evident from its name, public theology is designed to overcome the privatization of religion and to reclaim political authority, mainly in terms of a partnership between the state and faith-based communities similar to the role nongovernmental organizations play in democracies.

Over the last decade the term *political theology* has also been used in combination with political Islam or Hindu nationalism. Nevertheless, it is not always clear how political theology is distinguished from religious

fundamentalism. On the whole, political theology is predominantly a theological school of thought based on the idea that political claims can be made on the basis of a theological and therefore absolute truth. The main question concerns the limits of these theologically grounded claims within the framework of a liberal, democratic state built on the rule of secular law.

Political Religions

Methodologically, the study of political religions is an offspring of the studies on totalitarianism. The first generation of researchers of the study of totalitarianism were eyewitnesses of the atrocities of National Socialism. Ernst Fraenkel's *The Dual State: A Contribution to the Theory of Dictatorship* (1942), Max Horkheimer's and Theodor Adorno's *Dialectic of Enlightenment* (1944), or Hannah Arendt's seminal work *The Origins of Totalitarianism* (1951), were all written by German emigrants of Jewish origin. The outset of the research on totalitarianism is therefore based on the analysis of the rise of National Socialism and a structural and anthropological reflection on the factual possibility of the Holocaust. A second generation of researchers such as Emilio Gentile, who wrote *Politics as Religion* (2006), concentrate on the symbolic dimension of totalitarian systems. To explore the symbolic and mythical contents of totalitarian systems, the term *political religion* was coined with reference to the early work of Eric Voegelin (1938). According to these authors, totalitarian forms of governments like fascism, national socialism, Stalinism, or Maoism cannot be understood unless the mythic and pseudoor quasi-religious nature of their political program is taken into account. These new researches into the religious nature of totalitarianism draw attention to those aspects of political movements and politics in general that have long been neglected by purely empirical studies of these phenomena.

The New Visibility of Religion

Over the last decades shaped by the political events of 1989 and their aftermath, sociological theories of secularization were subject to extensive review regarding their fundamental assumptions concerning the future of religion and the nature of religious phenomena in general. The reemergence

of religion after the collapse of communist systems has shown that the classic understanding of secularization following Max Weber is insufficient to explain and understand the social functions of religions. According to the radical secularization thesis, religion should disappear entirely as a result of a universal process of rationalization linked to the progress of modernity or, according to the Marxist version, as a result of the changing socioeconomic conditions. At least three observations have drawn the classic theory of secularization into question. First, despite the decreasing numbers of church attendance, new forms of religiosity developed. Consequently, the institutional nature of religion has been reconsidered. Furthermore, the analysis of non-European and non-Christian religions has shown that the Western concept of religion is not necessarily the most appropriate conceptual tool to describe new religious movements or other religious communities. Second, the European model of strict separation of religion and politics is called into question as a benchmark model of universal validity by the American coexistence of technological progress and advanced modernity. Finally, an increased awareness of religious fundamentalism and religiously inspired violence reopened the debate about the compatibility of secular and religious lifestyles. Of course, as Marx would have been the first to point out, this debate is not just a debate about differing and mutually excluding ideologies, but it is also a problem underpinned by economic realities.

A number of suggestions have been made to adjust the sociological theory of secularization. To describe more accurately the new situation, terms such as deprivatization of religion, postsecularity, new syncretism, and vicarious religion among others have been coined. The key problem underlying these revisions of the understanding of secularization is the difference between a so-called reemergence of religion and a new visibility of religion. Are we experiencing a factual and quantitative increase of religion, or is religion just more visible? Commonly accepted criteria need to be developed to assess the growth or decline of religion and to define what religion is and what it is not. Moreover, waves of migration and accelerated mobility pose the juridico-political question of the compatibility of secular and religious law. Within the context of secular, democratic, and constitutional states, the problem is centered around the elementary right of the freedom of religion and its exercise and minority rights on the one hand, and the dogma of

secular neutrality toward religion and cultural values on the other. From the legal perspective, the confrontation between different systems of law and their different concepts of legitimacy can be translated into the debate about the limits and appropriateness of positive law and the conformance and accommodation of law guided by religious convictions. This is best illustrated by the discourse on the possibility of what has been called Euro-Islam.

Conclusion

Since the Enlightenment, “modern political thought” has inclined toward and even been defined by secularization and the flight from religious forms of political thought. Indeed, analyses of the interactions between religion and politics have rarely been free of a political interest by the inquirer either for or against religious influence in politics. If religion is back on the agenda of political thinkers in what some consider a postmodern, post-Enlightenment context, the claim of a new visibility of religion also leads to the political question of whose interest it is to make religion more visible and in what ways the religion at stake is portrayed.

Renaissance and Early Modern Political Thought

Renaissance and early modern political thought

686

692

Renaissance and Early Modern Political Thought

The Renaissance is customarily said to have begun with the observation by Francesco Petrarca (Petrarch) in the fourteenth century that a “dark age” separated him and his contemporaries from the splendor of the ancient world. Modernity was bad, and what was needed was a rebirth of classical notions of beauty, philosophy, and politics. The movement that culminated in the Enlightenment around the seventeenth and eighteenth centuries, by contrast, viewed classical antiquity as partly responsible for the medieval dark ages that had to be overcome and so advocated a revolutionary transformation of society. What united Renaissance and early modern political thought, however, was this rejection of medieval political thought. Specifically, politics was no longer treated as the application of theology or even as devoted to the cultivation of a person’s capacity for happiness. Politics was simply about the preservation and acquisition of material goods, and this did not in any way detract from its dignity. This revolution in political thought was mostly a result of the sixteenth-century Florentine Niccolò Machiavelli and the seventeenth-century Englishmen Thomas Hobbes and John Locke.

Premodernity as the Kingdom of Darkness

Machiavelli appears at first glance to share in the Renaissance judgment that a return to ancient modes and orders is desirable. He uses the same language of accidents, necessity, fortune, virtue, and corruption. When he gives contrasting ancient and modern examples, the moderns almost universally come off as small or foolish, even when successful. One of his major works, the *Discourses on Livy*, is devoted primarily to the ancient Roman republic. Roman authors of the late republican and early imperial periods had taught Machiavelli's contemporaries to attribute political ills to corruption and a lack of virtue. Machiavelli's language reflects this strand of Renaissance thought.

In the view the civic humanists learned from their Roman predecessors, a republic is virtuous when its citizens devote themselves to the public good. In time, however, corruption seeps in and ambitious individuals stir up trouble between the classes. The people choose a champion to be their emperor, surrendering political liberty for bread and circuses. A corrupt city must either experience a rebirth of its lost ancient virtue or cease to be a republic any longer.

Although Machiavelli adopts the language of Renaissance republicanism, the ideas he expresses with that language differ in crucial respects. When Machiavelli says that republics must often be drawn back toward their beginnings or principles in the *Discourses*, for example, the beginning he has in mind is a state of fear. Fear of external enemies or of the magistrates, rather than of moral uprightness, makes people willing to sacrifice for the public good. Although calls to restore lost virtue must have a conservative or traditional hue, the reinvigorating fear that Machiavelli says must be returned to can also be brought about in the course of revolutionary change.

Machiavelli claims to bring new modes and orders, comparing himself to a discoverer of new and distant lands. He does not claim to be restoring ancient modes and orders. His *Discourses* begin by treating Livy as the guide to a Rome that should be emulated, but by the end of the first book, it becomes evident that Livy's conservatism makes him an unreliable historian. Machiavelli must change Livian stories to make Rome worthy of imitation. The Rome that Machiavelli says we should restore is not the Rome preserved in the histories. Machiavelli does not look to Rome for

inspiration but instead founds his political science on what he himself has discovered about human beings. In *The Prince*, he declares a break from all previous thinkers, whom he disparages as uselessly idealistic, devoting himself instead to the “effectual truth” of worldly things.

After Machiavelli, the dominant strands of political thought tended also to counsel the need for innovation rather than a rebirth of antiquity. This innovation in political thought was to be complementary with advances in the physical sciences.

Hobbes attempted to present his arguments in *Leviathan* as the necessary consequence of understanding human beings as simply matter in motion. False scientific theories, he argued, provided a false image of human nature and so buttressed ineffective political orders.

Locke more than anyone else became the philosopher of the Enlightenment. Although the political thought contained in *Two Treatises of Government* and *A Letter Concerning Toleration* does not trumpet a radically new understanding of human nature, and *An Essay Concerning Human Understanding* mutes its innovations’ political implication even as it breaks from medieval conceptions of human nature and morality, the Lockean corpus as a whole represents a wholesale rejection of medieval and classical thought.

The revolution sought by Machiavelli, Hobbes, and Locke was not simply in political practice, but in ideas. There is nothing novel in suggesting that political practice needs reforming. Thomas More, for example, opens *Utopia* by having his main character, Raphael Hythlodæus, lambast the flattery and deceit that pervade high politics, citing these as the reason why his wisdom does not benefit the public. More does not take the additional step toward modernity, however, by openly floating the suggestion that the true reason Hythlodæus cannot participate in politics is that what he has absorbed from the ancients has made him foolish, not wise. Much of *Utopia* is instead devoted to showing that the communism advocated in Plato’s *Republic* is indeed practicable. And although there are hints that More himself was not as keen on the Utopian system as Hythlodæus’s encomium might suggest, More’s purpose in criticizing these quasi-Platonic

institutions, unlike those of other early modern thinkers, was not to argue for a radical break from ancient political philosophy.

Legitimacy and Individual Rights

Modern political thought is strikingly democratic in its principles. Here, Hobbes and Locke had a greater impact than Machiavelli. This is not to say that Machiavelli did not have democratic leanings. He did argue that a prince should side with the people rather than with the great. His reasons, however, had nothing to do with justice or legitimacy. Instead, a founder's legacy is more secure if the poor are attached to it, and in defending the people, a politician acquires a pretext for eliminating his rivals. Those who deprive the people of political power cannot use them in war, and for that reason, the people must have a share in ruling. Machiavelli criticizes the Spartan and Venetian oligarchies for being unable to hold on to the lands they conquered, not for being oligarchies. A prince should not offend an individual's property or dignity, not because people have a right to either but because they will seek revenge.

Hobbes and Locke, by contrast, made an appeal to natural rights in grounding their political theories. These rights were shared equally by all and could be surrendered only by consent. They were natural insofar as they could be known by reason, i.e., without special revelation.

To understand the importance of the natural rights doctrine, it is useful to contrast it with medieval natural law. Natural law, too, is discoverable without special revelation, but there is no reason why it should declare human beings equal in any interesting sense. Thomas Aquinas, whose work was the paradigm of medieval thinking about natural law, followed Aristotle in suggesting that the wise have a right to rule, which would mean that the unwise have no right to withhold their consent from that rule. Natural law might establish a relationship between adults analogous to that of a parent over a child, while the logic that discloses natural rights begins from the equality of each individual, at least insofar as no one must acknowledge another as having a right to command them. Natural law is what reason declares is good for a community, demanding the sacrifice of that community's members for a good they will no longer enjoy. A focus on

natural rights means that the community must justify itself to the individual, any apparent sacrifices actually being outweighed by greater benefits to be received from the community.

Jean Bodin provides an example of an amalgam of modern and medieval political thought in this regard. Bodin broke with the Aristotelian tradition in his 1576 work, *Six Books of the Commonwealth*, by declaring that society had its origin in force and violence, not the justice or virtue of its first kings, while also asserting that a commonwealth must be founded on the laws of nature in order to be distinct from a band of robbers. Yet Bodin does not conclude from this that the societies that actually exist lack authority. Indeed, he determines the extent of sovereignty by looking to what it would mean for the sovereign to have authority. He presumes that sovereign authority exists. On this basis, he argues that sovereignty must be an absolute and perpetual power to make laws binding on others, being accountable only to God for the exercise of that power. He does not argue, as Hobbes and Locke would later do, that submission to authority is good for the individual, for he does not present sovereignty as standing in need of any justification. God established sovereigns through which His laws might be executed.

Both Hobbes and Locke begin with the premise that authority does not exist by nature or divine dispensation. If one human disobeys another, the first might be imprudent, but he or she cannot rightly be said to be rebellious, and punishment if any can be only for the harm caused, not for disobedience. Every political community by contrast has a hierarchy of some kind, which is to say, authority the disregard of which is in itself punishable. A political community does not, therefore, exist by nature. By nature, individuals are free to act in whatever way seems best to them. The state of nature is anarchic.

Political authority may not be natural, but it is nonetheless desirable. Hobbes and Locke agree that without an enforced, positive law, people experience physical misery that outweighs the pleasure of deep autonomy. Locke suggests, contrary to Hobbes, that one can speak of right and wrong in the state of nature, but this natural justice is so poorly enforced that it might as well not exist. For both, the escape from the state of nature is

imperative. Each individual must consent, therefore, to surrender his or her freedom and submit to an authority who has no rational right to rule other than their people's arbitrary choice of them as their ruler.

In neither Hobbes nor Locke does this democratic principle of natural rights lead to a democratic form of government, although the groundwork for democracy can be seen. Hobbes said that rule by the people could be legitimate, but historical evidence of actual democracies suggests that domestic peace would be better served by a sovereign monarch. Locke also suggests that any form of government might be legitimate (except one that claimed a right to mistreat the people). The people have a right to certain legal protections, and certain of these protections, most notably those regarding private property and taxes upon it, can be altered only with a further act of consent by the people. Beyond these constraints, however, the Lockean commonwealth can adopt any constitution it sees fit.

The sovereign authority, however many people share in it, disappears only when it fails to do its job, namely, to keep the individual safe. One example of such a failure is levying of a kind of war on the people. Hobbes mentions briefly in *De Cive* that this might justify revolution but drops this possibility entirely from *Leviathan*. It is more important for Hobbes that people be brought to obedience than that all the exceptions to authority be made plain. For Locke, by contrast, the people are *too* prone to obedience. Locke, moreover, was writing to justify a particular revolutionary act. (That conspiracy was broken up and Locke was forced into exile after the discovery of the Rye House Plot. He published his *Two Treatises of Government* years later as though it had been written to justify a different revolution, the Glorious Revolution.) Locke therefore addresses the dissolution of political authority at far greater length and emphasizes that the people may treat their governors as public enemies if the latter so much as maneuver themselves into a position where they might become public enemies. One need not wait until the ship reaches Algiers, Locke intones, to determine that the captain intends to sell the passengers into slavery—and act preemptively to stop it. The subsequent transformation of the doctrine of natural rights into an argument for democracy required only the empirical observation that democratic forms best prevent the kinds of abuses that would justify revolution.

Politics as Independent From Theology

Premodern writings on politics encompassed a great deal that we would not now consider to be political. The dominant tendency in the Middle Ages was to treat politics as a subfield of theology. God's law was the source of valid municipal and international law and of guidance for those confronted with invalid laws or rulers. The question was not one of how to organize society in general, but of how to organize a society of Christians, and this meant that the political question came to be one of how to organize a church. In the early modern period in England, authors who cleaved to the premodern conception of politics, such as the Anglican theologian Richard Hooker, spoke about secular politics in the course of describing the "ecclesiastical polity." Modern political thought is characterized, in contrast, by its proclaimed separation from theology.

The separation of politics from theology does not necessarily mean that politics must be separate from religion. Machiavelli, for example, argued in both the *Prince* and the *Discourses on Livy* that the rulers would find it useful to manipulate religious beliefs. Similarly, Hobbes said in *Leviathan* that the sovereign was the ultimate arbiter in matters of religion.

In both cases, however, political considerations trumped religious ones. Machiavelli did not argue that Christianity demanded that it be manipulated to the ruler's profit. Hobbes said that political stability would be enhanced by the sovereign's imposition of religious uniformity. Religion was a powerful force in politics, and differences in religion led to civil wars. Some scholars claim that the wars and revolutions arising from religious discord were the primary motivation in the development of Hobbes's support for absolute monarchy. Hobbes did make gestures in the direction of providing biblical support for his theory, but practically no one believed these to have been sincere at the time, and only a minority of scholars have come to defend Hobbes's piety. Politics had a logic all its own, not one subordinate to theology, even if that political logic could justify controlling religion.

Machiavelli is renowned for counseling deception and violence in the pursuit of power, more obviously in the *Prince* but also in the *Discourses*

on *Livy*. What he objects to is their incompetent use or half-measures. He gives as an example one Giampaolo Baglioni, a tyrant who had murdered his cousins and nephews and who was involved inappropriately with his sister, but who balked when it came to killing the Pope and all the cardinals, even though that would have preserved his rule over Perugia and, Machiavelli insists, gained him an eternal memory for greatness that would have surpassed any infamy that might have arisen from the deed. Machiavelli never speaks of hell or of the soul, even to assure his readers that his counsel will not send the latter to the former. Religious considerations seem to be completely foreign to his thinking. He occasionally says of a certain subject that it is too exalted for the human mind to comprehend, but he shows no hesitation in immediately discoursing on matters that would require comprehension of that exalted subject if he thought theology relevant to politics.

Hobbes based his arguments for absolute monarchy on natural law, a theory with deeply religious overtones. Aquinas had suggested that some of God's demands for humanity were knowable through the natural faculty of reason without any special communication from God. Natural law was that part of divine command that human beings could figure out for themselves. Hobbes suggests that human beings do come to know the natural law through reason, but he is explicit that what reason discovers cannot properly speaking be called a law at all, let alone a law known rationally to have been commanded by God. And what reason teaches, according to Hobbes, is that, in the absence of any secular enforcement of human authority, everyone has a right to everyone and everything, including to kill preemptively. The law of nature on which Hobbesian political theory is built is divorced from traditional theological principles. Those who see Hobbes as continuing within a Christian tradition situate him among those who, like Augustine, view theology and faith as suprarational and so as lying outside of the rational inquiry into politics, or among those who say that saintliness grants no political authority and so lies outside the considerations of political theory. The logic of politics proceeds without reference to Christian principles. Natural right replaces natural law.

It is Locke who transformed the separation of political theory from traditional theology into the separation of church and state. Although some

scholars question whether Locke's political arguments rest on his theological ones or even whether he was seriously religious at all, it is generally recognized that he was among the first successfully to argue that politics and religion represented two nonoverlapping spheres of life. Churches, he argued in the *Letter Concerning Toleration*, could not demand civil penalties for unorthodox religious belief or practice. Civil magistrates could not have any concern beyond the maintenance of public order. Contrary to Hobbes's assertion (and Locke's own earlier, unpublished arguments), an imposed uniformity of religion did not serve the goal of public order. The civil magistrate is to intervene in religious affairs only when they threaten political goods, such as when a church claims that no obedience is owed to heretical magistrates or attempts to turn the civil power to the persecution of religious enemies. The state tolerates any church that restricts itself to private, salvific concerns, and only those churches.

Baruch Spinoza had earlier argued in the *Theologico-Political Treatise* for a religious toleration so broad as to include all speculative philosophy within it. In this way, religion would be deprived of the weapons of state in suppressing science that was at odds with tradition. But his arguments in this direction seemed to involve the refutation of scriptural authority altogether, and when the Bishop of Worcester wished to defame Locke for *An Essay Concerning Human Understanding*, he named him a follower of Hobbes and Spinoza.

It was not clear from the outset why the civic humanism that characterized Renaissance political thought could not also be a kind of Christian humanism. Whatever the possibilities, Machiavelli made no effort to combine Christianity with clear-sighted political investigations. Whether or not he, and Hobbes after him, believed that political theory did not have to follow Christian theology because that theology was manifestly false, they did act as though political theory was best pursued independently from theology. Locke's relationship with Christianity, by contrast, is more complicated. On the one hand, he devoted a great deal of energy to reforming Christianity so that the independence of political thought might be religiously palatable. On the other hand, the beliefs outlined in *The Reasonableness of Christianity* are those that can bow to a roughly

Hobbesian political order, and the civil magistrate is to compel conformity to whatever religious scruples permit one to bow to such an order.

Political Hedonism

Early modern political thought is founded on a kind of hedonism. Hobbes and Locke explicitly justify political society on the basis of what conduces to the avoidance of physical discomfort (in *Leviathan* and *Two Treatises of Government*, respectively). Just as society is not for the salvation of the soul, neither is it for the cultivation of virtue, and they do not ask whether a life of bourgeois industriousness is fundamentally satisfying. Politics for both is solely about what Hobbes called commodious living and Locke, the preservation of life, liberty, and estate. The psychology that each presents makes pleasure and pain the sole determinants of human action and belief (Hobbes in *Leviathan* and Locke in *An Essay Concerning Human Understanding*). Those inspired by the civic humanism of the Renaissance continued to speak of virtue in the early modern period and feel that politics was threatened most by corruption, but these politicians and pamphleteers did not have the lasting intellectual impact of Machiavelli, Hobbes, and Locke. Virtue, as devotion to the public good and regular habits, sustained the community and led to personal success. This was not the otherworldly virtue of the Christian saint, but neither was it the superb virtue of the Aristotelian gentleman, which led to happiness rather than to worldly success and did not simply make one a good citizen. Virtue as understood by the moderns was open to the subversive suggestion that it was either foolish sacrifice or merely material self-interest well understood, and the rhetoric of virtue slowly faded.

The hedonistic underpinnings of their philosophy partly explain why politics is not natural for either Hobbes or Locke as it was for Aristotle. A human being's possession of reason, Aristotle had argued in the *Politics*, engenders a desire for a community bound by shared opinions of the good, just, and advantageous, and in this way the political community called the city differs from any hive or herd, or even family or village, which societies came into being in order to meet routine physical needs. The human desire for happiness results in a directedness toward a more robust political life than just being good neighbors, and Aristotle's one-line rejoinder to

Lycophron's social compact theory is that the result of that compact would not suffice for a true city. The political society that Hobbes and Locke legitimate is not a city in the full Aristotelian sense, but it does not have to be, for in their view the Aristotelian city is not necessary for human happiness. Reason for both Englishmen is an instrument for the satisfaction of our desires, not an independent source of longings, and those desires are those of the body, not of the soul.

This break from Aristotle was prepared by Machiavelli. The reason he gave in the *Discourses on Livy* for the necessity of a periodic return to the beginnings of a republic is that republics are not natural bodies with a coherent purpose that they naturally strive to accomplish but are instead mixed bodies. Republics are composed of disparate elements whose natural tendency is to move away from one another. Things may have an inclination to move toward their natural end, but that end for individuals is not the common good, and so only force can bring or keep individuals together. Human beings are reliably moved by threats to their physical well-being because that is where their true good lies. The Roman nobility, which claimed to care more for honor than for comfort, in fact surrendered all of its political prerogatives to defend its property. Men will forgive the murder of their father, Machiavelli says in the *Prince*, but not the seizure of their patrimony. Machiavelli never suggests that the desire for glory that motivates great princes and republican leaders is sensible.

Renaissance and early modern political thinkers were not the first to deny that politics was natural or to suggest that goods other than pleasure were illusory or reducible to pleasure. Premodern hedonists, however, did not have political programs. The government of Utopia was directed toward pleasure, and the Utopians were hedonists, but More glossed at the end of the book that such a system was contrary to human nature and dignity. He was a part of a receding tradition that recognized that such a system could not actually work and so considered itself speculative rather than prescriptive when it came to politics and morals. The novelty of modern political thought was the idea that one could have a functioning and fulfilling political order that did not appeal to something higher than material needs and desires. Modernity can be said to begin when this idea came to be the center of political thought, either as a guiding principle or,

with greater intensity as modernity progressed, as what had to be struggled against.

Representation

Representation

692

693

Representation

Representation is the foundational concept of modern politics. The search for a form of representative government suitable to advanced societies of the size, complexity, and diversity of modern states is definitive of modern politics itself.

The question of political representation played a critical role in the American and the French revolutions, which generated the first large-scale republics founded on a representative principle. For all their differences, Emmanuel Joseph Sieyès (1748–1836) and James Madison (1751–1836) believed that properly modern government was representative government, and representation was not a second-best form of government to democracy but an improvement on it. It was consistent with the principle of popular sovereignty, but free from the excesses of crude democratic politics. It derived from the consent of individuals, but elected representatives could act as trustees, exercising their judgment in the interest of the whole.

By the nineteenth century, the democratic pressures on representative government mounted. The utilitarian movement asked for the extension of franchise, secret ballots, regular elections, and stronger popular control over representatives, seen as self-interested individuals, no different from everyone else. But the attempted reduction of representatives to mandated delegates met resistance. For John Stuart Mill (1806–73), only representation could make democracy safe for the world. It provided a protection against mediocrity, interest-based politics, and the threat of

democratic majorities, provided that different views in society were proportionally represented, and representatives remained free to exchange views in Parliament, and accept the force of the best argument.

At the turn of the twentieth century, representation by notables, unbound by the wishes of those who elect them, and free to vote in Parliament according to their personal judgment, gave way to party-based representation. This made politics more bureaucratic, more interest-based, more deal-oriented—in other words, less deliberative. Politics also became more plebiscitary, with party leaders using the party's machine to reach out beyond a partisan base, and gain the acclaim of the masses. At times, this was done through a direct form of voting affirming or rejecting a leader or a reform (i.e., a referendum), but the system must be understood more widely as a system of acclaim based on a charismatic form of authority.

The demise of the mass party, in the mid-1960s, coincided with the rise of the media, which has allowed for a re-personalization of representation that often explores the populist presumption of a direct relation between the leader and the people, regardless of the platform on which he or she is elected. In the process, parties have found themselves reduced to vehicles of a personal vision of leadership and competing with civil society groups as instruments of engagement and representation.

These transformations have challenged prevailing theoretical views on political representation. This is especially true of the standard account of representation as a principal–agent relationship, where the principals—individuals aggregated in constituencies formed on a territorial basis—authorize, through election, agents to “stand for” and “act on” their interests, and hold them accountable in subsequent elections.

Some question the territorial nature of the constituency, in view of the growing political relevance of nonterritorial issues, such as the environment. Others note its present bias, and point to the necessity of extending the notion of representation to encompass future generations. A third group of critics argues that the conception of principals as formally equal individuals leaves existing patterns of marginalization unaddressed and chronically underrepresents historically disadvantaged groups, which form relevant nongeographical constituencies. Another set of concerns is

raised by deliberative democrats, for whom the standard account reduces political judgment to the aggregation of private preferences, and undermines their favored conception of representation as an ongoing relationship between constituency and representative, within which the constituency, its interests, and identity are constituted, rather than merely reflected. Finally, the emergence of new, nonelective, forms of political representation, operating outside of formal procedures of authorization and accountability, have reopened the question of what constitutes a representational relationship, and have called for conceptual innovation. This has led to attempts to derive normative accounts of representation from the specific functions different kinds of representation fulfill, and to the introduction of new typologies of representation, beyond the classic distinction among formalistic, descriptive, symbolic, and substantive forms of representing (Pitkin 1967). How these new forms of informal representation work with electoral representation, and with one another, is a question for the future.

Another emerging area of research concerns the relationship between representation and democracy. Historically, representation has been seen in opposition to democracy. But the view of representative democracy as a mixed regime composed of democratic and undemocratic components is being opposed by those who believe that it forms a democratic model in its own right. The study of the conditions that enable representation to be democratic will occupy us in years to come.

Republicanism

Republicanism

693

694

Republicanism

Republicanism, or “civic republicanism,” is a political tradition that focuses on the values of freedom and the common good. Freedom is understood as politically realized among interdependent citizens who are self-governing, rather than being a natural property of individuals. As members of a political community, rather than any prepolitical community, citizens share a common good.

Republicanism is not identical to either pure democracy or the absence of monarchy per se. It entails rather the rule of law, a balance among social forces or institutions, and the engagement of citizens disposed to support the common good, displaying “civic virtue.” Thus, republicans address both concerns for freedom and the common good, rights and duties, and corresponding fears of the dangers of tyranny and corruption. They stress the importance of civic and political participation, although there is disagreement between two main strands of republicanism on whether such participation is valuable intrinsically or instrumentally. Thus, although republicans agree that freedom requires more than the absence of immediate interference, they disagree on whether it is to be understood in a more positive sense of self-realization through political activity, or as nondomination, constituted through a legal status that gives citizens secure protection from arbitrary interference by the state and other agents.

Although it is, therefore, a contested theory, characterized by considerable internal diversity, republicans share a distinctive cluster of values, however

differently they frame them, namely, freedom, participation in self-government, and commitment to the common good.

With Greek and Roman antecedents—the term comes from the Latin, *res publica* (the public concern, formerly translated as “commonwealth”) —“classical” republicanism emerged in early modern Europe, articulated by such figures as Niccolò Machiavelli and James Harrington. This view was more aristocratic than democratic, and the civic virtue of citizens had a distinctly military and masculine character. Its modern expression was developed especially by the contrasting eighteenth-century thinkers James Madison and Jean-Jacques Rousseau. Their thought influenced the American and French revolutions and subsequent republics. Madison, in the *Federalist Papers*, boldly redefined a republic as government through representatives, as opposed to the direct popular rule of a democracy. Rousseau’s republicanism, in contrast, focused on the ideal of a small sovereign people, who would be free because they were self-governing, even if he saw little prospect of its realization in the modern world of nation-states. Mary Wollstonecraft outlined an account that included women as equal citizens.

In the nineteenth century, republicanism was somewhat overshadowed by the younger tradition of liberalism, to which it contributed. The term “republican” was applied to a range of movements that interpreted and prioritized freedom and the common good in a variety of ways. French republicanism came to be characterized by a unitary conception of the state, an unmediated relationship between the state and the autonomous individual citizen, and an emphasis on rationality and strict secularism (*laïcité*) in public affairs. In Ireland, republicanism connoted primarily a militant nationalist movement. The connection of the U.S. Republican Party, so named in 1854 to evoke Thomas Jefferson’s legacy for the new antislavery party, is mainly historical.

Republicanism experienced a significant revival in the late twentieth century, after the collapse of the socialist alternative in practice and in the wake of the liberal–communitarian debate that dominated Anglo-American political philosophy in the 1990s. This revival saw the articulation of two strands of republicanism, both invoking historical antecedents. One,

expressed by thinkers from Hannah Arendt and J. G. A. Pocock to Charles Taylor and Michael Sandel, emphasizes the value of political participation as realizing freedom and shared goods. This perspective is sometimes called “neo-Athenian” or “civic humanist” by its critics, but some thinkers in this strand lean toward communitarian positions, and others toward liberal ones. The other strand, “neorepublicanism,” articulated primarily by Philip Pettit and Quentin Skinner, develops the idea of freedom as nondomination, secure protection from the threat of arbitrary interference by the state. Although the latter strand requires institutions that encourage accountability and contestation of power, it does not attribute intrinsic value to political participation.

Republican thought, while still developing, has faced a variety of criticisms. Critics of the contemporary revival argue that it cannot escape its historical legacy of elitism and militarism, or its masculine model of citizenship. Others argue that insofar as contemporary republicanism has avoided these features, it does not differ significantly from liberalism. Liberalism, however, takes many forms; contemporary republicanism may be best understood as contrasted to libertarian theories of the self-sufficiency of individuals, freedom as the absence of interference, and the idea that government is the principal threat to individual freedom.

Revolution

Explaining how and why revolutions happen has been an abiding concern of political thinkers, historians, and social scientists since at least the nineteenth century. But attempts at explanation have produced little consensus. There is always a temptation to answer the question in a simple way—something like: “Revolutions happen when people are oppressed, and organize to overthrow the system of their oppression.” But any cursory review of the literature on revolutions will show that such a causal statement will not do. Many oppressive social systems do not experience revolution, while revolution sometimes springs up where social conditions are relatively benign. And within a given society, it is sometimes not the most oppressed groups that lead revolutions but relatively privileged ones. So it is not clear that any simple statement can give even a parsimonious answer to the question of how or why revolutions happen.

Defining Revolution

Political scientist Samuel Huntington defined revolution in 1968 as “a rapid, fundamental, and violent domestic change in the dominant values and myths of a society, in its political institutions, social structure, leadership, and government activity and policies. Revolutions are thus to be distinguished from insurrections, rebellions, revolts, coups, and wars of independence” (Huntington 1968, 254).

But Charles Tilly, a pioneering scholar of revolutions and social movements, argued that no revolution meeting this definition had ever happened. Tilly defined revolution in 1993 as “a forcible transfer of power over a state in the course of which at least two distinct blocs of contenders make incompatible claims to control the state, and some significant portion of the population subject to the state’s jurisdiction acquiesces in the claims of each bloc” (Tilly 1993, 8).

However, some scholars suggest that Tilly’s definition places too much emphasis on power struggle and not enough on change—asking whether, if there is no meaningful change after the power struggle, there can really have been a revolution at all.

Such fundamental change is central to the definition used by Theda Skocpol, perhaps the best-known sociologist of revolution. Distinguishing “social revolutions” from “political revolutions,” in 1979, she defined the former as “rapid, basic transformations of a society’s state and class structures . . . accompanied and in part carried through by class-based revolts from below” (Skocpol 1979, 4).

But this definition also is contested. Some have asked whether all of Skocpol’s paradigmatic cases of social revolution (France, Russia, and China) really brought about as much social change as this definition suggests. And some have suggested that revolutionary coalitions may be based on identities other than class.

Revolution has also inspired much political thought beyond the academy. For Karl Marx, revolution was, first, the mechanism by which history moved from one stage to another, as the evolution of society’s economic base made obsolete the existing relations of production (the system determining who and which class controls what, and how), and led ascendant classes such as the bourgeoisie to usurp them for new ones. Second, revolution was also the means by which capitalism would ultimately be overthrown to make way for the next stage of history, socialism, which would eventually metamorphose into a stateless communist society. Marx also suggested that socialist revolution would occur only after capitalism had been allowed to develop fully—and that it would be led by the offspring of that capitalist development, the organized

industrial proletariat. But scholars of revolution point out that it is difficult to identify any revolution ever occurring along these lines—even among those revolutions that have birthed nominally Marxist regimes.

Many of these revolutions have occurred in societies where capitalism was underdeveloped, where peasants and artisans were more important than Marx's proletariat to the revolution, and where small cadres of intellectuals and militants intervened to guide the revolution along "Marxist" lines. Marxists have struggled with these paradoxes ever since.

Emergence of the Modern Idea of Revolution

Clearly, revolution presents major definitional, conceptual, and theoretical challenges. It has existed as a concept as much as an objective category, and that concept has evolved and shifted in meaning over time.

The French Revolution was a landmark in the emergence of the modern sense of the term. Revolution from then came to be associated with rupture, innovation, and change. Scholars such as William Sewell pinpoint this concept of revolution to July 1789 when contemporaries sought a way to frame the dramatic and disorienting events they were experiencing. Some scholars argue for earlier pedigrees to the modern revolution, in the 1688 Glorious Revolution in England, or in the 1776 American Revolution, but one thing is clear: It is widely held that a distinctively modern kind of revolution emerged at some point in the eighteenth or perhaps seventeenth centuries; that this modern kind of revolution was felt to have something fundamentally to do with rupture, innovation, and change; and that this marked a break with an older sense of the term, which could mean simply a passively experienced turn of events, the coming full circle of events, or a change in fortunes for a state or ruler.

However, associating revolution with rupture, innovation, and change raises its own questions. The notion that the invention of revolution in the seventeenth or eighteenth century marked a break with the past, facilitated by the Enlightenment, is clearly intertwined with broader notions about modernity, and the break with the past that it is held to have represented

around the same time. Indeed, episodes such as the French Revolution are often treated as fundamental to the development of modernity.

These perspectives on the emergence of revolution and modernity suggest a present that is built around regular, dynamic, and expected change, and a past in which it is custom, tradition, and the reproduction of the status quo that are expected, rather than change. A difficulty with this is that it implies a premodern past in which change did not happen.

In Marxist thought, this perspective has been expressed in terms of a withering critique of premodern and preindustrial revolts, associated with peasants acting in defense of a status quo ante, rather than advancing any progressive project.

The notion that modernity heralds an “age of revolutions” and that before this there were only various types of “rebellion” demands interrogation. It also raises a fundamental question about the meaning of revolution itself and about why it is singled out for special treatment from other types of rebellion, revolt, and sedition.

It is not always clear on which bases these distinctions are made. The idea that nothing like revolution ever happened independently of Western modernity is questionable. Anthropologists attest that the roots of many egalitarian peoples lie in revolt and secession from more hierarchical groups, while ancient complex societies from Sumer to Rome were stalked by the specters of popular and slave rebellion. Middle Ages China was racked by almost constant peasant rebellions with some ruling dynasties having their origins in successful ones. If such a wide spectrum of rebellion has been a feature of human civilization for so long, we must ask again about the putative “newness” of revolutions. Some scholars argue that revolutions only became possible with the emergence of the modern state. But this raises questions about how to define the modern state and about how the “stateness” of eighteenth-century France trumps that of Ancient Rome or Middle Ages China.

But although phenomena resembling revolutions may, objectively speaking, have happened before, it is clear that from at least the time of the French Revolution, a newly minted *concept* of revolution provided people with

new ways of thinking about sovereignty, about how political orders are constituted, about change, and of course, about rebellion against the status quo.

Sewell argues that this concept started to emerge after the storming of the Bastille and that an improvised idea of revolution was used to justify this event, while similar acts of violence that followed in its wake were condemned. In fear of the situation in Paris getting out of hand, but unable to condemn the popular attack on the Bastille, members of the assembly declared it an act of revolution—a sovereign act of the people that transcended everyday norms and laws—while declaring other similar acts mere mob violence that threatened to tarnish the revolutionary meaning of the storming of the Bastille.

Theorizing Revolution

Sewell and Doug McAdam argue that the events of 1789 in France gave the world a new “master template” of revolution, which was copied and modified elsewhere and later. From this point of view, the French Revolution provided a recipe for “constitutional revolution,” in which a state is reconstituted around a national assembly that receives its mandate and its political legitimacy from “the people,” in whom sovereignty is held to reside. Subsequent modifications on this master template of constitutional revolution are posited to include the “Bolshevik revolution” variant improvised in Russia, and then modified again in China and various Third World settings; the Islamic revolution variant pioneered in Iran in 1979; and the “people power” variant that emerged in 1989 to founder the Eastern Bloc.

Seen this way, revolution is not just an objective category with a distinctive empirical signature but a phenomenon that is defined as much by how participants conceive of it and experience it subjectively. Others have taken a different approach to conceptualizing revolution, arguing that too many scholars have mingled their theories about how revolutions happen with the stories that revolutionaries tell and that, tautologically, they have built causal statements about revolution into the very definitions of revolution they have used. Alexander J. Motyl suggests that there has been great

confusion over how to conceptualize revolution and whether it is really defined by upheaval, by turmoil, or as he makes the case, by change.

It is hard to deny Motyl's charge that some conceptualizations of revolution have been fuzzy. Scholars routinely distinguish between "political" and "social" revolutions and sometimes between the "great" revolutions (such as in France, Russia, and China) and the rest. But it is surprisingly rare for the distinctions between these concepts to be clearly elaborated.

Furthermore, struggles for national liberation and against colonialism, as well as a host of other types of social and political conflict, are increasingly claimed as types of revolutions, but relatively little attention has been paid to seriously attempting to conceptualize or theorize these categories or to attempting to relate them to relevant existing literatures and theories on nationalist mobilization, anticolonial struggle, and other forms of collective action and political violence that lie outside the specialist literature on revolutions.

Most of the energy of sociologists of revolution has instead gone into developing causal theories of revolution—whether defined as social, political, or otherwise—and into analyses of how revolutionary processes unfold once their causes have put them into motion. A good deal of energy has also gone into debates over rival paradigms of revolutionary theory—the key axis here being, roughly speaking, that between scholars mostly concerned with "structural" and state-centered explanations of revolution, on the one hand, and scholars more interested in the role of "agency" and of culture, on the other.

Within the sociology of revolutions, scholars regularly distinguish between several different generations of revolutionary study since the start of the twentieth century. The first generation, emerging in the 1930s, is often called the "natural history" school. This approach is associated with the drawing of biological and epidemiological analogies in identifying recurring patterns of revolutionary processes rather than with serious causal analysis of why such patterns emerge. This approach has long been seen as outdated, but the work of Crane Brinton is still appreciated for its pioneering commitment to the comparative study of revolutions and to its astute identification of recurring patterns across different cases.

A second generation, more closely tied to the social sciences than the first (many of whose cohort were historians), and with its heyday in the 1960s, is associated with more explicitly causal analysis. Huntington identified revolution with modernization drives; Ted Robert Gurr fingered “relative deprivation” (often compared with Marx’s “immiseration”) as the key to revolution; relatedly, James C. Davies theorized the path to revolution as a “J-curve” along which collective actors respond to economic depression or reversal of fortunes after extended periods of growth and rising standards of living. However, this generation’s causal statements came to be seen as monochrome and unsatisfactory from the point of view of the third generation.

The work of the third-generation scholars, from the late 1960s on, has come to define the study of revolutions ever since, while a much-vaunted “fourth generation” has not yet clearly crystallized. Prominent third-generation pioneers were committed to comparative historical sociological approaches, carried out at a macro level, and emphasizing the decisive role of social structures, from changing economic forces, to state institutions, to the relations between classes.

Barrington Moore argued that particular conjunctures among levels of economic development, integration into world markets, and relative power of social classes—and particularly local bourgeoisies—propelled societies alternatively toward democratic or authoritarian communist or fascist revolutions. Moore’s student, Theda Skocpol, built on this perspective considerably. In her comparison of the “great social revolutions” of France, Russia, and China, she identified the vulnerability of “agrarian bureaucracies” to revolution as they struggled to compete economically and militarily in the interstate system with more developed states. In bringing attention to this international dimension to revolutionary causation, Skocpol traced the repercussions of war and deficit military spending on state finances, and the potential for ensuing fiscal crises to touch off elite conflicts over who would pick up the bill. And although Skocpol sought to highlight the key role of peasants, as well as some urban artisanal groups—rather than a Marxian proletariat—in driving these revolutions, she was careful to point out that peasant discontent does not explain revolution. For although peasant discontent is a constant, revolution happens only rarely.

Revolution in an agrarian bureaucracy is explained, then, by the conditions that allow that constant flow of discontent to break its levees and become revolutionary. This is where elite conflict and the ensuing incapacitation of the establishment and of the state come in.

Skocpol's insistence that revolutions cannot be explained just by looking at revolutionaries, and require attention to institutions and their breakdown, has been highly influential in turning attention toward elite conflict and state crisis in the study of revolutions. The "state-centered approach" that she shaped has gone in several different directions, emphasizing variously the relative autonomy of different states from the interests of social groups; the relative capacity of states to get things done with or without social consent; the political opportunities opened up for revolutionaries in moments of state incapacity; and other aspects of the relationship between state and society.

Although Skocpol focused on revolutions in "agrarian bureaucracies," other statisticians have honed in on the vulnerabilities of other types of states. Focusing on twentieth-century Latin America, Timothy Wickham-Crowley argued that the only successful revolutions there were carried out in isolated "mafias" such as Fulgencio Batista's Cuba and Anastasio Somoza's Nicaragua—corrupt and kleptocratic polities that barely met the criteria of modern states, with thin social bases and weak state infrastructures.

Jeff Goodwin has observed similar patterns of state vulnerability to revolution in "sultanistic" dictatorships in other parts of the twentieth-century Third World, as well as in parts of the Third World where colonial powers chose to rule directly, rather than through the co-optation of local elites. Goodwin pointed out, across both contexts, that if regimes employed exclusionary, indiscriminate, and brutal repressive tactics in the face of political dissent, but lacked "state infrastructures" strong enough to quash such dissent entirely or everywhere, then they were likely to make the radical opposition of revolutionaries seem more plausible than moderate, reformist opposition, and to drive critical masses of terrorized people into support for the revolutionaries.

Jack Goldstone built on Skocpol's structuralist approach to revolution in a different direction. Surveying several hundred years of history, Goldstone

argued that demographic factors have been key to revolutionary causation. Goldstone identified two great waves of revolution in Eurasian history since the Middle Ages, both coinciding with significant waves of demographic growth: one from about 1580 to 1650 and another from about 1770 to 1870. Goldstone argued that demographic increases can fuel social conflict when both elite and nonelite elements find themselves competing over economic resources and opportunities that fail to grow at the same pace as demographic increases—a “shrinking pie” problem. Goldstone also argues for the salience of this perspective in the context of the dramatic demographic growth seen in the late twentieth and early twenty-first centuries.

Scholars such as Goldstone and Goodwin have acknowledged the need to integrate broadly structuralist perspectives such as their own with approaches to revolution concerned with the roles of agency and culture. William Sewell, Eric Selbin, Lynn Hunt, and Forrest Colburn have been among the scholars associated with such approaches and are sometimes referred to as the “French cultural school” for the association of their work with studies of the French Revolution and of the role of specific ideas and ideologies in shaping various revolutions.

All have been criticized by structuralists for the purported shortcomings of their work. Wickham-Crowley has suggested that explaining individual revolutions on the basis of local peculiarities of culture or agency is a retreat to national exceptionalism and an exit from the social scientific project of developing generalizable theory.

However, at least one member of the French cultural school—Sewell—has engaged directly with the debate about structure and agency long running in social theory and has, to a large degree, designed his theoretical approach to revolution as a way of integrating the two perspectives. Taking off from Fernand Braudel’s famous distinction between the *longue durée* (the temporality of the long-term and of slow-to-change social structures) and of *histoire événementielle* (the temporality of everyday turns of events), Sewell posits dramatic and highly contingent events like the storming of the Bastille in July 1789 as moments in which the membranes between these long-run and short-run temporalities rupture—when old certainties are

toppled by infectious outbursts of popular agency and by the pace of events, and the structures of everyday life are changed rapidly as a result.

Other scholars of revolution have also attempted to integrate perspectives on structure and agency. Goldstone, Wickham-Crowley, and John Foran have all attempted to find a place for cultural factors—such as the presence of a popular rebellious culture—within multicausal models of revolutionary causation that, otherwise, are basically structural.

These attempts to push forward revolutionary theory have not clearly birthed a distinctive fourth-generation perspective in the sociology of revolutions. But salient theoretical developments are now occurring on the boundaries between the sociology of revolutions and related fields such as the sociology of social movements.

Although the boundaries between such fields have always been porous to some degree, since the late 1990s, the calls to bridge them have been growing in volume. In the background has been concern that fragmentation in the social sciences has led to duplication and overlap, as scholars tried to explain similar problems from different vantage points without meaningful dialogue across these. McAdam, Tarrow, and Tilly's 2001 coinage "contentious politics" is now often used as an umbrella term for everything from social movements, to ethnic conflict, to revolution, implying that similar dynamics and "mechanisms" can be found in all these cases.

Some recent theoretical developments coming from this blurred zone could have implications for the debate about structure and agency in revolutions. Attempts to move on from structuralism have led some scholars to turn their focus to strategic action or strategic interaction. These approaches to contentious politics place as much emphasis on the agency of "challengers" in *creating* opportunities for themselves as it does on those challengers' ability to take advantage of opportunities that appear thanks to structures beyond their control. Such approaches emphasize the contingent nature of these processes, positing that outcomes in contentious politics can rarely be predicted because so much depends on the interplay of different political actors and since one strategic or tactical move necessarily shapes its response.

This framework would raise difficult questions for the study of revolutions. More structuralist revolution scholars have often suggested that, if agency and contingency have a role in revolutionary analysis, it is more in explaining the twists and turns of postrevolutionary trajectories than revolutionary causation. Many scholars have also suggested that the only revolutions worth studying are ones that are “successful.” This criterion has been explicitly built into many definitions of revolution—the implication being that successful revolutions, on the one hand, and “attempted” or “failed” revolutions, on the other, are of entirely different species, requiring different tools of analysis. (In contrast, whereas a revolution is often only considered to be a revolution if it is successful, a social movement is considered to be a social movement whether it fails or succeeds.)

A strategic action or strategic interaction perspective would compromise this approach to revolution in that it would see revolutionary success as contingent on the choices and stratagems of challengers and incumbents—*not* as predetermined by the largely structural circumstances to be found at the episode’s outset. This would imply that rather than being its own essential category, revolution is only separated from attempted or failed revolution by a fine line. Taken to its logical conclusion, this line of reasoning could easily suggest that the lines between revolutionary movements and other social movements are potentially just as fine.

Revolution Today

Beyond purely intellectual vagaries, recent real-world events have raised their own difficult questions for the study of revolutions.

The events of 1989 presented an awkward case for revolution specialists in that the popular uprisings that toppled regimes across the Eastern Bloc looked much like revolutions but fitted idiosyncratically with theories about how revolution comes about. The states affected were neither agrarian bureaucracies, nor colonies subjected to direct imperial rule, nor (in most cases at least) sultanistic or mafiacratic dictatorships. Preexisting cultures of opposition had seemed weak, the states had seemed strong and stable, and when the uprisings came, they were (mostly) remarkably peaceful but managed to upend regimes anyway. Targeted as they were against

nominally revolutionary states—something, again, without much obvious precedent—these uprisings were associated as much with the discourse of reform as of revolution.

These uprisings also ended the Cold War, which had major implications for would-be revolutionary projects everywhere. By the start of the twenty-first century, scholars of revolution were seriously debating whether revolutions had a future. Beyond the academy, many on the political left assumed that, with a globalized capitalism now more dominant than ever, older ideas about revolution in the sense of taking power to transform a given nation-state were now redundant, and that the concept of revolution would have to be re-thought.

In the 2000s, certain events brought revolution back on the agenda. The color revolutions in postsocialist states such as Serbia, Ukraine, and Georgia led some scholars to compare them as “nonviolent” or “people power” revolutions, to the Iranian Revolution, the mid-1980s Filipino Yellow Revolution, and the events of 1989, and to suggest that they marked a new departure from many of the forms of previous revolutions. And in 2011, the events of the Arab Spring put the word “revolution” back in the zeitgeist even more dramatically.

However, it is at least questionable whether any of these purported twentieth-century revolutions meet the criteria of classic definitions of revolution, whatever their form. Some have achieved negotiated democratizing reforms rather than state overthrow, while some have depended on high levels of outside intervention and militarization to achieve state overthrow. Events in the Arab world continue to unfold, but it may be the case that rather than being explicable simply in terms of evolution in revolutionary forms, they reiterate the unresolved questions raised around the turn of the millennium about the future of revolutions in the twenty-first century as well as deeper questions about how to define and conceptualize revolutions.

Rights, Civil

A civil right is an enforceable right or privilege, which if interfered with by another gives rise to an action for injury. Examples of civil rights are freedom of speech, press, and assembly; the right to vote; freedom from involuntary servitude; and the right to equality in public places. Discrimination occurs when the civil rights of an individual are denied or interfered with because of their membership in a particular group or class.

—Cornell University Law School, Legal Information Institute
(<http://www.law.cornell.edu/wex/civilrights>)

In 1954, the U.S. Supreme Court's ruling in *Brown v. Board of Education* triggered the eventual integration of America's schools, and, particularly during the 1960s and 1970s, there was dramatic civil rights progress in the United States for groups of Americans who had experienced generations of discrimination, including unequal legal rights and unequal access to society's jobs, housing, and services. In a growing flood of mass movements, aggrieved groups marched for voting rights, for equal rights in schools, and for political empowerment. The efforts of African Americans, Hispanics, Indigenous peoples, women, disabled Americans, and gay, lesbian, bisexual, and transgender (GLBT) peoples led to advances in civil rights. Civil rights organizations in the United States—such as the Southern Christian Leadership Conference, founded by Dr. Martin Luther King Jr.—

were much in the public eye during this period. Other groups fighting discrimination also organized civil rights movements, and most achieved unprecedented progress in the social and legal recognition of their respective civil rights. The only group that did not achieve much progress was labor, which saw its rights slowly diminish in the decades after World War II.

Although many civil rights have not been fully won, the years since 1954 have been more oriented toward civil rights than any other period in American history, culminating in the 2008 election of an African American president of the United States. This entry traces the development of the post-1954 African American Civil Rights Movement, then describes the other civil rights movements that took place during this period, and finally offers some observations on the linkages between civil rights movements in American society.

The African American Civil Rights Movement

After President Abraham Lincoln's 1863 Emancipation Proclamation freed African American slaves in most Southern states, the next major challenge for freed slaves ("freedmen") was to gain full civil rights, including voting as well as equal treatment in employment, housing, accommodations, and education. Although freedmen gained these rights from 1865 to 1876 through the 13th, 14th, and 15th Amendments to the U.S. Constitution and five civil rights bills passed before 1875, the U.S. Congress began to retreat on civil rights for African Americans beginning in 1877.

In 1877, the Supreme Court invalidated the five civil rights laws. Thereafter few African Americans in the South could vote, and political power gradually returned to Whites in most Southern state and local political offices. The Supreme Court's 1896 ruling in *Plessy v. Ferguson* legitimized the segregation practices initiated in the South over the previous 20 years and provided an impetus for further segregation laws. African American rights won through legislation during the Reconstruction Era (1865-76) were erased by means of the "separate but equal" doctrine articulated in *Plessy*, which formalized segregation and legalized discrimination in the South. Southern states passed so-called separate but equal laws, later called

Jim Crow laws, that mandated segregation in education, housing, transportation, and services. Jim Crow laws also deprived African Americans in Southern states of most of their civil rights, including the right to vote and to serve on juries, and thus prevented them from enjoying equal treatment in the courts. They also could no longer redress their grievances through serving in local, state, or national government.

White Southern Democrats, called Dixiecrats, came to power in the South after 1876, and vehemently opposed the reestablishment of African American voting and other basic civil rights that might have given the large African American populations of many southern states local and regional political power. Instead, African Americans faced not only discrimination but acts of terror throughout the South. White citizens' groups, such as the Ku Klux Klan and White Citizens' Councils, carried out lynchings and other terrorist acts. Southern elected officials successfully blocked all state legislation against lynching, and no federal anti-lynching legislation was passed until it was criminalized under the Civil Rights Act of 1968.

The period between *Plessy v. Ferguson* in 1896 and *Brown v. Board of Education* in 1954 also saw Northern state government takeovers by the Ku Klux Klan, such as in Colorado and Indiana in the 1920s. Anti-Black race riots occurred in cities in both the South (including Atlanta, Georgia, in 1906, and Rosewood, Florida, in 1923) and the North (including those in Springfield, Illinois, in 1908; Chicago, Illinois, 1919; Tulsa, Oklahoma, 1921; and Detroit, Michigan, 1943).

World War II brought African Americans more into the mainstream with the creation of segregated military units such as the Tuskegee Airmen, who were given more responsibility as the war wore on although the armed forces remained segregated. By the end of the war, African American servicemen had shown their patriotism and valor, as they had done in World War I, and were asking for full and equal civil rights and for integration in residential, work, and other social contexts.

President Harry Truman integrated the U.S. Army just before the 1948 election, opening the door to equal treatment of African Americans in other areas of American life. Still, full legal equality, both in the political world and in civil society generally, was not yet possible. African Americans

could join only a handful of unions (such as the Brotherhood of Sleeping Car Porters), were kept from voting throughout the South, and were discriminated against in schools, jobs, housing, and services such as restaurants, theaters, and lodging. Although African Americans could vote in the North, they still had not achieved equal civil rights in almost all other areas, for both legal and de facto reasons.

Despite lack of legal protections in Southern courts and facing acts of terrorism by White racists in the South, African Americans began to form organizations against lynching and for civil rights beginning in the years following *Plessy v. Ferguson*. The best known are the National Association for the Advancement of Colored People (NAACP, 1909); the Urban League (1910); Pan-African Congresses, (organized by W. E. B. Du Bois, beginning in 1919); and religious organizations. The only African American union, the Brotherhood of Sleeping Car Porters, was founded by A. Philip Randolph in 1925.

In the wake of World War II, President Truman in 1948 took the courageous step of opposing the Dixiecrats, including Southern congressmen and U.S. senators, and calling for the integration of the armed forces. The Dixiecrats walked out of the 1948 Democratic nominating convention, but Truman won the Democratic nomination and an unexpected victory over Republican candidate Thomas Dewey with the help of African American voters in the North.

With the momentum building for civil rights for African Americans, the growth of a worldwide human rights agenda through the newly formed United Nations, and the 1948 passing of the Universal Declaration of Human Rights, the NAACP began careful preparation of a legal case to challenge the 55-year-old doctrine of “separate but equal” first legitimized by the Supreme Court in *Plessy v. Ferguson* (1896). A legal team led by Thurgood Marshall (who later became the first African American appointed to the Supreme Court) argued that separate was inherently unequal and amounted to discrimination and unequal treatment based solely on race. In 1954, the Supreme Court agreed in *Brown v. Board of Education*, and the U.S. then began school integration.

After 1954, although school integration had become the law of the land, the Southern states still resisted both school integration and integration of all other political, economic, and social facilities. Segregation in the South remained, supported by the Jim Crow laws. The question for African American leaders was how to move civil rights forward. The next 11 years saw civil rights movements on many fronts throughout the South and in parts of the North, with the members of the African American Civil Rights Movement providing leadership to spearhead desegregation efforts.

One of the first civil rights actions was aimed at making city buses in Montgomery, Alabama, available on equal terms to African Americans. In Montgomery, as in many other Southern cities, African Americans were a major part of the bus ridership but were treated unequally, being required by law to sit in the back of the buses and to give up their seats if asked by a White person. The Montgomery bus boycott of 1955–56 was one of the first civil rights campaigns to use Gandhian nonviolent resistance techniques to carry out a boycott. As the boycott commenced, a young Baptist minister, Dr. Martin Luther King Jr., was selected as the leader. He led the Montgomery boycott for over a year, and its success propelled him to national prominence. Nine years after Montgomery, his leadership helped bring about the historic 1964 Civil Rights Act and the 1965 Voting Rights Act. In 1964, Dr. King won the Nobel Peace Prize for his civil rights work. He then continued to carry out civil rights campaigns until his assassination in 1968 while organizing and demonstrating for sanitation workers in Memphis, Tennessee.

Other African American civil rights campaigns included the 1960 lunch-counter sit-ins organized by the Student Nonviolent Coordinating Committee (SNCC) and the 1961 Freedom Rides organized by the Congress of Racial Equality (CORE). There also were campaigns for African American voter registration such as the 1964 Freedom Summer.

Toward the end of his life, Dr. King began to challenge racism and discrimination in the North, such as in Chicago, and to point out the economic inequalities suffered by many African Americans in the South, such as sanitation workers in Memphis. He also began to speak out against

the Vietnam War. He participated in and helped to plan the March on Washington in 1963, where he made his historic “I Have a Dream” speech.

Other Civil Rights Movements

The African American Civil Rights Movement helped to stimulate other civil rights movements, including those working for women’s liberation; Indigenous peoples’ civil rights; Chicano civil rights; lesbian, gay, bisexual, and transgender rights; and the rights of people with disabilities. Direct action techniques from the Civil Rights Movement were also adopted by the anti-Vietnam War movement.

The women’s movement began with the Seneca Falls Declaration of 1848, calling for suffrage, and moved slowly forward until the ratification in 1920 of the 19th Amendment to the Constitution, giving women the vote throughout the United States. The second wave of the movement for women’s rights was kicked off in 1963 by the publication of Betty Friedan’s *The Feminine Mystique*. In 1966, the National Organization for Women (NOW) was formed, and its advocacy helped bring about the 1973 *Roe v. Wade* Supreme Court decision establishing a woman’s right to have an abortion. The Equal Rights Amendment (ERA) passed both houses of Congress in 1972 and was sent to the states for ratification, but it narrowly failed to win the necessary three-quarters of the states. Title IX of the Equal Education Opportunities Act of 1972 prohibited discrimination on the basis of sex in any federally funded educational activity or program. Under Title IX, participation by girls and women in sports programs increased dramatically. Title IX also increased the opportunities for women in all academic fields and disciplines and in leadership positions at universities, in the business world, and in governmental service. Title X of the 1970 Public Health Service Act provided funding for family planning. Current women’s rights issues include efforts to restart the ERA and to address the continuing disparity between men and women’s wages; in 2012, women received about 79 cents for every \$1 received by men.

Because women now constitute a majority of U.S. voters, they have become a major political force and may well develop a third-generation women’s civil-rights movement.

American Indigenous peoples have carried out a long and difficult struggle to gain recognition of their rights to human dignity, political equality, and sovereignty. Native Americans were not made citizens until 1924, and, as late as the 1930s, they were often forced to send their children to government-run boarding schools, the children were punished for using their native languages, and they were often abused by administrators. A major Native American civil rights group is the American Indian Movement (AIM), founded in 1968 in Minneapolis, Minnesota, by Dennis Banks and other urban Native Americans. Russell Means, an Oglala Lakota, was a leader in 1970s protests led by AIM. The organization addressed a number of issues facing Indigenous peoples, including poverty, housing, treaty enforcement, and police harassment. In October 1971, AIM members from across the country went to Washington, DC, for a protest known as the "Trail of Broken Treaties." AIM gained national recognition when it occupied the Bureau of Indian Affairs national headquarters and presented its demands to the federal government. In 1973, AIM led an armed standoff with federal forces at Wounded Knee, South Dakota, on the Pine Ridge Indian Reservation. AIM continues to advocate for Indigenous people's civil rights and sovereignty. One such activity has been the anti-Columbus Day campaigns in Denver, Colorado, led by Dr. Glenn Morris and others.

The first gay rights organization was started by a small group of gay men who created the Mattachine Society in 1951. The Stonewall Riots of 1969 in New York City are often regarded as the start of the gay rights movement. When the New York Police raided a gay bar in Greenwich Village and started arresting employees and drag performers, a crowd of some 2,000 gay, lesbian, bisexual, and transgender supporters challenged the police. A year later, GLBT activists in major cities, including New York, held a parade to commemorate the confrontation. Gay Pride parades have been held in June ever since. The GLBT community has continued to struggle for many civil rights, including equal employment, non-discrimination, and same-sex marriages. On June 26, 2013, the U.S. Supreme Court struck down the federal Defense of Marriage Act, ruling that married same-sex couples were entitled to federal benefits. The Court also declined to hear a case in which proponents of California's Proposition 8 had sought to overturn a trial court's ruling against the initiative. However, the Court did not hold that same-sex couples have a constitutional

right to marry; thus, the decision whether to allow same-sex marriage remains with the states, and the issue continues to be a focus of the LGBT movement.

Hispanic civil rights advocates organized movements for two types of groups. First there were Hispanic, mostly Mexican, field workers, who formed the United Farm Workers in 1962 under the leadership of César Chávez and Dolores Huerta. After a very long strike against lettuce growers, grape growers, and wine companies such as Gallo, the United Farm Workers finally won a major victory in 1970, gaining better wages, working conditions, and benefits for California farm workers. Hispanics also organized Chicano consciousness-raising groups in many cities, particularly in the southwestern United States. In Denver, Colorado, the Crusade for Justice was formed and led by Rodolfo “Corky” Gonzales. The Crusade marched and worked for equal rights for Hispanics in Denver. There were similar Hispanic civil rights campaigns in other parts of the western United States.

Recognition of civil rights for the disabled was gained as a result of a movement to grant civil rights for disabled Americans. Their efforts succeeded with the passage of the Americans with Disabilities Act of 1990, which extended the civil rights that had been accorded to the other groups mentioned above in the 1964 Civil Rights Act. In an important sense, this recent civil rights movement is the most comprehensive, because unlike the case with race or gender, anyone can become disabled.

As Paul Gordon Lauren has argued, major events such as wars have often triggered advances in human rights, including civil rights. World War II and then the anti-Vietnam War movement seemed to have had that consequence in the United States. There also is often cross-pollination between various civil rights movements. In the 19th century, abolitionist leaders included women who went on to start the woman’s suffrage movement. In the case of the civil rights movements, Dr. King spoke out against the Vietnam War, and many activists from other civil rights movements participated in the African American civil rights movement.

Civil Rights Movements and Political Thought

Civil rights movement theorists, such as Aldon Morris, have also argued that the tremendous successes of the African American civil rights movement, particularly between 1955 and 1965, have led political theorists to rethink how successful political movements develop. Morris has argued that mass-based political movements can arise due to many factors: the successful mobilization of mass groups, giving them agency that they theretofore had never known they had; the power and success of Dr. King's application of nonviolent direct-action techniques as well as his charismatic leadership; the newly important role of mass media, particularly television, in shaping U.S. public opinion; the emerging power of international public opinion, particularly in Africa, during the U.S.-Soviet Cold War; and, finally, the growing financial, political, and voting power of African Americans in the northern United States, millions of whom had migrated north before and during World War II.

Morris also argues that later civil rights movements learned from the techniques of mass mobilization and nonviolent direct action used in the African American Civil Rights Movement, and during the 10 years after 1965, were remarkably successful in achieving their goals by applying these methods. He sees the African American civil rights movement from 1954 to 1965 as a model and an inspiration to movements addressing gender, race/ethnicity, sexuality, and the rights of persons with disabilities. Forms of nonviolent direct action, such as sit-ins, Freedom Rides, marches, and various demonstrations, were modeled on those of Mahatma Gandhi and applied Gandhian techniques to African American civil rights movements of the late 1950s and early 1960s. Without the techniques developed during these movements and the inspiration of their successes, it is hard to imagine the successes that the many other civil rights movements subsequently achieved after 1965.

The era of mass civil rights activism is over for now, but it has led to major improvements in the civil rights of African Americans, Indigenous peoples, women, Hispanics, the disabled, and the GLBT community. Although progress often entailed significant human costs, and some progress has been lost, the current high levels of civil rights for these historically oppressed populations would have seemed inconceivable 50 years ago.

Rights, Natural and Human

Talk of human rights is widespread. For some commentators, the post–Cold War world is, or should be, characterized by the predominance of human rights as the key criterion for determining the legal, political, and moral legitimacy of those who hold and wield power. Although the term may be familiar to many, the precise meaning of the concept of human rights is often assumed rather than clearly spelled out. Often references to rights will imply or directly draw on the International Bill of Human Rights, which comprises the Universal Declaration of Human Rights, the International Covenant on Civil and Political Rights, and the International Covenant on Economic, Social, and Cultural Rights. Taken together, these three documents provide the basis for a comprehensive and elaborate framework of rights that cover and seek to regulate fundamental aspects of human life. However, such statements of human rights do not serve to define the concept but merely identify and enumerate what may be thought of as legitimately belonging to the category of human rights in the first place.

An ever expanding academic literature of human rights contains numerous definitions from the simple and logical references to human rights being what humans are due as humans to less simple but more substantively comprehensive formulations. The philosopher James Nickel provides a particularly clear and comprehensive definition of human rights when he states that human rights are:

basic moral guarantees that people in all countries and cultures allegedly have simply because they are people. Calling these guarantees “rights” suggests that they attach to particular individuals who can invoke them, that they are of high priority, and that compliance with them is mandatory rather than discretionary. Human rights are frequently held to be universal in the sense that all people have and should enjoy them, and to be independent in the sense that they exist and are available as standards of justification and criticism whether or not they are recognized and implemented by the legal system or officials of a country. (Nickel 1987, 561–62)

Human rights aim to identify both the necessary negative and positive prerequisites for leading a minimally good life, such as rights against torture and rights to health care and access to clean drinking water. To possess a human right is to possess an entitlement to enjoy access to certain fundamental goods and to be free from forms of external impediments or interference that compromise one’s potential to secure the conditions for a minimally good life. Definitions of concepts typically serve to orient us toward achieving a better understanding of something but cannot, by themselves, provide a sufficiently detailed account of the concept in question, particularly in the case of human rights. Securing a detailed understanding of this ubiquitous but amorphous term requires an analysis of the historical development of human rights and a discussion of key contemporary debates concerning the basis and scope of the legitimate application of human rights within a complex world.

Historical Development

The doctrine of human rights rests on a fundamental philosophical claim: that there exists a rationally identifiable moral order, an order whose legitimacy precedes contingent social and historical conditions and applies to all human beings everywhere and at all times. With this view, moral beliefs and concepts are capable of being objectively validated as fundamentally and universally true. The contemporary doctrine of human rights is one of a number of universalist moral perspectives. The history of the philosophical development of human rights is punctuated by a number

of specific moral doctrines that, although not themselves full and adequate expressions of human rights, have nevertheless provided a number of philosophical prerequisites for the contemporary doctrine. These include a view of morality and justice as emanating from some presocial domain, the identification of which provides the basis for distinguishing between “true” and merely “conventional” moral principles and beliefs. The essential prerequisites for a defense of human rights also include a conception of the individual as the bearer of certain “natural” rights and a particular view of the inherent and equal moral worth of each rational individual. Each needs to be discussed in turn.

Moral universalism posits the existence of rationally identifiable, transcultural and transhistorical moral truths. The origins of moral universalism within Europe are typically associated with the writings of Aristotle and the Stoics. Thus, in his *Nicomachean Ethics*, Aristotle unambiguously expounds an argument in support of the existence of a natural moral order. This natural order should provide the basis for all truly rational systems of justice. An appeal to the natural order provides a set of comprehensive and potentially universal criteria for evaluating the legitimacy of actual “human-made” legal systems. In distinguishing between “natural justice” and “legal justice,” Aristotle writes, “the natural is that which has the same validity everywhere and does not depend upon acceptance” (*Nicomachean Ethics*, 189). Thus, the criteria for determining a truly rational system of justice preexist social and historical conventions. Natural justice preexists specific social and political configurations. The means for determining the form and content of natural justice is the exercise of reason free from the distorting effects of mere prejudice or desire. This idea was similarly expressed by the Roman Stoics, such as Cicero and Seneca, who argued that morality originated in the rational will of God and the existence of a cosmic city from which one could discern a natural, moral law whose authority transcended all local legal codes. The Stoics argued that this ethically universal code imposed on all of us a duty to obey the will of God. The Stoics thereby posited the existence of a universal moral community secured through our shared relationship with God. The belief in the existence of a universal moral community was maintained in Europe by Christianity over the ensuing centuries. Although some have discerned intimations toward the notion of rights in the writings of

Aristotle, the Stoics, and Christian theologians, a concept of rights approximating that of the contemporary idea of human rights most clearly emerges during the seventeenth and eighteenth centuries in Europe and the so-called doctrine of natural law.

The basis of the doctrine of natural law is the belief in the existence of a natural moral code based on the identification of certain fundamental and objectively verifiable human goods. Our enjoyment of these basic goods is to be secured by our possession of equally fundamental and objectively verifiable natural rights. Natural law was deemed to preexist actual social and political systems. Natural rights were thereby similarly presented as rights individuals possessed independently of society or polity. Natural rights were presented as ultimately valid irrespective of whether they had achieved the recognition of any given political ruler or assembly. The quintessential exponent of this position was the seventeenth-century philosopher John Locke and, in particular, the argument he outlined in his *Two Treatises of Government* (1688). At the center of Locke's argument is the claim that individuals possess natural rights, independently of the political recognition granted them by the state. These natural rights are possessed independently of, and prior to, the formation of any political community. Locke argued that natural rights flowed from natural law. Natural law originated from God. Accurately discerning the will of God provided us with an ultimately authoritative moral code. At root, each of us owes a duty of self-preservation to God. To discharge this duty of self-preservation successfully, each individual had to be free from threats to life and liberty, while requiring what Locke presented as the basic, positive means for self-preservation: personal property. Our duty of self-preservation to God entailed the necessary existence of basic natural rights to life, liberty, and property. Locke proceeded to argue that the principal purpose of the investiture of political authority in a sovereign state was the provision and protection of individuals' basic natural rights. For Locke, the protection and promotion of individuals' natural rights were the sole justification for the creation of government. The natural rights to life, liberty, and property set clear limits to the authority and jurisdiction of the state. States were presented as existing to serve the interests, the natural rights, of the people, and not of a monarch or a ruling cadre. Locke went so far as to argue that individuals are morally justified in taking up arms

against their government should it systematically and deliberately fail in its duty to secure individuals' possession of natural rights.

Analyses of the historical predecessors of the contemporary theory of human rights typically accord a high degree of importance to Locke's contribution. Locke provided the precedent of establishing legitimate political authority upon a rights foundation. This stance is an undeniably essential component of human rights. However, the philosophically adequate completion or theoretical basis of human rights requires an account of moral reasoning that is consistent with the concept of rights but that does not necessarily require an appeal to the authority of some super-human entity in justifying human beings' claims to certain fundamental rights. Such an account may be found in the work of the eighteenth-century German philosopher Immanuel Kant.

Many of the central themes first expressed within Kant's moral philosophy remain highly prominent in contemporary philosophical justifications of human rights. Foremost among these are the ideals of equality and the moral autonomy of rational human beings. Kant bestows on contemporary human-rights theory the ideal of a potentially universal community of rational individuals autonomously determining the moral principles for securing the conditions for equality and autonomy. Kant provides a means of justifying human rights as the basis for self-determination grounded within the authority of human reason. Kant's moral philosophy is based on an appeal to the formal principles of ethics rather than, for example, an appeal to a concept of substantive human goods. For Kant, the determination of any such goods can proceed only from a correct determination of the formal properties of human reason and thus do not provide the ultimate means for determining the correct ends, or object, of human reason. Kant's moral philosophy begins with an attempt to identify correctly those principles of reasoning that can be applied equally to all rational persons, irrespective of their own specific desires or partial interests. In this way, Kant attaches a condition of universality to the correct identification of moral principles. For him, moral reasoning must rest on a condition to which all rational individuals are bound to assent. Doing the right thing is thus not determined by acting in pursuit of one's own interests or desires but by acting in accordance with a maxim that all rational

individuals are bound to accept. Kant terms this the categorical imperative, which he formulates in the following terms, “act only on that maxim through which you can at the same time will that it should become a universal law” (1948, 84). Kant argues that this basic condition of universality in determining the moral principles for governing human relations is a necessary expression of the moral autonomy and fundamental equality of all rational individuals. The categorical imperative is self-imposed by morally autonomous and formally equal rational persons. It provides the basis for determining the scope and form of those laws that morally autonomous and equally rational individuals will institute to secure these same conditions. For Kant, the capacity for the exercise of reason is the distinguishing characteristic of humanity and the basis for justifying human dignity. As the distinguishing characteristic of humanity, formulating the principles of the exercise of reason must necessarily satisfy a test of universality; they must be capable of being universally recognized by all equally rational agents. Kant’s moral philosophy is notoriously abstract and resists easy comprehension. Although often overlooked in accounts of the historical development of human rights, his contribution to human rights has been profound. Kant provides a formulation of fundamental moral principles that, although exceedingly formal and abstract, are based on the twin ideals of equality and moral autonomy. Human rights are rights we give to ourselves, so to speak, as autonomous and formally equal beings. For Kant, any such rights originate in the formal properties of human reason, and not the will of some super-human being.

The philosophical ideas defended by the likes of Locke and Kant have come to be associated with the general Enlightenment of the seventeenth and eighteenth centuries, the effects of which were to extend across the globe and over ensuing centuries. Ideals such as natural rights, moral autonomy, human dignity, and equality provided a normative bedrock for attempts to reconstitute political systems, for overthrowing formerly despotic regimes and seeking to replace them with forms of political authority capable of protecting and promoting these new emancipatory ideals. These ideals effected significant, even revolutionary, political upheavals throughout the eighteenth century, enshrined in such documents as the U.S.’s Declaration of Independence and the French National Assembly’s Declaration of the Rights of Man and Citizen. Similarly, the

concept of individual rights continued to resound throughout the nineteenth century, as exemplified by Mary Wollstonecraft's *Vindication of the Rights of Women* and other political movements to extend political suffrage to sections of society that had been denied political and civil rights. The concept of rights had become a vehicle for effecting political change. This historical process eventually came to fruition in the establishment of an international human rights regime, enshrined by the International Bill of Human Rights, and the widespread appeal to human rights by oppressed and subjugated peoples across the world today.

The modern doctrine of human rights is deeply indebted to the earlier concept of natural rights and the doctrine of natural law. However, Nickel (1987, 8–10) identifies three specific ways in which the contemporary concept of human rights differs from, and goes beyond, its predecessor of natural rights. First, contemporary human rights are argued to require positive action by the state, via the provision of welfare assistance, for example. Advocates of natural rights, he argues, were far more inclined to view equality in formalistic terms, as principally requiring the state to refrain from interfering in individuals' lives. Second, whereas advocates of natural rights tended to conceive of human beings as mere individuals, veritable "islands unto themselves," advocates of contemporary human rights are far more willing to recognize the importance of family and community in individuals' lives. Third, Nickel views contemporary human rights as being far more internationalist in scope and orientation than was typically found within arguments in support of natural rights. The protection and promotion of human rights are now increasingly seen as requiring international action and concern.

The distinction drawn by Nickel between contemporary human rights and traditional natural rights allows one to discern the development of the concept of human rights. Indeed, many writers on human rights agree in the identification of three generations of human rights. First-generation rights consist primarily of rights to security, property, and political participation. These are most typically associated with the French and U.S. declarations. Second-generation rights are construed as socioeconomic rights, rights to welfare, education, and leisure, for example. These rights largely originate within the Universal Declaration of Human Rights. The final and third

generation is associated with such rights as a right to national self-determination, the right to a clean environment, and the rights of indigenous minorities. This generation of rights only recently took hold during the last two decades of the twentieth century but represents a significant development within the doctrine of human rights generally.

Contemporary Relevance and Ongoing Debates

Talk of human rights has thus become widespread. In part, this development reflects the continuing influence and appeal of the doctrine. However, it also testifies to the continuing abuse and violation of human rights across the world today: Although human rights apply to all human beings, not all human beings respect human rights. The systematic and continuing violation of human rights has many complex causes, which are beyond the scope of this article. The concept of human rights and the assumptions it rests on have been subject to academic criticism. Human-rights skepticism is not the exclusive preserve of despotic leaders and elites who may perceive themselves as having little to gain and everything to lose from protecting and promoting human rights. Within the academic sphere there is one recurring area of critical debate: the question of universal validity of human rights and a correlative concern that human rights may sometimes take on a culturally imperialist complexion.

Moral universalism is central to human rights. As moral principles and as a moral doctrine, human rights are considered by proponents to be universally valid. However, moral universalism has long been subject to criticism by moral relativists, who argue that universally valid moral truths simply do not exist. Relativists view morality as a social and historical—indeed even a personal—phenomenon. Moral beliefs and principles are therefore thought of as conditionally contingent, valid only for those cultures and societies in which they originate and within which they are widely approved. In the extreme form, moral relativism means that right and wrong are whatever each of us says they are. Relativists point to the vast array of diverse moral beliefs and practices apparent in the world today as empirical support for their position. Even within a single society, such as the United States or Great Britain today, there exists a wide diversity of fundamental moral beliefs, principles, and practices. Contemporary, complex societies are thus

increasingly considered to be pluralist and multicultural in character. For many philosophers, the multicultural character of such societies serves to restrict the substance and scope of the regulative political principles governing them. In respect of human rights, relativists have tended to focus on such issues as the presumed individualist character of the doctrine of human rights. It has been argued by numerous relativists that human rights are unduly biased toward morally individualist societies and cultures, at the necessary expense of the communal moral complexion of many Asian and African societies. Allegedly universal human rights can thus become the basis for imposing and perpetuating a form of cultural and moral imperialism.

The philosophical debate between universalists and relativists is far too complex to exhaust here. However, certain immediate responses to the relativist critique of human rights are available. First, merely pointing to moral diversity and the presumed integrity of individual cultures and societies does not, by itself, provide a philosophical justification for relativism, nor a sufficient critique of universalism. After all, there have existed and continue to exist many cultures and societies whose treatment of their own people leaves much to be desired. Is the relativist genuinely asking us to recognize and respect the integrity of Nazi Germany, or any other demonstrably repressive regime? There can be little doubt that, as it stands, relativism is incompatible with human rights and arguably with an innate human desire not to be abused. Would relativists willingly forgo their own rights if society demanded it? Relativist arguments are typically presented by members of the political elites within those countries whose systematic oppression of their peoples has attracted the attention of advocates of human rights. The exponential growth of grassroots human-rights organizations across many countries whose cultures are alleged to be incompatible with the implementation of human rights raises serious questions of the validity and integrity of such indigenous relativists. Although oppressive rulers argue relativity to the world, they hardly do so to their own peoples, who are reprehended and punished for violating the rulers' own concepts of right and wrong.

Nonetheless, specific ethnic groups' and communities' concerns over the incompatibility between global human rights and their own communal

moral systems have a degree of plausibility. Claims of the universality of a right are at least contestable, and the leaders of some countries have clearly used their own favored concepts to oppress other countries or groups, including indigenous peoples whose cultures are regarded as “barbaric” by settler societies. Moreover, the Western origin of the concept of human rights has given it its individualistic rather than communal basis and bias. By contrast, the so-called third generation of human rights is far more attuned to the communal and collective basis of many individuals’ lives. In keeping with the work of political philosophers such as Will Kymlicka, human-rights principles have come to be tailored increasingly to such things as the collective rights of minorities and to these minorities’ claims to communal rights such as land, language, and culture. Although human rights remain philosophically grounded mostly within an individualist moral doctrine, attempts are increasing to extend them to a more communal perspective.

The relativist critique of human rights can thus help protect against the perpetration of cultural intolerance in the name of advancing international human rights. All of the societies of the world do not comply, nor need they comply, with a single substantive moral outlook. To the degree that the world fails to reach consensus on certain arguably universal norms, there can be room for respecting cross-cultural differences in fundamental practices, traditions, and beliefs. In areas of controversy, respectful dialogue offers an alternative to simple condemnation of alternative viewpoints. In recent decades, many advocates of human rights have become more culturally sensitive and more readily espouse a form of moral pluralism within the parameters of human rights. This process has also greatly benefited from many of those directly affected by human rights abuses taking a more active role in combating these abuses while remaining true to their own cultural ways of being, which may well differ from those found within European and North American societies. The essence of human rights militates against their being claimed by any single society or civilization.

Human rights belong to us all. Despite the importance of respecting cultural diversity, in some cases, a commitment to respecting human rights requires drawing a moral line in the sand. Some practices are intolerable regardless

of how much support they may enjoy within a given society. Identifying where this line is to be drawn entails a commitment to the ideals of liberty, equality, and a fundamental respect for human dignity. The precise meaning and legitimate application of these ideals are continuing areas of intellectual and moral debate. Given the extent to which countless millions of peoples' human rights are systematically violated, it is vitally important that such debate not obscure recognition of some moral certainties, for instance, the prevention of torture and of violence against the innocent. Ultimately, an insistence on securing the conditions for each human being to lead a minimally good life, free from the threat of systematic and significant suffering, seems an appropriate and reasonable certainty for an otherwise complex and uncertain world.

Romanticism

The origins and nature of the movement known as romanticism have been much discussed, although with little fundamental consensus as to how they should be defined. The chief difficulty here is the great diversity of the movement, whose principal centers at the peak of its influence, c. 1800–50, were Germany and Britain, with notable developments elsewhere in later periods. Reacting to scientism, rationalism, the commercial and Industrial revolutions, and then also in part the French Revolution, the romantics were active in literature, poetry, painting, and music. Some of their concerns, such as a fascination with horror, awe, and the sublime; the gothic and macabre; and the peculiarity and intensity of feeling that accompanied these perceptions, had relatively little political purchase. In other areas, notably a focus on reconstructing the past, on the role played by heroic individuals in history, on the dangers of mob rule and its subsequent suppression of individuality, and on the primacy of feelings in understanding the sense of self, of location, and of obedience and loyalty, political implications abounded. Some of these tended to be reactionary, others radical, or both at the same time; nationalism often shared both attributes. Despite their differences, some common intellectual themes shared by them that have important political bearings included a fascination with the past and alarm respecting the future; a focus on nature, particularly as contrasted with the city, as a source of awe, inspiration, and evidence of God's presence; an aesthetic concern with individual and especially artistic creativity, originality, and genius as an expression of human uniqueness; and a

philosophical focus on intuitive, emotional, or religious insights by contrast with those gained from mere reason. Politically, the romantics contributed chiefly to ideas of nationalism, individualism, and religious and political reform through the first half of the nineteenth century. In Britain, romantics reacted chiefly to industrialization; in Germany, it was the chaos attendant on the Napoleonic wars, and the connections between the French Revolution and the Enlightenment, which were of greater concern, and led to romanticism being more closely connected with nationalism. While all reacted adversely to some of the more prominent aspects of modernity, the romantics thus did not share an identical political agenda, and there is no such thing as “political romanticism” as such in the singular.

In Britain, the cultivation of sensibility and praise for more natural as opposed to conventional morés formed part of the late eighteenth-century origins of romanticism and was often linked to the writings of Jean-Jacques Rousseau, whose *Discourse on the Origins of Inequality* (1755) and other works expressed much disdain for the falsehood and artificiality of civilized societies. Describing the ideal state of human society as one in which social inequality, private property, luxury, and refinement were not too far advanced, Rousseau trumpeted the virtues of small-scale agrarian republics where direct democracy encouraged civic virtue and inequality was restrained. His writings were often later associated with the ideal of the “noble savage” or presumed greater virtue of primitive peoples. Other writers, however, began nostalgically to lament the loss of their own pre-industrial societies of firmer social boundaries, and more resolute senses of propriety, rectitude, and duty, and the religiosity often assumed to bind these together. This would serve as one of the bases for the origins of modern conservatism.

After the French Revolution, a variety of appeals to ideal and sometimes semi-mythical pasts emerged, often republican in inspiration, and often combined with radical and even revolutionary sentiments. Edmund Burke’s *Reflections on the Revolution in France* (1790) is often taken to be the starting point for conservative defenses of monarchy, aristocracy, the clergy, and a more “organic” approach to both society and the pace of political change. This political stance, and the course of the revolution itself, led some, like William Wordsworth, to commence the period as radicals and

then to become deeply conservative. Others, like Samuel Taylor Coleridge, sought to shore up the moral authority of the decaying priesthood as an institution of social stability. Still others, like William Godwin, the most prominent Rousseauist in Britain at the time of the revolution, took the path of extreme individualism as a means of defeating the malevolent tendencies of organized social institutions. And a few, like William Cobbett, took the path in the opposite direction from Toryism to radicalism, lambasting the wreckage left by industrialization and the “deserted village” bereft of stout yeomanry of Oliver Goldsmith’s 1770 eponymous poem, and promoted opposition to the new monied Whigs, political economists, and Malthusians, as well as a sentimental conservatism of the spirit. By the 1830s, a few, like Thomas Carlyle, also turned to authoritarian socialism as a means of countering the disruption caused by the relentless progress of commercial and industrial society and urged in *Past and Present* (1843) the recapturing of the ordered universe of medieval society now led by captains of industry as a response to economic distress. Carlyle’s philo-medievalism and proto-socialism was revived by one of the great art and architectural critics of the age, John Ruskin, whose *Unto This Last* (1860) sought a renewal of the bonds of medieval loyalty from below and duty from above through a socialistic system of economic exchange. This, in turn, shorn of its authoritarian elements, helped to inspire the socialism of William Morris, although this had Icelandic and other sources as well. Even more than Ruskin, too, Morris imagined that the future socialist society would permit the free development of creative activity on the part of all workers, rendering art and the production of articles of beauty for everyday life an integral part of human existence. And John Stuart Mill would adopt some leading romantic themes to liberal philosophy, trumpeting against the evident mediocrity and “tyranny of the majority” of modern commercial democracies the virtues of individuality, creativity, and “character” in *On Liberty* (1859).

In Germany, the more political strands of romanticism stemmed in part from the “cult of genius” of the *Sturm und Drang*. This German literary movement associated itself with the texts of Johann Wolfgang von Goethe and Friedrich Schiller. The French occupation of Germany, and particularly the diffusion of French neoclassicism, provoked the movement’s rejection of foreign rationalist culture. The French Revolution and Napoleon’s

reorganization of Germany equally spurred philosophic discourses on the intrinsic value of nationhood. Johann Gottfried von Herder assembled a philosophy of cultural nationalism. He was less engaged in politics, science, and rationalism than in religion, custom, and feeling in the Pietist tradition. Johann Gottlieb Fichte promoted a contentious appreciation of Kantian philosophy that underpinned autocracy of the ego and imagination. He developed exclusionary ideas regarding the identity of “nation” as the highest common interest. Language served as the primary bond and boundary of the nation-state, followed by education, culture, geography, and race.

Although early German romantics generally bolstered monarchic rule, they perceived its practices as corrupt and tyrannical. Novalis recommended participatory government be joined to republican monarchy. Fichte concluded that citizenship germinated only from full allegiance to the state, which supplied its power. Schiller thought the monarch could lead by the example of civic virtue. Coupled with a republican aesthetic program, this mode of governance would stabilize insurrectionary predilections and help to realize an ideal nation.

Religion embodied the German romantics’ critical reaction to the French Revolution. Observing the results of the Terror, Herder affirmed that France remained unprepared for republican life. Moral instruction was critical to any true, operative republican society. Adam Müller strove to spiritualize economics, politics, monarchy, and international relations. His revisionist texts entailed Christ dying for both the nation-state and the individual. Friedrich Schleiermacher declared that patriotic communities empowered the national genius. The vernaculars of race, religion, soil, and culture in a folk expression built from the patriarchal family would produce “greater Germany.” The social structure they envisioned was analogous to medieval feudalism.

Although antiromantic and received as un-Christian, Georg Wilhelm Friedrich Hegel’s philosophy of relativism conveyed not Kantian universal “reason” but the notion that rational thought differed according to time and space. F. W. J. Schelling sought to eradicate Hegelianism and communist ideas diffusing in German universities. Friedrich Engels was his

discontented student in the early 1840s. The degree to which he and Marx can be described as “romantics” is however contentious. Marx’s 1844 “Paris Manuscripts” described an unalienated state of human existence as the goal of the communist movement and saw this, following Ludwig Feuerbach, as a return of objectified powers and capacities to the individual as creator/laborer. This ideal drew on a concept of creativity and of free labor that was indebted to Charles Fourier in particular and also assumed that an essentially sociable human essence existed that was being degraded by capitalism. Both Marx and Engels can certainly be accused of having “romanticized” both the idea of the revolution and its agent, the proletariat, who are at least tacitly at times imbued with an essentialist goodness, and also the supposedly cleansing and liberating effects of violence itself, themes later taken up by Jean-Paul Sartre and Frantz Fanon, among others. But Marx and Engels were not antimodernist and did not trumpet the virtues of nature or associating with it as such. Indeed their aim was, like Robert Owen’s and Charles Fourier’s, to reconcile the contradictions between town and country. The more Fourierist aspects of their vision, particularly occupational flexibility, reflected some sense of the advantages of precapitalist agrarian life. But these aspects were also given little attention in the writings of either men after 1845 and are central neither to the goals of the *Communist Manifesto* (1848) nor their later chief works. Indeed the turning from “utopian” toward “scientific” socialism was in some respects precisely an antiromantic movement on the part of both.

In France, the more conservative romantics generally lamented secularization as well as many other aspects of modernity. François-René de Chateaubriand’s work romanticized the culture of Christianity. Its decadent pageantry, bells, symbolic formalism, and Gregorian chants, he thought, made religion indivisible from public life. Chateaubriand rejected the Enlightenment *philosophes* and their abstract ideas. Louis de Bonald’s contribution was his political engagement to annul legal divorce to ensure that the family remained the basic unit of society. Maistre commanded the militant restoration of the absolute, righteous, and ancient triumvir of classicism, the monarchy, and Catholicism. This resurrected power, he anticipated, would obliterate temporal democracy and Protestantism—the purported causes of the revolution.

Revolutionary thought also inspired new narratives of modernity in which the dislocation and alienation attendant on the destruction of the *ancien regime* could be supplanted in turn by a newly fortified system of moral relations. In France, Henri de Saint-Simon constructed a new scientific morality to guide social reorganization. In collaboration with Saint-Simon, Augustin Thierry proposed a European Parliament, chaired by a Newtonian scientific elite, to reconcile international and civic conflicts. The Saint-Simonians carried forward the outcome of their leader's thought "New Christianity." They intended to reconcile reason, imagination, and love via universal association, only to offend public morals by establishing a communistic community in Ménilmontant, a neighborhood in the twentieth arrondissement of Paris. Various French historians also attempted to come to terms with the Romantic critique of the revolution and to ascertain how individualism, community, and nation might be adequately reconciled with modernity. Like Saint-Simon, François Guizot viewed liberalism as the product of modernity. Protestantism and middle-class institutions paved the path to an orderly but progressive society. He favored centralized representative government and a constitutional monarchy to protect individual rights and legal equality for the general interest. Jules Michelet worked to establish historical research as an academic discipline. Its purpose, he maintained, was to delineate national identity and reconcile liberty and community. These writers agreed that revolution, whether successful or not, led society toward less division and inequality and toward a more fulfilling collective life. In the United States, less concerned initially with the pressing concerns of public order and poverty, reaction to early industrialization provoked in some instances a more individualist romantic politics, with Henry David Thoreau's *Walden; or, Life in the Woods* (1854), inspired by New England transcendentalism, becoming a prototypical novel of introspection and plea for the harmony of the individual with nature.

Romanticism can thus broadly be understood as the European zeitgeist that followed the Enlightenment and reacted to the French Revolution in particular. As an aspect of a wider critique of modernity, it represented a lament for the loss of religious faith, for the settled order and duties of preindustrial society, and for the trampling of the masses on the ideals of their notional intellectual superiors. It influenced the conceptual development of Western nation-states via heroic imaginings of natural

territorial settings, historic narratives of community, a cult of individuality wedded to ideas of genius and creativity, and visions of a new world more moral than the present evident wanton hedonism of the new capitalist order. National identity further reflected and reinforced numerous imperial conflicts among France, Germany, England, and America. In addition to war, the increasing democratization of Western society and religious and cultural differences contributed to different trajectories in industrial, economic, social, and political development. Moments of romantic rebellion against bourgeois conformity occurred from the late nineteenth century through the 1960s. This rebellion was sometimes personal, conceived as a lifestyle, but often assumed at least temporarily collective forms, as in intentional communities, often on the land, practicing ideals at variance with mainstream life, and especially the predominance of technology. In the twentieth century, various forms of anarchism, communism, socialism, nationalism, and fascism can thus be linked with romantic aspirations and ideals, often in proportion to their propensity to engage in a critique of modernity generally.

Rousseau, Jean-Jacques

Jean-Jacques Rousseau is a pivotal thinker in the history of political thought. First, Rousseau's thought in general marks a turning point as he was the first great critic of early modern philosophy whose own thinking constituted a radicalized version of early modern thought that influenced later romantic, historical, socialist, and other schools of thought. Second, Rousseau is a seminal democratic theorist, being the first major thinker to argue that democracy is the only legitimate form of government.

Life

The life and thought of Rousseau (1712–78) are intertwined to an unusual degree for a political thinker. In addition to writing autobiographical works that he saw as part of his thought, Rousseau himself suggested that his unusual life enabled him to grasp the variety of human nature and see through the conventions of his time.

Rousseau was born in Geneva to a mother who died giving birth to him and to a watchmaker father who would soon abandon him. His early education was sporadic and largely informal, the result of his early love of reading romantic novels and ancient history, reading that activated his imagination and made him dissatisfied with the more mundane world he actually inhabited. Apprenticed to an engraver, Rousseau first learned the ills of personal dependence. At age 16, he ran away from his native city and began

a life of wandering and exile that lasted for the rest of his days. Roaming through the alpine region of eastern France and northern Italy, Rousseau earned his bread as a lackey, seminarian, interpreter for a fake churchman soliciting contributions for the Holy Land, music teacher, and tutor. For over a decade, the young man lived with Françoise-Louise de Warens, a woman some 13 years his senior whom he affectionately called “Maman” and whose lover he soon became. She encouraged Rousseau’s intellectual and artistic interests. He read widely in literature, history, philosophy, and science, and, with little formal training in music, presented himself as a music teacher. As his relationship with “Maman” cooled and his ambition warmed, Rousseau left for Paris around the beginning of 1742 with two operas and a new system of musical notation in hand, determined to conquer the intellectual capital of Europe.

After his system of musical notation failed to win the sponsorship of the Academy of Sciences, Rousseau found himself just one among the many ambitious young men who flocked to Paris. Rousseau was briefly employed as secretary to the French ambassador to Venice from 1743 to 1744, leaving after he quarreled with his superior. Although his stay in the serene republic was brief, it stirred his first serious thoughts on politics. Returning to Paris, he went to work on an opera but once again failed to gain recognition. He became close friends during this period with Denis Diderot, along with Jean le Rond d’Alembert, Étienne Bonnot de Condillac, and other philosophes just beginning to achieve success and notoriety. During this same period, he began his relationship with Thérèse Levasseur, who became his lifelong mistress. Diderot invited Rousseau to write the articles on musical theory for the *Encyclopédie*, the great Enlightenment project he was beginning. By the time Rousseau’s collaboration was announced in the “Preliminary Discourse” to the *Encyclopédie* of 1751, however, Rousseau had emerged suddenly from obscurity to become the most controversial author in Europe.

Rousseau’s metamorphosis began in the fall of 1749. Walking to the chateau of Vincennes to visit Diderot, who was imprisoned there for his subversive writings, Rousseau paused to read the *Mercure de France*, a gazette he had brought along with him, and saw there an announcement for a prize essay competition sponsored by the Academy of Dijon on the question of whether the restoration of the sciences and arts had tended to

purify morals. Rousseau was blinded by a sudden inspiration, the so-called “Illumination of Vincennes,” in which he later claimed to have seen in a single glimpse his entire philosophical system. “At the moment of that reading I saw another universe and became another man,” he recalled in the *Confessions*, “and from that instant I was lost.”

Rousseau’s negative answer to the Academy of Dijon’s question, arguing that the advancement of the sciences and arts tends to corrupt morals, won him the prize. When the *Discourse on the Sciences and Arts* was published in early 1751, Rousseau became famous. The work was widely seen as paradoxical, especially since Rousseau himself was a practicing artist and a contributor to a project dedicated to the advancement of the sciences and arts. Rousseau wrote a number of defenses of his *Discourse*, and of himself. His celebrity spread when he finally succeeded in his chosen profession with the successful performance of his opera, *The Village Soothsayer* (*Le Devin du village*), in 1752. His opera remained one of the most performed pieces at the Paris Opéra well into the nineteenth century.

The *Discourse on the Origin and Foundations of Inequality among Men* (1755), along with the article “Political Economy” for the *Encyclopédie* (1755), cemented Rousseau’s reputation as a controversial political theorist. He later claimed that he only fully revealed the core of his thought in the *Discourse on Inequality*: that man is by nature good and is corrupted in society. His inquiry into human nature and the origins of society in the work culminated in an attack on the corruption and inequalities of his contemporary society.

Shortly after publishing the *Discourse on Inequality*, Rousseau extended his thought to his life by leaving Paris for the nearby countryside to undergo a personal reform. He resolved to make himself financially independent through his trade as a musical copyist, an occupation he pursued for much of the remainder of his life. His decision to distance himself from the corrupt moral and intellectual world of Paris began his alienation from Diderot and his other former friends. His final falling out with Diderot was announced in his next important work, the “Letter to d’Alembert” (1758), which was occasioned by d’Alembert’s article on “Geneva” for the *Encyclopédie*. In his “Letter,” Rousseau objected to d’Alembert’s

suggestion that a theater should be established in Rousseau's native city, where such entertainments were prohibited as a result of the republic's Calvinist heritage, and argued that the theater was appropriate only for corrupted peoples. Rousseau would soon make the same argument about romantic novels, in the preface to his own romantic novel, *Julie, or the New Heloise* (1761). Set in the foothills of the Alps, one of the purposes of his novel, Rousseau explained, was to give his readers a taste for the countryside and to make them disgusted with the corrupt cities that drew them. Rousseau viewed his turn to literature as part of his philosophical mission, and as a way to reach a popular audience by appealing to their literary taste while redirecting that taste toward more virtuous ends. *Julie* would prove the most popular novel of the eighteenth century, and Rousseau was known by his contemporaries foremost for his novel.

Rousseau's reputation today as a political theorist rests largely on his treatise, *On the Social Contract*. Published in April 1762, the *Social Contract* was joined a month later by Rousseau's educational treatise, *Emile, or On Education*, which contains a précis of the *Social Contract* as well as a lengthy treatment of religion. The publication of these two works quickly changed his life.

In June 1762, *Emile* was condemned by Parlement of Paris and the Sorbonne for its unorthodox theological views, and the Parlement of Paris ordered its author's arrest. Rousseau fled Paris on the morning of June 9, passing the men sent to arrest him in his carriage as he rode out. He traveled toward Geneva, only to learn that both *Social Contract* and *Emile* were condemned and burned in his native city. Rousseau settled in Môtiers, a small village in the mountains in the north of Switzerland, where he lived for the next three years. During this period, he published defenses of his two condemned works, justifying *Emile* in his *Letter to Beaumont* (1763), the Archbishop of Paris who had also issued a proclamation condemning the work, and defending the *Social Contract* against its condemnation by Geneva in the *Letters Written from the Mountain* (1764). His later political works include two "applied" works: the *Constitutional Project for Corsica*, begun in 1764–65 at the request of a Corsican patriot, and the *Considerations on the Government of Poland*, written in 1770–71.

Rousseau's stay in Môtiers became increasingly difficult, and he left the village in September 1765 when the inhabitants stoned his house. After a month-long idyll on St. Pierre's Island in the middle of Lake Bienné that he later immortalized in his *Reveries of the Solitary Walker*, Rousseau made his way to his next place of exile, England. He traveled to England at the invitation and in the company of David Hume, but the two philosophers quickly quarreled. Rousseau returned to France in 1767, eventually resettling in Paris, where the authorities agreed not to arrest him as long as he did not publish.

Rousseau completed his first major autobiographical work, *The Confessions*, in 1770. In what is generally considered the first modern autobiography, Rousseau not only recounts his life but presents it as a uniquely honest and accurate portrait of human nature. His readings from the work in small gatherings made his listeners uneasy with his revelations about himself and offended others unhappy with his revelations about them, and the police ordered him to cease. Rousseau wrote two other autobiographical works, *Rousseau Judge of Jean-Jacques*, commonly known as the *Dialogues* and completed in 1776, and the *Reveries of the Solitary Walker*, which he left uncompleted at his death.

In May 1778, Rousseau moved outside of Paris to Ermenonville, the estate of one of his admirers, which would become Rousseau's last refuge, as he died of a massive apoplexy on the morning of July 2. He was buried at Ermenonville and rested there until 1794 when the French revolutionaries moved his body in great procession and interred it in the Panthéon.

The Two Discourses

Rousseau's political thought rests on the theory of human nature and society developed in the *Discourse on the Sciences and Arts* and especially the *Discourse on Inequality*. The essay that made him famous, the *Discourse on the Sciences and Arts*, addresses the question posed by the Academy of Dijon concerning whether the restoration of the sciences and arts tended to purify morals. Although we may today assume that the learned society asking such a question in the center of the Enlightenment would naturally expect a positive reply, the issue of the relationship between morality and

the advancement of the sciences and arts was still hotly contested at this time. Apart from its rhetorical power, what set Rousseau's own essay apart was that he did not rely on traditional religious or civic republican arguments concerning the corrupting effects of secular science and luxurious arts, although he draws on them, but instead offers a scientific or philosophic investigation of the effects of the sciences and arts. The effect of the advancement of the sciences and arts on morals is, he argues, no less subject to scientific study than the effect of the moon on the tides, and can be seen throughout history. In this way, Rousseau first staked out the paradoxical and complex position he would occupy throughout his thought: as a critic of modern thought whose very critique is fundamentally based on modern thought itself.

Although Rousseau at first appears in the *Discourse* simply to condemn the effects of the sciences and arts in the name of religion and patriotism, by the end of the work, he praises the benefits of the sciences as advanced by individuals of such intellectual caliber as Francis Bacon, René Descartes, and Isaac Newton; the corrupting effects of the sciences and arts stems not from the sciences and arts themselves, but rather through their popularization as a social fad that stimulates pride and fosters inequality. The argument of the *Discourse* is therefore complex and somewhat deceptively advanced by Rousseau, and his contemporary readers—and many later scholars—have therefore been confused about his ultimate position in the work or have viewed the *Discourse* as inchoate or even contradictory. The underlying psychological and social arguments of the work concerning pride and inequality would pave the way for his more extensive investigation of human nature and society in the *Discourse on the Origin and Foundations of Inequality among Men* (1755).

Rousseau argues in the *Discourse on Inequality* that all of his predecessors had made the fundamental mistake of assuming that human nature is the same in all times and places; they all thought they had described “natural man” when they had actually described “civil man” or human nature as it is shaped by various forces and especially by social relations. According to Rousseau, human nature is malleable to an extent that no other thinker had previously realized; humans are “historical” beings. Rousseau terms this capacity for change in our passions and faculties “perfectibility,” which he

argues is the defining characteristic of human beings. Rousseau's account of "perfectibility" is, however, largely ironic. Rather than arguing that "perfectibility" is the capacity for the improvement of the individual and the species, he claims that our capacity for change generally leads to our corruption and misery. Rousseau's argument in this regard has two main features. First, he argues that the development of our needs and passions generally outstrips our ability to satisfy these needs and passions, thus, making us unhappy and dependent on others. Second, he argues that, as we come to live in society, our very identity and happiness is dependent on the opinions of others, leading us to wish to appear to be otherwise than we truly are, creating psychological division within ourselves and fostering false relationships in society. Despite his generally pessimistic account of "perfectibility," however, Rousseau never denies that the highest capacities of humans, both intellectual and moral, also depend on our capacity for development. Rather, his argument is that the advances that make possible the intellectual and moral development of a few individuals tend to come at the expense of the corruption and misery of the majority.

Rousseau's *Discourse on Inequality* takes the form of a hypothetical history of human nature, beginning from our original or natural condition and tracing our development up to the present day. In Part I of the *Discourse*, Rousseau describes "natural man" in the "pure state of nature" as an essentially solitary and stupid creature, initially no different than the other beasts. Rousseau's presentation of the initial state of nature is directed largely at Thomas Hobbes, although, importantly, he accepts Hobbes's basic premises concerning the natural egoism of humans and the instrumental role of reason in relation to the passions. According to Rousseau, Hobbes has illegitimately assumed that humans naturally have the needs and passions that would require permanent contact with their fellow humans. Humans can satisfy their primary desire for self-preservation without developing the psychological traits—pride, fear of death, etc.—and their social manifestations—competition, war, etc.—that Hobbes attributes to them. Furthermore, Rousseau argues that humans' naturally limited needs and passions would mean that they by nature lack reason, as well as speech, foresight, and other characteristics that depend on reason that Aristotle, Hobbes, and almost every previous thinker had argued characterize humans. Finally, and centrally for Rousseau's thought, he argues that humans are

naturally “good.” Rousseau does not mean by this that humans are naturally moral, virtuous, or beneficent since he argues that humans originally are not social, rational, or moral creatures. Rather, humans are naturally “good” in that their natural passions and faculties tend toward their self-preservation and well-being as individuals and as a species. In this sense, then, Rousseau can claim that humans as Hobbes described them are “evil” in that their natural passions and faculties lead to their misery and even destruction. By contrast, for Rousseau humans are neither naturally political animals, as Aristotle argued, nor egoistic animals that require the state for their preservation. Instead, for Rousseau, society leads to the corruption of humans, turning “good” into “wicked.”

In Part II of the *Discourse on Inequality*, Rousseau traces the development of humans out of the original state of nature into society and then sketches the development of society up to the present time. According to Rousseau, although humans possess the potential for development, “perfectibility,” that potential need never have developed. Human development, therefore, must be a result of external and extrinsic causes, such as climate or natural disasters, which brought humans into permanent contact with one another and thereby created the conditions for their development. Rousseau imagines how the family and then larger societies might have been established and suggests how reason, language, and other faculties could have developed under those changed conditions. Most importantly, he portrays how our fundamental passions would alter, changing the natural self-love (*amour de soi*) simply concerned with self-preservation into other-regarding pride (*amour-propre*), and generally transforming the heart and mind. Up to this point in our development, these changes in our nature constitute a corruption of our nature to some extent, but they also make us recognizably “human.” Contrary to the common misinterpretation that sees him as romanticizing the original condition of “noble savages” (a term he never uses), Rousseau explicitly argues that the stage of largely developed humans living in small “savage societies” is the best condition for humankind.

This stage of human development, however, comes to an end, perhaps inevitably, with the invention of property. Property makes humans dependent on one another—economically, socially, and psychologically—

and corrupts rich and poor, master and slave alike. Property makes it possible for unnatural inequalities of birth, wealth, and so on, to have a permanent effect on the fates of individuals. Disputes over property lead to a war of all against all, and political society therefore becomes necessary. The very establishment of political society, and then government, however, ultimately leads to the condition of radical inequalities and corruption that Rousseau argues characterizes his own time. Although Rousseau describes the initial pseudo-contract that created political society as a fraudulent ploy by the rich to secure their property against the poor, unlike Karl Marx and other thinkers who would follow him, he sees the establishment of property and of political society as an inevitable and defensible development. The project he undertakes in the *Social Contract* is to make these arrangements legitimate.

The Social Contract

“Man is born free, and everywhere he is in chains,” Rousseau proclaims near the outset of his major political treatise, *On the Social Contract*. His project in the work is to legitimate the “chains” that bind us to one another and to achieve a new kind of political and moral freedom through democratic self-legislation.

Like his predecessors in the social contract tradition, Rousseau argues that individuals are naturally free and that legitimate authority must therefore originate in a conventional agreement. Unlike his predecessors, however, Rousseau insists that we must somehow remain as free as we were before entering the political association for this contract to be legitimate. For Rousseau, we cannot alienate our freedom by consenting to allow others rule over us, even as elected representatives. His solution to this problem is paradoxical: the total alienation of all those joining the political association to the association itself. For Rousseau, the “sovereign” does not rule over “subjects,” as does Hobbes’s sovereign or Locke’s legislative, but rather the people as a whole makes laws for itself in its role as “sovereign” and all obey those same laws in their role as “subjects.” The only legitimate form of political authority is democratic self-legislation, and the members of this republic achieve the civil and moral freedom of true “citizens.”

The “general will” is the term Rousseau uses to describe the will of the sovereign people in its legislative capacity, and this term has caused considerable confusion and controversy. Striking statements by Rousseau such as “the general will is always right” (*Social Contract*, II.3) and “whoever refuses to obey the general will shall be constrained to do so by the entire body, which means only that he will be forced to be free” (*Social Contract*, I.7) have only made debates more heated. The “general will” is sometimes conceived as a mystical popular will, perhaps accessible only to those who rule in the name of the people, as claimed by the French Revolutionaries inspired by Rousseau. Rousseau’s actual conception of the general will, however, can be understood by beginning from its voluntarist foundation. The “will” of the individual is the desire for self-preservation and well-being natural to all humans. The problem that arises as humans develop is that this desire is frustrated, making the political association necessary. The “general will,” then, is fundamentally the same desire of the individual when he or she considers himself as part of the entire political association, as a “citizen.” The general will is always “right” in principle, then, because the citizens by definition desire what is in their interest, but it does not follow that they are always properly informed about that interest. Likewise, people who refuse to obey the general will must be “forced to be free” both because they want the benefits of the political association without bearing the costs and because they cannot otherwise achieve civil and moral freedom. The tension between the “particular will” an individual has considered as an individual and the “general will” he or she has considered as a citizen is the fundamental problem of politics for Rousseau.

The difficulty of getting naturally self-interested individuals to see themselves as citizens, a problem that stems from Rousseau’s theory of human nature, leads Rousseau to discuss the need for the “legislator” (*Social Contract*, II.7). The “legislator” is a kind of founder that makes a people into a people, and Rousseau refers to such traditional examples as Moses and Lycurgus. The legislator cannot accomplish this through legislation, since laws can only legitimately come from the people itself, and must instead do so through creating a shared culture through common customs, mores, and opinions. In addition, Rousseau speaks approvingly of the legislator’s resort to religion to give divine sanction to the community

and its laws, and he devotes the longest chapter in the *Social Contract* (IV.8) to a discussion of civil religion.

Rousseau does not believe, however, that legitimate political institutions and a shared culture can permanently solve the problem of politics. Given the inclination for the natural self-interest of individuals to reassert itself against their identity as citizens, and the related tendency for the government to usurp the power of the sovereign people, Rousseau argues that the natural path for all political associations is ultimately decline and death. His prescriptions are meant to make the chains that bind us in society as legitimate, beneficial, and enduring as possible. The fundamental question for interpreting Rousseau's thought, given his core argument that humans are naturally good but are corrupted in society, is to what extent a properly ordered society can prevent our corruption.

723

Rule of Law

Modern accounts of the rule of law commonly commence with a consideration of the work of legal philosopher Joseph Raz. In a celebrated article, “The Rule of Law and its Virtue,” Raz sets out his understanding of the concept clearly and simply. The rule of law, he argues, is animated by two governing ideas. First, people should be ruled by the law and obey it. Second, the law should be such that people will be able to be guided by it. This latter idea is crucial as it embeds the core ethical principle that underpins the rule of law. As conceived by Friedrich von Hayek, the object of the rule of law is to ensure that the individual can make informed choices affecting the directions of his or her life without arbitrary interference by the state. In their interactions with the state and with other individuals, the rule of law ensures that individuals will be aware of the parameters within which their choices must be framed and will be able to plan their individual affairs on the basis of that knowledge.

On that foundation, Raz sets down several subsidiary principles embodied within larger conception of the rule of law. To meet the ethical objective, the law must be prospective, open, and clear; it should be stable; the manner of its making must be guided by transparent and general rules; it must be applied by a judiciary that is independent and impartial; its procedures should conform to the rules of natural justice; courts must be equally accessible to all; and the judicature should have the power to review the application of law to ensure its conformity with all of these basic principles.

For Raz, the value of the rule of law rests on three foundations. First, the rule of law acts as a bastion against the arbitrary use of power. Power is constrained by the existence and application of clear and accessible rules. Second, it protects individual freedom. That freedom is secured by creating predictability in people's environment so as to maximize their capacity for choice. Third, the rule of law contributes to the preservation of individual dignity. It underpins human autonomy by recognizing people as capable of pursuing their individual objectives and planning for their futures.

Raz's conception of the rule of law is frequently described as formal. This means that it is concerned predominantly with the character of law rather than with its content. From this perspective, the rule of law has little to say about whether a law is good or bad. It is confined to delineating those aspects of law necessary for it to establish its authority and to provide a basic guide to individual behavior. As Raz puts it, the rule of law is just one of the virtues by which a legal system may be judged. It is not to be confused with parallel virtues such as democracy, justice, equality, or human rights.

That Raz confined the rule of law to this formal conception has been the principal source of philosophical objection to it. For other influential philosophers, it is too much, for instance, to accept that the rule of law may coexist equally within both democratic and autocratic systems of government. In an autocracy, the law may be open, accessible, and clear, and therefore capable of being obeyed, but the parameters it places around individual choice may be so constricted as to render any such choice meaningless.

This fundamental criticism has led other legal thinkers to propose a more substantive conception of the rule of law, one that takes the law's content as well as character into account. For Ronald Dworkin, for example, principle matters as much as legality. Dworkin contrasts the formal conception of the rule of law, which he describes as the "rulebook" conception, with his own "rights" conception. This perspective insists that individuals have political rights against the state, in addition to moral rights as against one another. These rights, he argues, must be recognized as essential threads in the rule of law's fabric. They provide the principled foundations on which

individual citizens may approach the courts to vindicate their moral and political claims. The rights conception is in stark contrast to the rulebook approach in that “it requires, as part of the ideal of law, that the rules in the rulebook capture and enforce moral rights” (Dworkin 1985, 12).

The distinction is important because one’s theory as to the nature of judicial adjudication will depend heavily on the attitude one takes toward the competing conceptions. An adherent of the rulebook conception is inclined to the view that hard cases should be decided by endeavoring to determine what is “really” in the rulebook. Having determined that, one applies the rule so unearthed. Followers of the rights conception pose an entirely different question when hard cases must be determined. They ask whether a plaintiff in legal proceedings has the moral right to the legal remedy that they claim. The answer to that question, in turn, will depend on whether the claim runs with the grain of an identified and fundamental right recognized over time as an essential element in the law’s tapestry.

Dworkin summarizes his argument for a substantive conception of the rule of law as follows:

It encourages each individual to suppose that his relations with other citizens and with his government are matters of justice, and it encourages him and his fellow citizens to discuss as a community what justice requires these relationships to be. It promises a forum in which his claims about what he is entitled to have will be steadily and seriously considered at his demand. (Dworkin 1985, 32)

Plainly, the substantive theory of the rule of law incorporates into its essence the idea that every individual possesses certain fundamental rights. These in turn form the basis of individual, moral claims against the state and as against other citizens. The role of courts, then, is to determine according to principle which rights should be recognized by law and to do so by reference to the core democratic value that all people should be treated equally.

Similarly, T. R. S. Allan builds his parallel, substantive conception of the rule of law upon a consideration of the core values that underlie it. It cannot be sufficient, he argues, for the rule of law to adopt a neutral stance as between differing conceptions of justice and fairness. If it is to mean something, it must take a position. That position will be determined by examining and explicating the values that underlie it. For Allan, the core values that underpin the rule of law are liberty, equality, and autonomy.

Human dignity is dependent on individual liberty. A life cannot be described as dignified if it is lived in chains. For this reason, Allan observes, English common law has consistently demonstrated a bias in favor of personal freedom. A rule of law absent a commitment to liberty would not be worth the name. It is the same with equality. The common law has demonstrated a commitment to equality, at least in the sense that the law's underlying principles should be equally and consistently applied. "The consistent application of legal principle, required by the ideal of legality, involves a process of moral reasoning in which inequalities in treatment at the hands of the state have to be justified" (Allan 1993, 43). The law should, therefore, reflect the equal value accorded to every person. That too is essential to the preservation of human dignity. It follows that every citizen must be subject equally to the law and be treated equally by it. No individuals or organizations should be exempt from the law's application. The rule of law secures the value of autonomy through its establishment of a stable framework of rules in accordance with which every individual may make independent and effective life choices. In a free society, everyone should have a fair opportunity to pursue his or her own ends. The rule of law assists by creating legitimate expectations in accordance with which everyone may plot and plan their futures. "A legal system which observes the rule of law meets this requirement in the sense of attempting to guide people's behavior by affecting their deliberations about what to do, thereby respecting their rationality and autonomy" (Allan 1993, 27).

For Allan, to adopt a definition of the rule of law that excludes express consideration of the values that inform it is counterproductive. To do so robs the notion of its texture and power. In hard cases, the judiciary must

necessarily read the law in the light of values and principles essential to the achievement of justice.

How then should these two different conceptions of the rule of law be assessed? Political philosopher Judith Shklar provides a persuasive criterion. The rule of law, she argues, has its starting point in the constraint of arbitrariness. It constitutes a stable system of constraining rules that, because they apply equally to all, limit political capriciousness or, worse, the infliction of governmental cruelty. She sets her argument in the context of what she describes as the “liberalism of fear.” This is liberalism that puts cruelty and fanaticism at the very head of human vices. The fear it seeks to prevent is that “which is created by arbitrary, unexpected, unnecessary, and unlicensed acts of force” (Shklar 1998, 11).

Shklar builds on the work of Montesquieu, whose idea of the rule of law, she observes, was designed to achieve but one objective: to protect the ruled against the aggression of their rulers. The rule of law, applied equally to all, fulfills a fundamental aim. It frees people from the fear engendered by arbitrary governmental action. To be made to work effectively, it requires a complementary institutional innovation. The institutions of power have to check and balance one another. The maintenance of institutional equilibrium is the key to the protection of individual liberty and security. In this, the judiciary is central. It is the institution that must determine whether those who rule have acted in accordance with the law. Its independence is therefore critical. As Shklar puts it,

[T]he idea is not so much to ensure judicial rectitude and public confidence, as to prevent the executive and its many agents from imposing their powers, interests and persecutory inclinations upon the judiciary. The magistrate can then be perceived as the citizen’s most necessary protector. (Shklar 1998, 25)

It is readily apparent that this vision of the rule of law is one consistent with the elaboration of individual rights. These rights perform two, important functions. They create a legal barrier around the individual’s private space beyond which governments may not venture. They create a legal foundation

on the basis of which, more assertively, citizens may make moral claims on the state. Legally recognized rights provide the basis on which a remedy may be pursued for damage that flows from cruel or capricious governmental behavior. Rights constitute the “licenses and empowerments that citizens must have to preserve their freedoms and to protect themselves against abuse” (Shklar 1998, 19).

It follows that if one begins from the conceptual commencement point of arbitrariness, and the fear that it generates, one is more likely to adopt a substantive rather than a formal conception of the rule of law. Turning to the rulebook to determine how matters should be judged provides an inadequate basis on which to provide citizens with the equality of power they require to resist arbitrary action by the state. Without such equality, freedom may be but a chimera. The rights conception, embracing as it does, the institutionalization of rights, the creation of multiple centers of power and a pluralist political order, is far better suited to the task.

As Judith Shklar concludes,

If one then begins with the fear of violence, the insecurity of arbitrary government, and the discriminations of injustice, one may work one's way up to finding a significant place for the rule of law, and the boundaries it has historically set upon these most enduring of our political troubles. It is as such both the oldest and the newest of the theoretical and practical concerns of political theory. (Shklar 1998, 36)

724

Ruskin, John

John Ruskin (1819–1900) was a British art critic and social theorist who dedicated the latter half of his life to an emphasis on social and economic issues.

The complex aesthetic and historical origins of Ruskin's social theory create a dilemma for those attempting to give him a distinct ideological category. His habitual eclecticism, and a complete disregard for party politics, defies easy classification. He strongly criticized the division of labor and delivered a savage attack on the liberal laissez-faire interpretation of classical economics. He was antidemocratic, yet demanded economic justice, and throughout his adult life, he stressed the fundamental Christian ethic of brotherhood and cooperation as incompatible with the values attendant on industrial capitalism. He attracted many distinguished and like-minded sympathizers of all political persuasions, and despite his antidemocratic stance, he became a major influence in the late nineteenth-century socialist revival.

Ruskin's attraction, for socialists, was also complex. In his insistence on state intervention and social stratification, he was antiliberal, but although he associated with the first wave of Christian Socialism in the 1850s through his teaching at the London Working Men's College, he found himself ideologically removed from this disparate group by the strength of his own radicalism. Nonetheless, his emphasis on community and his refutation of laissez-faire economics caused many emergent socialists to

link his name with Robert Owen and secured his later influence on a working-class audience.

If one particular work encapsulates Ruskin's political ideology, then it is *Unto This Last* (1860). In this small book, considered by some to be virtually a socialist manifesto, Ruskin advocated reforms that transgressed all the rules of the non-interventionist economic system. He recommended improvements that have since been realized in the concept of a welfare state and demanded a principle of socioeconomic interaction that helped to redefine the language of political economy. *Unto This Last* was initially not well received but ultimately became a powerful authority among socialist sympathizers.

The economist John A. Hobson is an important example of the often diffuse nature of Ruskin's influence. Hobson was the leading intellectual force behind New Liberalism and sought, fundamentally, an accommodation of socialism and liberalism. He took two basic principles from Ruskin: first, the principle of humanism, which defined Ruskin's economic critique, and which prompted Hobson to believe that all scientific principles should be subordinate to ethical ones, and, second, an organicist vision of society that led Hobson to reinterpret his own concepts, away from individualism toward a collectivist ideal of social welfare. Hobson tried to give Ruskin a socialist label, while drawing from a theory of social organization that was essentially conservative. Ruskin's organic theory, however, was derived, not from Edmund Burke, but from a consideration of the construction of a Gothic cathedral—integrated, but hierarchical, and ultimately producing a transcendent moral or spiritual dimension.

Ruskin tried to realize his ideal community through the establishment of The Guild of St. George in the 1870s. His vision was a form of agrarian utopia where the buying and securing of land would enable English men and women to work in harmony for the common good, thus, saving them from alienating industrial processes and ensuring a return to lost values. He did not want to recreate the past but to use it as an example of a successful economy based on agriculture and crafts—a form of feudal socialism—communal but hierarchical, which he wanted to adapt to the welfare of

current workers. His scheme, like most of his practical experiments, was ultimately unsuccessful, but his philanthropic legacy still resonates today.

Ruskin's influence permeated not only left-wing politics but also the world of trade-unionism. His impact lingered well into the twentieth century through his relationship with guild socialism, a movement designed to promote individual creativity. Among the many individuals who professed a considerable debt to Ruskin are William Morris, who was heavily influenced by Ruskin's account of work; the positivist thinker Frederic Harrison; Leo Tolstoy; and Mohandas Gandhi. Whatever conclusions people reach as to Ruskin's political orientation, it must be remembered that he was more influential than Karl Marx in the development of British socialist thought.

Russell, Bertrand

Russell, Bertrand

724

725

Russell, Bertrand

Although he is best remembered today as an analytical philosopher and mathematician, Bertrand Russell's (1872–1970) political views had a notable impact in the English-speaking world during the twentieth century. He can be described as a “public intellectual,” as famous for his controversial views on topics such as religion, warfare, women's rights, marriage, and education as he was for purely academic studies. His most important political works were probably *German Social Democracy* (1896), *The Principles of Social Reconstruction* (1916), *The Practice and Theory of Bolshevism* (1920), *Marriage and Morals* (1929), *Power* (1938), *A History of Western Philosophy* (1945), and *Human Society in Ethics and Politics* (1954).

Originally born into a junior branch of the English aristocracy, Russell lost both his parents before he was four years old, and he was brought up in Surrey by his paternal grandmother and a succession of governesses and tutors. From 1890 to 1916, he was successively an undergraduate, a researcher, and a lecturer at Cambridge University; he was then deprived of the latter position because of his opposition to World War I. Having already attracted controversy by standing as an unsuccessful “Votes for Women” candidate at a parliamentary by-election in 1907, Russell was imprisoned in 1918—and later in 1961—because of pacifist agitation. Consequently, he spent much of the interwar period researching, teaching, and lecturing in Russia, China, and the United States, but he still found time to lose two further elections (for the Labour Party in 1922 and 1923) and to set up a

“progressive” school at Beacon Hill, Sussex, in 1927. Later, Russell seemed to have rejoined “the establishment” when, thanks to a quirk of dynastic inheritance law, he became an Earl in 1931, was readmitted to the staff of Cambridge University in 1944, and won the Nobel Prize for literature in 1950. However, in his final years, he reestablished his radical credentials by campaigning for nuclear disarmament and against the Vietnam War. Russell was married four times and had three children; he died of bronchitis in Wales shortly before his ninety-eighth birthday.

Russell’s Political Thought

Russell’s politics were originally liberal, and he maintained his concern for individual freedom and conscience throughout his career, but he became a Guild Socialist during World War I, an affiliation that continued into the 1920s. Later, in the 1960s, he abandoned the Labour Party and became a (non-Marxist) “New Leftist.” Generally sympathetic to the poor, but opposed to Marxism and Bolshevism, Russell supported the decentralized egalitarianism of the Guild system, although systematic programs were never his preference. Even his most philosophical politics book, *Human Society in Ethics and Politics*, was relatively polemical because he did not believe that moral judgments could bear the standards of objectivity that other branches of philosophy enjoyed, although he tried to avoid pure relativism. Russell’s pacifism was consequentialist, rather than absolute, for he supported World War II, while his social politics involved advocacy of female emancipation, opposition to strict divorce laws, qualified support for progressive education, and severe hostility to organized religions. He was also an advocate of world government, although he assumed that this would probably arise from the hegemony of a “Great Power,” as opposed to a democratic campaign for peace.

Russell’s influences are many. According to many experts, Russell virtually invented modern analytical philosophy (the theoretical reconciliation of natural language, formal logic, mathematics, and physics), and there is broad consensus that this aspect of his work was inspired by the Italian logician Giuseppe Peano, the German mathematician Gottlob Frege, and Russell’s fellow Cambridge philosophers George Edward (G. E.) Moore and Alfred North Whitehead, as well as the American realist philosopher

William James. However, the sources of Russell's political views—other than his own experiences and interpretations of contemporary events—are more problematic. John Stuart Mill, the early-modern Dutch philosopher Baruch Spinoza, and the twentieth-century social scientist G. D. H. Cole are usually mentioned with reference to the liberal and socialist aspects of Russell's career. His cynical attitude toward actually existing governments owed something to Niccolò Machiavelli, while his inspirational assumption—that politics and ethics cannot and should not be separated—was part of a tradition that began with the ancient Greeks and, in particular, with Aristotle.

Russian Political Thought

All European high culture, most especially that which could be called “political,” rests fundamentally on the twin pillars of classical antiquity and Christianity, but the different European national variants took shape at different times and derived from different aspects of both classical and Christian traditions. Some traditions of political writing and thinking, like those of England and France, may be traced back to the later Middle Ages. The political thought produced in Eastern Europe, on the other hand, is much more recent in development and its outlines more difficult to discern. This is partly because so much of this writing derives from the less studied evolution of the Orthodox (Eastern) religious tradition or, at any rate, has been marked by it. The political element within the world long dominated by Eastern Orthodox Christianity is altogether less specific and articulated than comparable developments further west and of much more recent date. Orthodox tradition was Platonic and aesthetic, with a definite aversion toward the Aristotelian and hence toward the rationalism so characteristic of Euro-American modernity. This is particularly true of Russia, with its vast, rural spaces, shifting frontiers and imperial pretensions. Until the second half of the seventeenth century, all public forms of “political thinking” took place in an arena dominated by the Church.

The traditional position that Russia’s specifically political thought began with Peter the Great (1682–1725) will be respected here. What has been described as “Muscovite political culture” consists of generally diffuse, and occasionally very specific, tendencies toward secrecy and facades. It

expresses in part the pessimism of a vast and poor realm, stretching far from the centers of Europe, but not connected in any deep way to the civilized centers of East Asia, and its provenance is mired in controversy.

The reign of Peter the Great inaugurated Russia's direct involvement in the increasingly secular culture of early modern Europe. As Russia's political interest shifted away from the steppe frontier toward its western borders, Tsar Peter discovered that Russia lacked the ability to compete geopolitically with European nations; his realization of Russia's military weakness led to larger understandings of how culture underlay specific sources of West European strength. Trying to introduce these sources of strength into his native realm, he produced policies entailing a crude form of mercantilism, a commitment to industrialization, and an attempt to end the domination of the Orthodox Church over domestic life. Central to this effort was the ending of the Russian Patriarchate and the creation of a state-dominated framework (the Holy Synod) to govern the Russian Church.

The eighteenth century may be broadly understood as "the Russian Enlightenment," a very top-down affair. Until the early nineteenth century, the ruler and the court remained the cultural center of Russia, ruling by decree under Peter and somewhat more through the power of fashion, emulation, and persuasion as the century wore on. The Petrine reforms had a direct impact on only the top one or two percent of the population, but all Russians, even the enserfed and the peasantry, were affected. The imperial court, of course, was a very different place under Peter than it had been under his predecessors. It almost completely reversed its previous position as the linchpin of tradition, becoming the center of cultural innovation, a development already underway, if imperceptibly, before Peter came to power. The Petrine Westernizing impulse at court came to an end in the reign of Alexander I (1800–25).

In large part because of the "Northern War" with Sweden, the Europe that Russia became part of during Peter's reign was, indeed, northern and Protestant. Russia's largely unarticulated political institutions were reformed along Swedish lines, and the Patriarch was replaced by synodal government. St. Petersburg, the new capital, symbolized the distilled ambitions of eighteenth-century Russian rulers, above all those of Peter and

Catherine the Great. With Peter on the throne, the city's planning models were Dutch, its architectural models were all West European, and the buildings were created by a succession of West European masters, French, Italian, and English. Its physical forms "represented the ideas of power, order and reason" (Dorontchenkov 2009, 130).

Feofan Prokopovich, probably Peter's most important adviser on intellectual and cultural matters, wavered initially between Catholicism and Orthodoxy but quickly realized which side his bread was buttered on and took service with Peter. Ukrainian born and an intellectual eclectic, his theology was initially Catholic and scholastic, his political impulses authoritarian and Protestant, and his intellectual bent classical and imperial. His writings on absolutism (*Justice Is the Monarch's Will*) and his Funeral Oration on Peter the Great were the best known of his many works. His *Spiritual Regulation* established the governing framework for the Orthodox Church.

The most important writer on political subjects in the second half of the eighteenth century was undoubtedly the Empress herself. Catherine the Great was a woman of extraordinary vitality, in her cultural ambitions and in her quest for power, both at home and abroad. Peter had put the German philosopher J. G. von Leibniz on his payroll, but Catherine topped him with Voltaire and Denis Diderot. Her interest in French culture and its greatest representatives was legendary; the most important indication of her passion for advanced ideas was her famous correspondence with Voltaire, which lasted from the time she came to the throne (1762) until he died in 1778. She was also a particular admirer of the French *philosophes*, Diderot and Jean Le Rond d'Alembert.

Catherine's Instruction (*Nakaz*) was a justification of absolute monarchy, based on the political theory of the Enlightenment, and a description of how the state should be governed. Autocracy was justified on the grounds of efficiency and effectiveness. Russia was proclaimed to be a European state and her subjects citizens. Laws were to conform to the rational order of nature, rather than being determined by historical evolution or tradition. The aim of legislation was to conduct the people to "the greatest good,"

language reminiscent of Jeremy Bentham, who was in fact an honored visitor to Catherine's Russia.

Two important books lay behind the occasionally confused and repetitive verbiage of Catherine's *Nakaz*. One of them was Charles-Louis Montesquieu's famous *Spirit of the Laws*. The other was Cesare Beccaria's *Treatise on Crimes and Punishments*, one of the milestones in the development of modern criminal law doctrines and procedures. Catherine was indebted to Beccaria for her ideas as to the purpose of legislation and for specifics, like the abolition of judicial torture. To Montesquieu she owed her conviction that unlimited monarchy could be made "rational" and for the idea that what he called "intermediate bodies" between the sovereign and her subjects were a desirable check on arbitrary rule.

Throughout the eighteenth century, the elite (with a few notable exceptions) followed the court, identifying with Peter, his reforms, and his drastically European orientation. Around the turn of the nineteenth century, however, doubts began to surface. Ironically, Catherine's efforts to incite cultural activity among her subjects, newly promoted to citizens, contributed to new points of view, increasingly unwelcome in the capital. The Freemason Nikolai Novikov, while remaining "Western" in his overall outlook, began to take an interest in the populations of the Russian Empire and how Russian society was constituted. He also came to feel some violation of filial piety in the relentless glorification of Peter's reforms. Russia's old ways, the ancestral ways, were being slighted. Speaking to just this point, Prince Mikhail Shcherbatov produced the unpublishable anti-autocratic tract, *On the Corruption of Morals in Russia*. And ultimately the litterateur and historian Nikolai Karamzin spoke of Petersburg as having been built on "tears and corpses" because of the abruptness and violence of Peter's break with the past.

The Napoleonic wars brought many Russian aristocrats in direct contact with Western Europe, which previously they had known largely from books. Their so-called Decembrist Revolt brought Peter's admiration for Western cultures to a preliminary climax, while turning the force of revolt against the failing commitment of tsar and court to Westernization and constitutionalism. When these issues reemerged as central to Russian

culture in the late 1830s, however, the torch had passed to that remarkable band of rebels that came to be known as “the intelligentsia” and that included a sprinkling of people from less exalted social positions.

Romanticism held increasing sway in Russian culture, and the intelligentsia was becoming obsessed with Russia’s future. In 1835, Alexander Pushkin’s solitary and philosophically minded friend, Peter Chaadaev, published his remarkable “Philosophical Letter to a Lady” in a Moscow periodical. The resulting impact was later described as “a pistol shot in the dark night.” In the decade after the defeat of the Decembrist rebels, Chaadaev had come to believe the heretical proposition that the classical and Christian world—of which Rome was the center—was the true locus of historical development in the cosmos. Russia had been cut off from that world since the Middle Ages. The inevitable result was that Russia—having neither learned anything from Europe nor having contributed anything to its development—had no real history and remained, as Chaadaev memorably put it, standing “with one foot in the air.”

The result of Chaadaev’s shocking diatribe was the crystallization of a new point of view, which came to be called Slavophilism. The Slavophiles, of whom the two most important were Aleksei Stepanovich Khomiakov and Ivan Vasil’evich Kireevsky, came into existence as a group to combat Chaadaev’s dismissal of Russian history and culture. Strikingly, the Slavophiles accepted some of Chaadaev’s distinctions between what soon became known as “Russia and the West,” but they reversed the values that Chaadaev ascribed to each. The Catholic West became the bearer of rationalism, legalism, and hierarchy. Its dialectical opposite, Protestantism, stood for unbridled individualism and boundless subjectivity. The Russian Church, by contrast, had preserved the “conciliarism” (*sobornost*) of early Christianity; the Roman Catholic Church, deeply influenced by Aristotelianism and Roman rationalism, had taken the road to hierarchy and ultimately papal despotism. Although the Russian upper class had been deeply corrupted by Peter the Great’s Westernism, the Russian peasantry was largely untouched by Western ways and still believed in the collectivity of true Christianity, despite the coarseness and poverty of their daily lives. The history of “the West,” therefore, although marked by the achievement of unprecedented material wealth and power, was fundamentally un-Christian, even godless, while Russia, although thrown off course by

Western influences, was still in a position to save her soul by returning to “the good old ways.”

The Slavophile critique of “the West” had a decisive influence on all pre-Soviet Russian culture, particularly those segments of it that pertained to politics. Slavophilism, in its initial formulation, was about history and culture, not about politics. The “Panslavism” that briefly emerged as a major school of thought during the 1870s and early 1880s turned the political indifferentism of the Slavophiles into a fierce hostility to Russia’s contemporary political rivals in Europe—particularly to those that spoke German. And in the early twentieth century, a Russian nationalism emerged that kept a crude version of a few core Slavophile ideas but otherwise spoke in imperial terms.

The intellectual force that contested neo-Slavophile and nationalist currents for intellectual leadership in late imperial Russia was of course Marxism. In the First International, Michael Bakunin’s anarchism challenged Karl Marx’s doctrines for personal hegemony head on. Subsequently, however, the Russian intellectual, George Plekhanov, although living in exile after 1881, became an important figure in European Marxism. It was principally against Plekhanov’s rather mainstream European Marxism that Vladimir Il’ich Lenin developed his Bolshevism. Its distinctiveness lay in its view that because of the weakness of the bourgeoisie in Russia, the industrial proletariat might—in alliance with the Russian peasantry—skip the capitalist stage of development and proceed directly to socialism. To accomplish this feat, Lenin developed the idea of a vanguard political party that would lead the Revolution and ensure that significant figures in the movement did not succumb to a purely economic struggle for better wages and working conditions, or to other forms of liberalism.

Precisely why the Russian Revolution developed in such an extremely authoritarian direction has been a matter of great controversy, with some scholars crediting the dogmatism of the Bolsheviks and their readiness to employ violence as the root cause, and others pointing to the violence and hardships of the Russian Revolution and Civil War as having damaged the democratic possibilities of the Russian Left, forcing the Bolsheviks in particular into more extreme positions.

The Soviet experience, although rich in the annals of utopian hopes and of human suffering and degradation, is poor in writing about politics; the more interesting Marxists writing about politics has been by Hungarians, Italians, and Germans. The life of Stalin, however, has a great deal to teach the student of modern politics, almost all of it thoroughly chastening. Russian politics between 1925 and 1955 combined the dreadful toll caused by the struggle with Germany with a massive commitment to accelerated economic development that eventually left the post-Stalin Soviet Union unable to compete internationally with the more nimble capitalist polities of Western Europe and the United States. The collapse of the Soviet Union in the 1990s led to further suffering for the inhabitants of the Soviet Union after the illusory stability of the Brezhnev period. Russia today, much reduced in power and influence, to be sure, still occupies a space sometimes called Eurasia, still culturally illiberal, her economy increasingly “colonial,” under an authoritarian crony capitalist government.

Russian Revolution, Political Thought of the

Concepts of revolution in Russia became very diverse very rapidly in the 1860s among a small group of intellectuals who were disappointed by the limited nature of the reforms of the period, the most important of which was the abolition of serfdom in 1861. The main motivation was a moral one, going back to the works of earlier intellectuals, notably Alexander Radishchev, who wrote one of the earliest critiques of Russian society in *A Journey from St. Petersburg to Moscow* (1790), which chronicled the hardships of the peasantry. Radishchev's statement, that he could not be indifferent while others suffered, stands as the founding statement of Russian revolutionary thought. From the 1860s, the term *narodnichestvo* (populism), derived from the word *narod* (the people), was applied to the movement. Initially, following the teachings of Peter Lavrov, who argued for political education as the way to achieve revolution, hundreds of students went out into the countryside in 1873 and 1876 to preach revolution to the peasantry, but the peasants did not respond. Other revolutionary models at that time included those associated with the anarchist Michael Bakunin, who prioritized the struggle against the state and the church; Sergei Nechaev, who wrote the infamous *Catechism of a Revolutionary* (1869), which called on followers to cut all social ties to pursue "the single passion, revolution"; and Nikolai Chernyshevsky, whose widely influential novel *What Is to Be Done? Stories of the New People* (1863), depicted a utopian communal existence.

The failure of the “going to the people” in the mid-1870s led a breakaway group to argue that only terrorism would be effective as it would demonstrate the vulnerability of the oppressors. From 1878 to 1881, numerous attacks were made on people and targets associated with the autocracy, culminating in March 1881 in the assassination of Tsar Alexander II. The attempt failed in its prime objective of encouraging a mass uprising among the peasants, although it did cause the government to become more repressive and to aggressively “Russify” the Empire, policies that contributed to the eventual revolution. Once again, failure caused a reevaluation led by Georgii Plekhanov who began to argue, following Karl Marx, that the populists had chosen the wrong revolutionary class. Although insignificant in Russia in the early 1880s, it was, Plekhanov argued, the working class that was destined to grow as capitalism and industrialization spread and to lead the future revolution. The three main tendencies of Russian revolutionary thought—populism, Marxism, and anarchism—had emerged. The initial “populist” impulse of serving the people remained fundamental to all of them. Populism can be considered the mother lode of Russian revolutionary thought.

Populism and the Socialist Revolutionary Movement

The various informal political tendencies began to form themselves into political parties around 1900. They were forced to set up abroad or in secrecy within Russia. The populist tendency coalesced into the Socialist Revolutionary Party (SRs) in 1901. It was the most widely supported party in the Russian Empire and remained so until its dissolution by the Soviet government, getting about twice as many votes (around 45 percent) as the ruling Bolsheviks (around 25 percent) in the only free election of the period (for the Constituent Assembly in November 1917). At the heart of its philosophy was the belief that landowner land should be transferred to the peasantry. Their ideas and policies were not focused exclusively on peasants. They also organized among Russia’s growing number of factory workers, most of whom were migrants from the countryside. The SRs at this time were also distinctive in continuing to embrace a philosophy of terrorism. Alongside the more open political wing it also operated a

“Combat Organization” that conducted numerous terrorist acts against tsarist targets, helping to build the tension prior to and during the 1905 Revolution.

Despite being bitterly opposed to the Social Democratic Party, the SRs were also heavily influenced by Marxism. In fact, it was a populist economist named Nikolai Danielson who completed the first translation of *Das Kapital* into Russian. Danielson remained in correspondence with Marx, as did other populists, until Marx’s death. The question they raised was, could Russia—with its precapitalist economic formations, shortage of capital, constricted markets, high production costs (not least in combating the bitter climate), and traditions of communal peasant land ownership and urban co-operative workshops—avoid capitalism and go straight to socialism? Marx, in two carefully worded letters in 1878 and 1881, conceded that it might be possible. Mainstream populist economists differed over the issue. Some, like V. P. Vorontsov, thought Russian capitalism was a nonstarter because of its disadvantages. Others, like N. M. Mikhailovsky, believed capitalism could develop but that it was possible to preempt it by a leap into socialism. Danielson believed there was already some capitalist development, but it could be foreshortened. All, in various ways, believed Russia would not have to undergo the full agony of a whole era of capitalist development. Populists envisaged a future socialist Russia based on communal peasant agriculture and small-scale industrial co-operatives.

The defeat of the 1905 Revolution led to a long lull in revolutionary activities that resumed with a vengeance in 1917. From the outset, populists were attracted to soviets and tended to hold majorities in many of them. However, the party began to split under the tensions and complexities of the combined world war and revolution. Deeming it impossible to immediately distribute the land under wartime conditions, the party leaders were drawn out of soviets and into the provisional government in the belief that all antimonarchist forces should defend the February revolution and keep the external enemy at bay. However, the party left, including one of its most prominent politicians, Victor Chernov, could see the damage this was doing to the party and urged rapid transfer of land. Therefore, when the Bolsheviks came to power, they “stole”

SR policy and approved the self-transfer of land being spontaneously undertaken by peasants at that moment. Chernov had a deep mistrust of Bolshevik aims, but much of the left split from the SR leadership and formed a militant left-SR party that was in coalition with the Bolsheviks from November 1917 to March 1918 when they resigned rather than sign the catastrophic Brest-Litovsk peace treaty with Germany. The SRs attempted a half-hearted uprising against the Soviet government in July 1918 after which they were suppressed. A group of leaders was put on trial in 1922 in the first Soviet political show trial. Fifteen were sentenced to death, but the sentences were commuted. However, populism never recovered.

Social Democratic Marxism—Mensheviks and Bolsheviks

Social Democratic Marxism differed from populism in emphasizing the role of workers in leading the revolution. Social Democrats also criticized populism for its romantic depiction of the heroic revolutionary, especially the self-sacrificing terrorist. Instead, Social Democrats tended to stress the structural and scientific nature of Marxist theory in which history swept along irrespective of the individual. By the time Vladimir Lenin (1870–1924) began to emerge as a Marxist, the Revisionist controversy, driven by the question of why no workers' revolution had taken place by the late 1890s, was dominating Marxist thought. Picking a path between populism and revisionism, Lenin addressed the problem by developing two major adaptations of Marxism to Russian conditions, that is, to its situation of political unfreedom and restricted development of capitalism. In his pamphlet *What Is to Be Done?* (1902), he argued that the absence of an organized party was crucial. He argued that the German Social Democratic Party model from its underground phase should be followed. At first, the pamphlet was accepted as a brilliant contribution to orthodox Marxist thinking. It was only when Lenin began to use ruthless tactics to get his way in the embryonic party at its Second Congress (1903) that the potential authoritarianism in Lenin's conceptions began to attract criticism. A group suggesting a less centralized form of party opposed Lenin. There followed 14 years of argument between the Menshevik (minority) and Bolshevik

(majority) factions in which it is difficult to discern clear and consistent ideological differences. Constant attempts were made to reunite the factions even well into 1917. Lenin was determined to keep them apart. Lenin's second adaptation was to stress the international nature of the revolution. Russia, as one of capitalism's weakest links, might start the international revolution, but it stood no chance of success in "backward" Russia without the help of successful revolutions in Germany and/or France and Britain. Lenin developed this notion in *Imperialism: The Highest Stage of Capitalism* (1916).

By 1917, as his attention began to turn to problems of transition to socialism, Lenin had made a third adaptation of Marxism, inspired this time by Rudolf Hilferding's views on *Finance Capital* (1910). Hilferding argued that capitalism had become an organized system. Managers controlled banks that, in turn, controlled investment flows. Managers also controlled large companies that themselves were moving away from the market toward monopolies and cartels. Lenin identified this as a revolutionary opportunity. In the first instance, one could simply behead the system by nationalizing the banks and a future socialist government would be able to control capitalism and coerce it toward socialism. His *April Theses* (1917) and his unfinished *State and Revolution* (written in 1917, published in 1918)—which compared running a modern economy to the routine of the German Post Office, requiring only simple skills within the compass of the average working man or woman—embodied this as a fundamental feature of his strategy for transition to socialism in 1917.

The final twists and turns in Lenin's thought were driven by the failure of successive transition strategies. The "simple" beheading of capitalism did not work as bankers, capitalists, and others preferred fight or flight to subordination to the Soviet government, forcing a change of direction in spring 1918. Lenin turned to a second strategy, the idea of "iron proletarian discipline" in factory and society, extensive state control and planning of the economy, plus defense of the Russian revolution at all costs, even retreat to the Urals, in order to maintain a possible starting point for revolutions elsewhere. The term "war communism," conventionally applied to these policies, conceals their close similarity to what was later known as "socialism in one country." In 1920–21, this strategy also failed in that the

deep opposition of peasants to forced grain requisitioning meant a third strategy was needed. A tax in kind replaced forced requisition, and partial market relations were restored. Lenin waxed lyrical in his last articles, saying that experience had brought the revolution to a theoretically unpredicted place, one of socialist political control over a society lacking the economic and social “preconditions” for socialism. Lenin argued that the missing preconditions would be constructed by the political authorities guided by Marxist theory. Lenin had died by the time this third transition strategy had begun to fail, and Stalin picked up where the second strategy had left off and turned it into what is commonly known as “socialism in one country,” that is, adapting, not least by vastly extending the control of state and party over society, and waiting until the revolution spread.

The main non-Leninist political theories of the revolutionary period involved Leon Trotsky and Menshevism. Trotsky had developed a theory known as “permanent revolution” in the early twentieth century. In essence, it stated that in Russian conditions, it would not be necessary for there to be an extended capitalist stage of development because, although the working class was weak in Russia, the ruling class was relatively weaker and divided. The nascent bourgeoisie had not attained maturity and strong social hegemony as it had in more advanced capitalist nations. Nonetheless, the Russian revolution would only succeed as part of a world revolution that undermined capitalism in general. Trotsky strongly opposed the theory of socialism in one country. He attributed the domination of the Russian Communist Party by Stalin to bureaucratic degeneration brought about by having too many careerist administrators and too few class-conscious workers in the leading party positions. Most Mensheviks, on the other hand, believed it was not possible under any circumstances for the capitalist stage to be skipped. Only as capitalism developed and eventually decayed, they argued, could the necessary preconditions for socialism—a strong, class-conscious proletariat and an industry capable of producing an abundance of goods—be achieved. In their view, the Russian revolution was “premature.”

Finally, outside the Marxist tradition altogether was a small but at times influential group of anarchists. Apart from the fundamental sharing of opposition to any and all state structures in favor of direct, participative self-government, the movement had little in common. One of the largest

groups was composed of pacifists who followed the teachings of Leo Tolstoy. Peter Kropotkin argued for a decentralized, stateless society based on co-operatives. Other anarchist groups advocated violence as a necessary revolutionary tool, and some embraced terrorism as the only way for revolution to progress under Russian conditions.

Saint-Simon, Henri de

Saint-Simon, Henri De

733

734

Saint-Simon, Henri de

Claude-Henri de Rouvroy, Comte de Saint-Simon (1760–1825), is acknowledged as a forerunner of socialism, industrialism, positivism, and sociology. His philosophic works, which commenced in 1798, emerged as a synthetic response to contested social, political, and intellectual terrains not limited to the Protestant Reformation; the Enlightenment; the French and Industrial revolutions; the rise of individualism, democracy, and the mercantilist middle class; imperial competition and warfare; and the use of arbitrary and discretionary power by the church and state. Among his most significant works were *Lettres d'un habitant de Genève* (1803), *Introduction aux Travaux Scientifiques du XIX Siècle* (1807–08), *De la Réorganisation de la Société Européenne* (1814), and *Nouveau Christianisme* (1825).

During his first 40 years, Saint-Simon received a rural education in classical literature, which was complemented by an encyclopedic training in Enlightenment philosophy in Paris, and culminated in the rejection of theism in the 1770s. He fought in the American War of Independence from 1779 to 1782, rising to the rank of colonel. He soon became disillusioned with warfare and undertook the coordination of infrastructural projects in Mexico and Spain. After these fruitless ventures, he returned to France in 1793 to speculate in properties confiscated by the First French Republic.

His earliest published works appearing from 1803 were unsystematic but synthesized the works of the Marquis de Condorcet and Joseph de Maistre.

Calling for a subscription of funds, Saint-Simon wished to organize a council of international intellectuals to unify the sciences based on Isaac Newton's law of gravitation. With the purpose of forming a progressively modifiable scientific doctrine to validate their authority as the leaders of a "Religion of Newton," savants would replace the waning authority of the Catholic Church, guiding intellectual and social progress. Property-owning industrialists would take the temporal power and supplant the absolute rule of kings. The rise of these new powers would direct the transition to a peaceful industrial system, or a positive era. During his 1814 collaborations with Augustin Thierry, Saint-Simon emphasized that an intellectual elite could form a parliamentary organization to arbitrate international peace processes.

Motivated to shape public opinion on science, industry, and economics, he founded the journal *L'Industrie*, which promoted the liberal economic theories of Jean-Baptiste Say and Benjamin Constant. It appeared from 1816 to 1818, ceasing when subscribers reacted negatively to the proposition that universal morality was possible under the direction of new spiritual and temporal realms: science and industry. Among Saint-Simon's succeeding publications, *L'Organisateur* of 1819–20 also proved controversial, as it questioned the utility of idle Bourbon royalty, which he juxtaposed to the exertions of scientists, industrialists, and laborers contributing to the prosperity of France.

By the early 1820s, he had already elaborated on his newly planned industrial economy as consisting of three branches. Within this system, a creative class of artists and engineers were positioned to envision cultural and industrial schemes, a scientific class would scrutinize the feasibility of such plans and administer education, while an industrial class would direct workers and manage the realization of industrial projects. During the year of Saint-Simon's death, three publications, notably *Nouveau Christianisme* (1825), appeared. The unfinished piece criticized ancient institutions for demoralizing humankind. Saint-Simon called all to uphold the Golden Rule as a return to the spirit of Christianity. The work was consistent with his proposals to establish a merit-based society administered by a republican elite, and gauged by the social sciences. It made no concession to inherited

wealth, privilege, or warfare. As it would tend to the poorest class first, democratic processes were unnecessary.

His followers, the Saint-Simonians, would eventually transform his philosophy into a religious creed and promote a socialistic interpretation of his economic system. They were also indebted to the works of Charles Fourier and used the word *socialisme* to define their moral creed. These developments led Karl Marx to label Saint-Simon a “utopian socialist” for contending that morality could foster class cooperation, as contrasted to his propagation of the dualist class conflicts of political and revolutionary “scientific socialism.” John Stuart Mill, however, would build on Saint-Simonian ideas of egalitarianism, particularly in relation to the restriction of inheritance rights.

Despite the fact that Saint-Simon’s most famous follower, Auguste Comte, had defected from his lead in 1824 as a result of his differing estimations of the positive era, he would play a critical role in systematizing and promoting the potentialities of industrial reorganization. Comte developed a classification of the sciences in the six-volume *Cours de philosophie positive* (1830–42) with the purpose of substantiating a new science of sociology. This work served as the basis of the four-volume *Système de politique positive* (1848–54), which detailed a scheme for transitioning to a pacific confederation of industrial city-states that tend to the needs of society via Positivist sociology. The principles of this work, particularly its details for a “Religion of Humanity,” played a formidable role in Victorian civic reconstruction as promoted by various members of the British Positivist Society, and later the Sociological Society. Prominent members of these civic institutions included Richard Congreve, Frederic Harrison, J. H. Bridges, S. H. Swinny, Patrick Geddes, and Victor Branford.

Sartre, Jean-Paul

Sartre, Jean-Paul

734

736

Sartre, Jean-Paul

During his lifetime, Jean-Paul Sartre was often described as a “guide to a generation.” With his thick-rimmed glasses, his ubiquitous dangling cigarette, and his practice of frequenting the cafés on the Boulevard Saint-Germain in Paris, he appeared to be the quintessential “committed intellectual,” using his writing and his name to take a stand on all the major issues that defined the French intellectual and political scene from the 1940s to the 1980s. However, Sartre’s politics were far from consistent. Although he remained committed to certain ideals, in particular to a certain existential Marxism, his political views were continually evolving and adapting to new contexts and new paradigms. As Sartre’s biographer Annie Cohen-Solal (2005) put it, Sartre’s political thought is best understood, not so much as a uniform doctrine or body of work, but as a “way of doing things,” as an “ethical compass.” The most important thing, Sartre reminded us, was to “think against oneself.”

Born in 1905 in a Parisian bourgeois family, Sartre’s political awakening came late. During the 1920s, he studied philosophy at the *École Normale Supérieure*, where his peers included Georges Canguilhem, Raymond Aron, and Paul Nizan, who introduced him to politics. In 1929, while studying for the *agrégation*, Sartre also met another philosopher, Simone de Beauvoir, who became his lifelong companion. Sartre’s early philosophical interest was in phenomenology, in particular in the work of Edmund Husserl, whom he discovered through Emmanuel Lévinas. For Sartre, phenomenology

offered the possibility of placing real-life experience—the “concrete”—at the heart of philosophical reflection.

In 1938, Sartre published his first novel, *Nausea*, in which he exposed some of his earliest philosophical ideas. *Nausea* recounts the internal turmoil of Antoine Roquentin, an ordinary man who wrestles with the absurdity and contingency of his existence. Although this realization leads Roquentin to a loss of direction and sense of self, to a vertiginous “nausea,” it is ultimately an empowering experience. Stripped of any predetermined structures, Roquentin comes to understand that he is a pure consciousness and, as such, that he is essentially free. Existence, as Sartre famously put it, precedes essence.

In *Being and Nothingness*, published in 1943, Sartre continued to develop his theory of existentialism. He pursued his critique of determinism and insisted on the centrality of freedom of both action and consciousness. In the face of the subject’s new-found freedom, Sartre preached authenticity, a disposition also involving self-reflexivity and self-criticism. The denial of freedom, Sartre argued, led to “bad faith,” to self-deception and *ressentiment* (resentment). The choice of freedom for oneself and for others ultimately led to political commitment, which Sartre came to embrace fully after World War II.

In June 1940, Sartre was captured by the Germans and sent to a work camp. This experience was crucial not only for his philosophical trajectory, as he was developing the main themes of *Being and Nothingness* during the war, but also for his political engagement. In 1941, Sartre founded the underground Resistance group “Socialisme et liberté” along with Beauvoir, Jean Pouillon, and Maurice Merleau-Ponty. The group was short-lived, but it solidified Sartre’s friendship with Merleau-Ponty, who, along with Aron, Jean Paulhan, and others, collaborated with Sartre and Beauvoir on their journal, *Les Temps Modernes*. As its 1945 mission statement made clear, *Les Temps Modernes* sought to “change man’s social condition and the conception he had of himself.” Its purpose was to militate “in favor of the person *and* the socialist revolution.”

Throughout the Cold War, Sartre’s relationship to communism was complicated. In 1948, he founded the *Rassemblement démocratique*

révolutionnaire, a group seeking to forge a “third way” between capitalism and communism that Sartre promptly quit after discovering that it was financed by American intelligence bodies. After the Korean War, he became a “fellow traveler” of the Communist Party. In a 1952 article titled “The Communists and Peace,” he denounced the “vicious rats of anticommunism” and embraced the Leninist vision of the party as vanguard of the revolutionary movement and as the objective expression of the proletariat. Around this time, Merleau-Ponty quit the editorial board of *Les Temps Modernes* because of Sartre’s “ultra-Bolshevik voluntarism.” Sartre’s embrace of the Communist Party was also at the origin of his split with fellow existentialist Albert Camus, with whom he had previously been close.

In the late 1950s, Sartre grew increasingly critical of the French Communist Party (PCF). In 1956, he denounced the brutal repression of the Hungarian Revolution and declared himself in favor of Algerian independence, which the PCF opposed. Yet, in 1960, Sartre published the *Critique of Dialectical Reason*, a massive treatise attempting to reconcile the Marxist revolutionary project with the existentialist emphasis on individual freedom. In the *Critique*, Sartre revised the analysis of freedom developed in *Being and Nothingness* by arguing that the individual could not become intentional or historically meaningful except as part of a collective, a “group-in-fusion.”

Throughout the 1960s and 1970s, Sartre moved to the left of the PCF. In 1964, he became the first laureate to refuse the Nobel Prize, doing so to avoid being “transformed into an institution.” In May 1968, he supported the French student revolt, once again breaking with the PCF. Sartre also enthusiastically embraced the Maoist students, whom he described as “moral revolutionaries,” as a quintessential group-in-fusion. Sartre’s closest interlocutors during the last years of his life were members of the Maoist group *La Gauche prolétarienne* (GP). When their newspaper, *La Cause du peuple*, threatened to disappear, Sartre and Beauvoir distributed it in the streets of Paris. In 1973, Sartre co-founded the left-leaning newspaper *Libération*. In 1974, Benny Lévy, the ex-director of the GP, became Sartre’s private secretary, a position he held until Sartre’s death. In April 1980, more than 50,000 people followed Sartre’s funeral procession in the streets of

Paris to mourn one of the most important and influential intellectuals of the twentieth century.

Schmitt, Carl

Schmitt, Carl

736

737

Schmitt, Carl

The German jurist Carl Schmitt (1888–1985) was one of the twentieth century's most influential and controversial conservative thinkers. Schmitt understood himself to live in period of profound crisis in which existing forms of authority were rapidly crumbling. This led him to focus his work on fundamental questions concerning the foundations of political order and the nature of legitimacy in constitutional and international law. Although best known as a trenchant critic of liberalism, his work centered on attempts to theorize effective forms of political authority capable of containing disorder. In *Political Theology* (1922), he famously defined sovereignty as the capacity to decide on the state of exception. Although this decision secured order, it located sovereign power above and beyond the norms of the existing legal system. In keeping with his claim that all modern concepts of state were secularized theological concepts, Schmitt compared this extra-legal sovereign decision with the religious miracle.

In his most widely read book, *The Concept of the Political* (1927), Schmitt argued that the political sphere was defined by the relationship between friend and enemy. As a result of humankind's conflictual nature, enmity was an inescapable part of human existence; the task of political order was to regulate it. In Schmitt's view, liberalism failed to recognize this antagonistic dimension of the political and attempted to displace political differences into the supposedly neutral spheres of morality and economics. During the 1920s, he developed an authoritarian theory of democracy that he hoped could revitalize a state weakened by liberal neutralizations. He

argued that insofar as democracy assumed the identity of ruler and ruled, it required homogeneity, and was therefore sharply at odds with liberal pluralism. Taking Benito Mussolini as an example, he claimed that the democratic will of the people was perfectly compatible with dictatorship. It was the desire to fuse strong state authority with a unified, homogeneous political community that drew Schmitt to join the National Socialists in 1933.

From the late 1930s, Schmitt focused on questions of international order. He attacked the growing influence of universal categories in international law, arguing that they were used by powerful states, notably the United States, to pursue their particular interests in the name of all. In his key late work, *The Nomos of the Earth* (1950), Schmitt claimed that all order rested on a unity of law and space that had unraveled with the collapse of Eurocentric world order. He regarded the core task of twentieth-century political thought to identify a new global spatial order, although his own proposals for a multipolar world order remained compromised by association with Nazi foreign policy.

It is particularly difficult to separate Schmitt's political thought from his entanglement in political affairs. During the final years of the Weimar Republic, his arguments for an authoritarian presidency that could unify a country divided between extremes of Left and Right found favor in the conservative circles around the Papen and Schleicher chancellorships and led him to defend the Reich government in the Constitutional Court. Although he initially opposed the National Socialists, Schmitt quickly aligned himself with the party after Hitler's appointment as chancellor in January 1933, accepting a number of prominent positions in academia and the legal establishment. Despite his enthusiastic attempts to provide theoretical legitimacy to Nazi policies, he had largely been marginalized by 1936. He nonetheless went on to theorize the expansion of the Nazi Reich as laying the grounds for a new system of international law based on a number of *Grossraume* ("large spaces") that would eclipse nation-states. In the wake of German defeat, these writings led to Schmitt's arrest and interrogation in Nuremberg by U.S. forces. Although he was released without charge, Schmitt was banned from holding academic posts in Germany and lived the remainder of his life as an ostracized figure in the

small town of his birth, from where he continued to publish and carry out extensive correspondence with leading European intellectuals.

Schmitt's work has had a wide and varied influence in a number of national contexts and across the political spectrum. His thought has been a key influence within conservative thought in postwar Germany and more broadly on the New Left and New Right in Europe since the 1960s, influencing thinkers as diverse as Giorgio Agamben, Alain de Benoist, Jürgen Habermas, and Gianfranco Miglio. Since the 1980s, Schmitt's impact on Anglophone debate has grown enormously, most notably during the last decade when his critique of liberal world order became a common reference point in international relations debates around the changing nature of sovereignty in a globalized world. The question of how to assess the relationship between his work and his Nazism has been a persistent source of controversy. Although some have maintained that Schmitt's involvement with the regime can be distinguished from his theoretical insights, others have argued that his choices were informed by a deep-seated anti-Semitism integral to his political thought.

Schumacher, Ernst Friedrich

Ernst Friedrich “Fritz” Schumacher (1911–77) is an interesting figure in political thought because of his unique blend of modern progressive concerns with a traditional conception of human nature. He is best known for his pioneering work in development economics, focusing on intermediate technologies and human-scale economies, and his concerns about overdependence on nonrenewable resources and pollution that he presented before the public in his magnum opus, *Small Is Beautiful: Economics as if People Mattered* (1973). His thoughts about economics and the environment were grounded in a traditionalist epistemology and conception of human nature that he articulated in *A Guide for the Perplexed* (1978). Schumacher’s vision of the economic problem as a problem of morality rather than of scarcity places him outside of the mainstream of the economics profession of his time as well as outside of the present approaches to political economy.

Schumacher was born in Bonn to a privileged German family. His grandfather had been involved in the German diplomatic service, holding posts in Latin and North America, and his father Herman served as a tutor to the children of Kaiser Wilhelm and later held an academic appointment to the economics faculty in Berlin where he worked on solving Germany’s interwar inflation crisis. Schumacher would follow his father’s interest in economics and benefited from several international educational opportunities including a Rhodes scholarship at Oxford and an opportunity to study banking at Columbia University in New York.

Schumacher's education would expose him to many of the leading economic minds and influential political actors of his time, including Joseph Schumpeter, H. Parker Willis, and perhaps most importantly, John Maynard Keynes. Temperamental, family, and political considerations pushed him toward a business career when he returned to Germany. Later, his distaste for the Hitler regime led him to a self-imposed exile in England.

With the outbreak of World War II, Schumacher was interned as an enemy alien. During his time of internment, he studied Karl Marx and Marxism but ultimately rejected ideologies of both the left and the right because he believed they neglected the spiritual dimensions of human existence. His social and political connections and intellectual work earned him a position with the Oxford Institute of Statistics. Theoretical work on a concept for an international clearing office brought him closer to John Maynard Keynes, while his reading of William Beveridge's *Full Employment in a Free Society* infused his economic thinking with a moral conscience.

After the war, Schumacher participated as an economic adviser to the British Control Commission. Coming from a democratic socialist perspective and as a supporter of the British Labour Party, he unsuccessfully lobbied Conrad Adenauer to socialize coal, steel, and iron. Later, when Britain nationalized coal in 1950, Schumacher would be appointed as chief economic adviser to the British National Coal Board, a job he would hold until 1970.

Schumacher's time at the National Coal Board would be intellectually fruitful. He became familiar with the works of G. I. Gurdjieff (1877–1949) and P. D. Ouspensky (1878–1947) and the search for spiritual evolution as well as the work of the British psychiatrist Maurice Nicoll (1884–1953), who attempted to reconcile the teachings of these thinkers' path for human development with Christianity. At this time, Schumacher deepened his knowledge of Buddhism through his acquaintance with Edward Conze (1904–79), an Anglo-German Buddhist and scholar. This spiritual education contributed to his embrace of a decentralized approach to economics when he visited Burma as economic adviser to the Burmese government in 1954. His paper emerging from this experience, "Economics in a Buddhist Country" (1955), echoing the economic position held by Mahatma Gandhi,

argued for an economy that was built on renewable resources and was sufficient to meet human needs while avoiding materialism. The common core that animated Gandhi's and a Buddhist approach to economic problems is that labor and the appropriate approach to it is an essential aspect of human spiritual evolution, and not merely effort that is to be avoided as a bad, as it was treated in Western economic theory. This spiritual approach to economics inspired Schumacher's conception of intermediate technology, a technology that was affordable, sustainable, and within the control of humans, as a tactical approach to economic development. In 1966, Schumacher founded the Intermediate Technology Development Group, a nongovernmental organization, to promote this humane and practical approach to technology.

After making a strong argument for an economy centered on Buddhist or other traditional values, Schumacher intensified his own study of the Western Christian heritage with particular attention on Thomism and neo-Thomist thinkers such as Etienne Gilson (1884–1978) and Jacques Maritain (1882–1973). Many would see a strong Catholic influence, particularly from Distributists like Hillaire Belloc (1870–1954) and G. K. Chesterton (1874–1936), on Schumacher's thought, although he did not formally join the Catholic Church until 1971.

Involvement with gardening and the Soil Association as well as serving on the board of Scott Bader and Company, a polymer manufacturer that emphasized collective ownership and limits on compensation to protect the lowest paid co-owners' rights, and continued work in development advising in Africa and Asia would add further practical experience informing Schumacher's theory. By 1973, Schumacher synthesized these diverse influences with the philosophical insights of economist and anarchist Leopold Kohr (1909–94) and radical social critic and philosopher Ivan Illich (1926–2002) into *Small Is Beautiful*.

Small Is Beautiful's core themes challenged the assumptions of mainstream economics and its neglect of the integrity of the natural environment and human personhood. The book questioned the wisdom of free trade, economic development, economies of scale, the imprudent use of technology, value-neutrality about human goals, growth for growth's sake,

and called for human scale endeavors that served higher purposes. The success of this book made Schumacher an international celebrity and opened doors for him to advocate for his ideas in the highest places including meetings with U.S. President Jimmy Carter and California Governor Jerry Brown. In 1995, *The Times Literary Supplement* named *Small Is Beautiful* as one of the 100 most influential books since World War II.

In 1977, he would publish *A Guide for the Perplexed* that would lay the ontological foundation for his political program. Schumacher affirmed an Aristotelian hierarchy of being, embraced a traditionalist approach to the great religious traditions as a source of this wisdom, and expressed concerns about modern science's ability to meaningfully engage the complex political problems confronting human beings. A better understanding of the interaction of Schumacher's practical actions and advocacy and its relationship to his ontology will be important to assess Schumacher's standing as a political thinker and the long-term salience of his thought.

Schumpeter, Joseph

Schumpeter, Joseph

739

740

Schumpeter, Joseph

Joseph Schumpeter is best known for two politically significant intellectual contributions: an elite competitive theory of democracy and a dynamic, heroic vision of capitalism. Born in Austria-Hungary in 1883, Schumpeter descended, on his father's side, from a family of provincial textile manufacturers. But after his father's death, Schumpeter's mother, through remarriage and relocation, positioned Schumpeter to enjoy a life in the aristocratic heart of the empire. He attended an elite secondary school and the University of Vienna, where he studied economics. He obtained academic appointments in Czernowitz and then Graz. During World War I, he wrote a series of memos advising a conservative audience on strategies to preserve the empire and its hybrid of aristocracy and capitalism. After the empire's collapse, he served an unproductive term as finance secretary in an Austrian coalition government. After a few years in banking, Schumpeter returned to academia, first in Bonn, and then at Harvard, where he crowned his intellectual career. In the United States, he continued to feel himself on the wrong side of historical developments, notably the New Deal, which represented to him many of the distressing tendencies that threatened capitalism. He died in 1950.

Schumpeter's best-known contribution to political science and political theory is his competitive elite theory of democracy. His motive in developing a theory of democracy derived from his well-known view that capitalist society was declining, to be replaced by democratic socialism. To understand what democratic-socialist society would look like—to

understand whether it would entail the democratic restructuring of new social realms, especially industry—Schumpeter felt the need to clarify the nature of democracy per se. His conclusions are crystallized in a definition: democracy as just an institutional arrangement in which teams of political elites compete with each other for mass electoral support and thus for power.

Schumpeter clears space for this definition of democracy by dismantling concepts of rule by the people, common good, or popular will—indeed, any theory treating democracy as an end in itself—as found in the work of figures such as Jean-Jacques Rousseau and John Stuart Mill. “The people,” he argued, is a concept too expandable to provide any real guidance. The hopelessness of many people agreeing on an idea of what is good bars us from calling any such idea “common.” And in the absence of any common good, it is pointless to imagine many diverse individuals converging on a shared will. In any case, Schumpeter argued, most ordinary individuals lack anything that could usefully be termed will. They are ill-informed about politics, unclear about how to achieve their wants, disturbingly persuadable, and subject to irrational impulses. Because majorities could agree on policies that no conscientious democrat could support, democracy had to be regarded only as a means, not as something valuable in itself.

The most important implication of this line of reasoning was that democracy rests not on the participation and deliberation of the masses but on the leadership of political elites. The only role for the people is to vote on which elite group will rule them until the next election. This conception of democracy, simultaneously denigrating the ability of most people to affect rational political change and granting a crucial role to society’s natural leaders, also ultimately portrayed democracy as static. It was a political method that could be contained within the stable, existing framework of society. A version of this view may be found in Schumpeter’s writings even decades before its best-known expression in *Capitalism, Socialism and Democracy*. But this elite conception actually existed in dialectical relation with another vision of democracy, often neglected, as more participatory and socially transformative. Arguably, then, Schumpeter’s elite competitive view represented his political program as

much as his scholarly outlook, his aspiration as much as the conclusion of any detached analysis.

For some, especially certain conservatives, the most significant of Schumpeter's contributions is not elite democracy but "creative destruction." In Schumpeter's view, the standard theory of the perfectly competitive market failed to capture capitalism's inherent dynamism. Unusually talented and energetic entrepreneurs, he said, introduced innovations that recurrently disturbed economic equilibrium, revolutionized production, and laid waste to firms devoted to old economic ways. Such "creative destruction" was crucial both to Schumpeter's attack on those who valorized equilibrium models and to an explanation of why capitalism's ups and downs were not in themselves threatening to the system.

Schumpeter's theory of democracy as elite competition has been for decades both a building block for many studies and a target for productive critical reflection. Meanwhile, creative destruction, while difficult to incorporate within mathematical economics, has deeply influenced studies of business, as well as political debates about capitalism. In both of these ways, Schumpeter's reputation seems likely to persist.

744

Scottish Enlightenment

Eighteenth-century Scotland enjoyed a rare share of intellectual vivacity. The term “Scottish Enlightenment” is often used to denote a philosophical period (from approximately the 1720s to the 1820s) forming a part of the intellectual foundation of Western modernity. Although the literary flourish of eighteenth-century Scotland is universally admired, the concept of the Scottish Enlightenment and whether there were one or many Enlightenments remain contested issues. The term “Scottish Enlightenment” was not used by eighteenth-century contemporaries, but it was first coined at the turn of the twentieth century. The existence, content, and relevance of the Scottish Enlightenment have been sources of growing debate since the 1960s. This entry will outline the Scottish Enlightenment by considering its nature and thinkers, by framing its historical and intellectual context, by drafting its main moral and political features, and finally by taking into account its legacy as a platform for Western modernity.

Around the 1750s, the small Scottish population (only about 1.3 million inhabitants) was avant-garde in many discussions that have since shaped the modern intellectual atmosphere with regard to natural science, theology, philosophy, and especially conceptions of civil society. Eighteenth-century Scotland witnessed the emergence of the well-known intellectual giants Francis Hutcheson, David Hume, and Adam Smith. This period is perhaps most famous for elaborate projects aiming to outline the “Science of Man” and ranging from epistemological questions of human understanding to

conclusions about aesthetics, morals, and politics (e.g., Hume, *Treatise of Human Nature*, 1739–40). In political philosophy, the Scots of the Enlightenment period were the first to underscore concretely the relevance of commerce to our historical understanding of the emergence of civil society.

The Scottish Enlightenment can also be used as a term denoting an intellectual movement that was Whig and liberal-minded in politics and moderate Presbyterian in religion. Although there are many crucial differences in moral and political thought of the eighteenth-century Scots, the Scottish Enlightenment was a unified project because it had a common aim: the progress of humanity. It was a movement founded at the University and the Church in all the major university towns of eighteenth-century Scotland: Edinburgh, Glasgow, St Andrews, and Aberdeen. It formed a moderate culture of clergymen, professors, and laymen striving for cosmopolitan universality. It was a culture that also took root in different clubs and societies, founded for the purpose of promoting the progress of humanity. The Scottish Enlightenment also had an idiosyncratically practical side to it, exemplified in different reform attempts in the Highlands that at the time were considered uncivilized.

The authors of the Scottish Enlightenment worked closely with a network of patrons and book publishers in Edinburgh, Glasgow, and London, which was crucial in making an actual intellectual impact. A list of the characters of the Scottish Enlightenment includes Francis Hutcheson, David Hume, Adam Smith, Adam Ferguson, William Robertson, Henry Home, John Millar, Thomas Reid, Hugh Blair, Alexander Gerard, George Campbell, Joseph Black, William Cullen, Allan Ramsay, Lord Monboddo, Alexander Carlyle, John Gregory, Sir David Dalrymple, James Hutton, Robert Adam, James Beattie, Henry Mackenzie, Dugald Stewart, and others.

Context

The main historical context for the Scottish Enlightenment was the Act of Union of 1707, which formed Great Britain and marked the dissolution of the Scottish parliament. Scotland in the early eighteenth century was a relatively poor and backward country, although it had had its share of

intellectual cultivation in prior centuries. Any claims that the intellectual vivacity of the Scottish Enlightenment emerged solely because of the Union are unfounded. England, Scotland, and Wales had not only common denominators facilitating the Union (geography, language, and Protestant religion) but also differences (e.g., the English legal system was based on the common law tradition, whereas the Scots had followed the central European tradition of founding their legal system on Roman law). The eighteenth-century political framework was dominated by considerations of the European state system, and French absolutist attempts at universal monarchy largely shaped the intellectual atmosphere in Britain. A foundational question for the Scottish Enlightenment was the question of a commercial empire and Scotland's interest in securing its overseas trade by being a part of Great Britain. Eighteenth-century Scotland also witnessed rebellions in the form of Jacobite risings in 1715 and 1745 that threatened the Union.

The Scottish Enlightenment can be seen as a catalyst for many of the most relevant seventeenth-century intellectual developments, especially in the tradition of natural law. The eighteenth-century Scots also read their share of French moralist views alongside Thomas Hobbes's conception of the state of nature, John Locke's taxonomy of mind, and other seventeenth-century intellectual achievements. In accordance with Locke's empirical principles, perhaps the two most relevant authors shaping the ideas of the Scottish Enlightenment were Anthony Ashley Cooper, the third Earl of Shaftesbury, and the Dutch-born controversialist Bernard Mandeville. Shaftesbury's ideas of sociability had a profound impact on the moderate culture of eighteenth-century Scotland with regard to humankind's capacity for benevolence, whereas Mandeville's more realistic outlook emphasized egoistic tendencies in human actions. The dichotomy between these thinkers also sparked debates dividing the Scottish Enlightenment into different camps.

Perhaps the greatest impact of the Scottish Enlightenment on Western thought has been the idea that morality is founded on sentiment rather than on reason, an idea developed mainly by Hutcheson and accepted by Hume, Smith, and others. This development can be seen as part of the empirical tradition in which the history of science also plays a crucial role and in

which the significance of Francis Bacon, Robert Boyle, and Locke is evident.

Moral and Political Thought

One characteristic feature of eighteenth-century thought is that moral and political spheres overlap. Similarly, eighteenth-century economic ideas must be considered part of political economy because economic theory as such did not yet exist. In the Scottish Enlightenment, everything that was part of moral theory was also considered part of political thought and vice versa. This stemmed from the empirical background of the Scottish Enlightenment, which began by first defining human understanding and human nature, and from this perspective aimed toward the common good, policy making, and the generation of wealth by managing the nation's resources.

The main moral dispute of the Scottish Enlightenment concerned passions. Whereas previous Christian traditions taught that morality required passions to be controlled and suppressed, eighteenth-century Europe saw a growing number of authors suggesting that even vice could sometimes be publicly beneficial and that the passions of pride and self-interest need not be repressed, only redirected so that they prove useful. This was a foundational matter of debate in the Scottish Enlightenment, which generated various fruitful contemporary accounts of the historical development of civil society. In particular, the question of luxurious consumption beyond one's basic needs divided opinions that varied from claims of public and moral corruption to sophisticated arguments of public utility. One of the main works on this topic is Adam Ferguson's *Essay on the History of Civil Society* (1767).

Hand in hand with the question of the role of self-interest and pride in civil society went the question of moral motivation: Are people universally benevolent by nature? Many authors of the Scottish Enlightenment believed that human beings have a moral sense that can, like vision, be distorted but that also serves as a foundation for moral motivation. Some authors, most notably Hume, denied the claim about universal benevolence by emphasizing the role of conventions in social formation. Debates about

hedonism and the role of utility in civil society were common in eighteenth-century Scotland, as exemplified in Smith's *Theory of Moral Sentiments* (1759).

Perhaps the most important moral and political concept of the Scottish Enlightenment was justice. Questions of the origin of property and rightful ownership drew largely from natural law, which had a strong institutional basis in eighteenth-century Scotland. Most authors criticized seventeenth-century contract theories, and Scottish historical writing developed together with discussions of property, justice, political obligation, and the legitimacy of government. As an outcome, the social theory of the Scottish Enlightenment was rooted in historical understanding of the development of civil society. The question of justice was also a moral question, which extended the discussion of the natural and artificial sociability of humankind. Although Hume is best known today for his epistemological conclusions, his reputation in the eighteenth century relied almost solely on his *Essays*, *Political Discourses*, and voluminous *History of England*. Hume's views on justice (and causation) were attacked particularly by commonsense philosopher Thomas Reid.

Alongside justice, another critical discussion about conventions concerned politeness. Politeness was a crucial concept in the Scottish Enlightenment mainly based on Shaftesbury's ideas of virtuous sociability, which provided a framework for civility within the boundaries of virtue, in contrast to Orthodox Calvinism's strict views on sin and the continental tradition of court civility that emphasized external attributes of courtesy. Hume, following Mandeville, claimed that these views based on natural sociability were contrary to human nature and thus untenable. However, politeness for Hume was just as important a concept as it was for the followers of Shaftesbury. The difference was that Hume claimed that politeness was an external custom and an artificial virtue. The opinions of the Scottish Enlightenment were thus also split concerning politeness.

Despite their differences, eighteenth-century Scottish authors had a common aim in politics: global civilization. Interestingly, the thinkers of the Scottish Enlightenment approached interstate relations in Europe from the perspective of human nature, which gave their arguments a scope of

universality. At the same time, their political views varied from the political radicalism of Hutcheson to more conservative views expressed by Hume, Smith, and Dugald Stewart after the French Revolution.

The foundational moral and political issue of the Scottish Enlightenment was commerce. Although Adam Smith had predecessors, he was the first to identify explicitly the relevance of the unintended, beneficial consequences of self-interested actions in the marketplace. Smith also emphasized that comparison in the development of a civil society shows that the poor of commercial society are better off than the rich of previous stages (assessments were made of Europe's "civilized monarchies" and Native American tribal communities). This was not an argument to be ignored, and when combined with growing attempts to break free from mercantilism by emphasizing the role of the division of labor, productivity, and how to secure the advantages of rich countries from countries underselling their products, these ideas of *homo economicus*, as outlined in Smith's *An Inquiry into the Nature and Causes of the Wealth of Nations* (1776), began to form a platform for Western modernity.

Although commercial society was considered the most advanced state of human sociability, questions about the imperfections of the market, instead of the full-fledged promotion of laissez-faire liberalism, dominated discussions of political economy. One such question was whether Great Britain should forfeit its overseas colonies and grant independence to the United States. This does not mean, however, that Smith and others would have been supporters of uncontrolled free trade and global shareholding without interference by local governments. Smith also had a genuine interest in the condition of the poor and ordinary laborers. Nor did this entail ideas of social reform or redistribution of wealth as a state-run strategy. Smith did, however, provide a seed for the idea of universal education of the poor.

Legacy

The cosmopolitan character of eighteenth-century Scotland involved a relationship with other European countries sharing influences with French eighteenth-century thought in particular as well as an Atlantic dimension

through the work of John Witherspoon and others toward the end of the Scottish Enlightenment. The Enlightenment period cannot be described as a teleological progress of reason and steady decline of religion. Questions regarding the political organization of the church, the natural history of religion, and matters of faith were an integral part of the Scottish Enlightenment. It is therefore only natural that religious toleration was one of the main issues of the era.

As the political framework changed during the eighteenth century, and wars turned out to be too expensive for individual states to handle, so the emphasis of the Scottish Enlightenment shifted from debates about moral sense and natural sociability to discussions of the European state system and the commercial empire of the sea. Modern state structures began to emerge, taxation slowly became more regular, the banking industry was established, and questions of paper money and public debt were fervently debated. This had a crucial impact on the Scottish Enlightenment, so it is understandable that Adam Smith, for example, who was first and foremost a moral philosopher, is best known as the father of classical economics.

Political economy was an integral part of the legacy of the Scottish Enlightenment for Western modernity, but equally important were questions of constitutional balance and what kind of role a sovereign should have in a mixed form of government in which political power is shared between parliament and a monarch. Authors of the Scottish Enlightenment were amply constructing their political views on the concepts of equity and equality; at the same time, democracy was not part of their common vocabulary. In short, the Scottish Enlightenment formed a platform for Western modernity, but it was not the world we inhabit today.

Separation of Powers

Separation of powers

744

745

Separation of Powers

The separation and allocation to different institutions of the main powers of government—legislative, executive, and judicial—is one of the most prominent features of modern constitutionalism. It is designed to reduce the risk of tyranny and to promote efficiency through specialization.

In medieval times, governmental powers were often concentrated in a monarch or emperor. In England, for example, the king was simultaneously the chief lawmaker, the head of the executive government, and the supreme judge, even though he often delegated his powers to inferior clerks and judges whom he appointed and could dismiss at will.

As the unwritten English constitution developed, it took on the features of “mixed government,” with sovereign power exercised jointly in parliament by the monarch, aristocracy, and representatives of the commoners. Parliament was the supreme legislature and the nation’s highest court, and eventually, it acquired power over the executive branch. According to the theory of mixed government, the main alternative models of government—monarchy, aristocracy, and democracy—each possessed distinctive virtues and vices, so that a judicious combination of all three could hope to enjoy their virtues while suppressing their vices. This theory was based on the writings of Aristotle and the practices of Republican Rome, which involved power sharing by the aristocracy and representatives of the plebeians.

The theory of the separation of powers differs from that of mixed government. Even today, the unwritten British constitution does not formally incorporate a separation of powers. Under the Westminster system of responsible government, the executive branch is regarded as responsible to parliament, and it is controlled by those members of parliament who enjoy majority support in the Lower House. On the other hand, a separation of judicial power, although not constitutionally entrenched, is upheld by constitutional conventions, which are customary practices generally regarded as obligatory although not legally enforceable. These conventions are underpinned by the Bill of Rights (1688), a statute providing that judges cannot be dismissed by the monarch but only by parliament for proved misbehavior or incapacity.

Influenced both by Iroquois and other native confederacies (Grinde and Johansen 1991) and by the French political theorist Baron de Montesquieu, the framers of the U.S. Constitution maintained that the concentration of all governmental powers in a single institution, even if elected, “may justly be pronounced the very definition of tyranny” (James Madison, *The Federalist*, #301). They devised a written Constitution in which those powers were allocated to separate institutions: the legislative power to Congress, the executive power to the president, and the judicial power to the Supreme Court and other federal courts established by Congress. But this separation was deliberately incomplete. To enable each branch to act as a “check and balance” on the activities of the others, each was given some powers with respect to the others. Thus, legislation can be vetoed by the president; the president and Supreme Court judges can be impeached by Congress; Supreme Court judges are nominated by the president but must be confirmed by the Senate; and so on.

The separation of judicial power from the political branches of government is the most important aspect of the doctrine. This feature requires judges to enjoy independence in exercising their judgments. There would be no point in vesting judicial power in judges who could be forced or induced to act at the behest of the political branches. In most modern constitutions, therefore, judges’ tenure and remuneration are insulated from political interference.

It has proved extremely difficult in practice to delineate the traditional distinctions among the various powers of government, especially as those powers have evolved and multiplied since the end of the eighteenth century. In some legal systems, a large and complex body of laws has been developed that attempts to provide criteria for distinguishing each power from the others. Many critics argue that this task is impossible because the multifarious and often discretionary powers of the modern administrative state simply cannot be shoe-horned into the traditional three categories. Some of them propose alternative methods of classifying governmental powers or the main branches of government. For example, it has been suggested that the increasing number of unelected and independent administrative agencies, such as central banks, economic regulators, and auditors, should be recognized as constituting a fourth branch of government that acts in a politically impartial fashion on the basis of specialized knowledge and empirical inquiry. It has also been argued that an “integrity branch” of government, to investigate and prosecute corruption and abuse of power in any of the other branches, is desirable for constitutionalism to be fully secure. An integrity branch would take over some of the investigatory and prosecutorial powers currently exercised within the executive and judicial branches.

747

Sidgwick, Henry

An outstanding English moral philosopher of the late Victorian era, Henry Sidgwick was born on May 31, 1838, in Skipton, Yorkshire, and had a brilliant academic career at Rugby school and Trinity College, Cambridge, where he excelled in both classics and mathematics. As a young man, and member of the famous discussion society known as the Cambridge Apostles, he developed religious doubts and an interest in the utilitarianism of John Stuart Mill and Jeremy Bentham, which held that the ultimate normative standard was the greatest happiness of the greatest number. He quickly became a devoted academic liberal and educational reformer, championing a Millian form of feminism and challenging the academic status quo on many fronts, from the unfair exclusion of women, to the overemphasis on classics, to the demands for religious conformity. In 1869, he nearly ended his academic career at Cambridge when he resigned his fellowship rather than swear to the Thirty-Nine Articles of the Church of England, as was then required. Fortunately, he was able to continue his academic work as a lecturer, and after the elimination of the subscription requirements, he again became a fellow of Trinity College, and later, in 1883, the Knightbridge Professor of Moral Philosophy. In 1876, he married Eleanor Mildred Balfour, whose brother Arthur would become prime minister. Together they devoted an enormous amount of time to the cause of higher education for women, helping to found Newnham College, Cambridge, one of the first women's colleges in England. They also worked religiously in parapsychology and were mainstays of the British Society for

Psychical Research, although their many investigations of paranormal phenomena were largely disappointing. But Sidgwick made important contributions in many fields, particularly ethics, political theory, and political economy, where he came to be regarded as a co-founder, with Alfred Marshall, of the “Cambridge School” of economics. He regularly advised the British government on economic and educational matters, and he was a well-known opponent of home rule for Ireland.

Sidgwick achieved lasting fame with the publication of his masterpiece, *The Methods of Ethics* (first edition 1874), a work that is perhaps even more widely cited by philosophers today than it was at the time of Sidgwick’s death, on August 28, 1900. The *Methods* provides a lucid expression of Sidgwick’s preferred ethical and political method—namely, classical utilitarianism—but it is a complex, heavily qualified work that often departs from the positions of Sidgwick’s great utilitarian predecessors.

Thus, Sidgwick was more keenly aware of the basic conflict between utilitarianism and rational egoism—taking one’s own greatest happiness as the ultimate standard, rather than the happiness of all—and of the need for firmer epistemological foundations for utilitarianism, to defend it as rationally superior to egoism and other alternatives, something he was not sure he could provide. He developed a sophisticated, fallibilistic form of philosophical intuitionism, hoping to yield a cognitive basis for normative claims with a set of clear, consistent, coherent, and consensual fundamental intuitions. He did not claim, however, to have succeeded in his efforts and worried that only a theological postulate could effectively overcome “the dualism of the practical reason,” reconciling pursuit of one’s own happiness with the happiness of the whole—a theological postulate that he could not compellingly defend, even by resort to parapsychology.

The *Methods* was only the first of several major treatises that Sidgwick published during his lifetime, the others being *The Principles of Political Economy* (first edition 1883), and *The Elements of Politics* (first edition 1891). Important posthumously published works include *The Development of European Polity* (1903). These books contain Sidgwick’s more extensive treatments of the political implications of utilitarianism, the nature of justice

(both national and global), international law, economic development, political evolution, jurisprudence, and more.

In these works, however, Sidgwick admittedly simply assumes utilitarianism, deeming his favored view more in line with the general tendency of educated thought. He elaborates a subtle, complex, cautiously progressive vision of the growth of more liberal democratic forms of political organization and more cosmopolitan forms of citizenship, with cooperation and confederation among the “advanced” nations reducing the risk of war. And although he takes his point of departure from a principle of nonpaternalistic individualism, as a baseline secondary principle for domestic economic and political organization, he so heavily and complexly qualifies any such approach that commentators have varied wildly in their assessment of just where he falls on a Right–Left spectrum. If he appears to have opened the door for the New Liberals’ defense of the welfare state, he was also anxious, in culturally conservative ways, about democratic and labor strife and far too uncritical of the expansion of the British empire. Indeed, his work betrays more overt racism and orientalism than does that of Bentham and Mill, even if some think him a superior economist and philosopher.

Sieyès, Emmanuel Joseph

Sieyès, Emmanuel Joseph

747

748

Sieyès, Emmanuel Joseph

More commonly known as the Abbé Sieyès (1748–1836), Sieyès was a French clergyman and political writer and, in the latter capacity, one of the chief political theorists of the French Revolution. He later played a prominent role in the French Consulate and first French Empire, but it was his 1789 pamphlet *What Is the Third Estate?* for which he is most famous. The pamphlet contained the revolutionary idea that the common people, the Third Estate, were the politically sovereign nation. This idea became the ideological impulse behind the radical democratic course of the revolution, and it continued to influence the contours of democratic politics in subsequent centuries.

After a seminary education, Sieyès entered the priesthood and was appointed to the position of canon of the Cathedral of Chartres. Frustrated at his lack of advancement, Sieyès witnessed at firsthand the power and privilege of the nobility in the institutions of church and state, and it was from this vantage point that he developed a critique of aristocratic political power. Sieyès was renowned for his intellectual ability, and he embraced new philosophical and scientific principles and ideas, derived from a rigorous reading of Enlightenment thinkers such as John Locke and François Quesnay. Sieyès's rationalism and worldliness were at odds with the piety expected of the clergy, and in due course, he demonstrated the extent to which he rejected traditional institutions and structures.

Sieyès's career was transformed by the financial crisis of the French state. The inability of King Louis XVI to impose new forms of taxation on the nobility led in September 1788 to the king calling the ancient Estates-General to meet in May 1789. New taxes had to be approved by the Estates-General, but with the country in turmoil, the calling of that ancient body of representatives of the three estates of clergy, nobility, and commons threatened to unleash an avalanche of grievances. In the months before the Estates-General met, the Paris Parliament directed that the two estates of nobility and clergy would meet separately, each with the same number of delegates, and each with a single vote. In this way, the clergy and nobility would always be able to outvote the Third Estate and, thus, stifle any reform.

This was the political context in which Sieyès published *What Is the Third Estate?* In the pamphlet, Sieyès attacked the old regime and argued that the privileged nobility and clergy preyed financially on an overburdened and prostrate bourgeoisie. Sieyès viewed the Third Estate as the primary medium of public service engaged in productive work that generated and produced services and goods for the whole of society. In practical terms, Sieyès argued that the Third Estate, the common people of France, constituted the nation, a viewpoint with immensely important implications for the future of democratic, reformist politics. For Sieyès, the Third Estate should entirely replace the other two estates and assume the government of the country.

On May 5, 1789, the Estates-General met for the first time since 1614. Despite doubling the representation of the Third Estate, voting by estates meant that the Third Estate could still be outvoted. On June 17, Third Estate deputies, supported by a number of deputies from the First and Second estates, rejected this proposal and declared they were not simply the Third Estate of the Estates-General but a sovereign body in their own right. They proceeded to meet on their own in a body that eventually evolved into a national assembly. Influenced by the theoretical model and practical political strategy provided by Sieyès, Third Estate deputies, by their actions, identified the common people as the sovereign political authority.

Sieyès was elected to the Estates-General, where ironically his clerical status made him part of the First Estate, but his position did not shake his conviction that political privilege and patronage should be swept away. Sieyès continued to be influential in the early years of the revolution, expounding on theories of national and popular sovereignty, and representation, and justifying a suffrage limited to male property-owners, who were termed “active” citizens. He drafted the Declaration of the Rights of Man and Citizen, which was adopted by the Constituent Assembly on August 26, 1789 and was embodied in the French Constitution of 1791 as a preamble. As a member of the Convention, he voted for the execution of Louis XVI.

With the descent of the French Revolution later in the decade into Napoleonic dictatorship and Empire, it is clear that ultimately Sieyès failed to establish the radical and democratic bourgeois revolution he hoped for. Nevertheless, his influence on events was immense, for *What Is the Third Estate?* not only provided a critique of the old regime but also contained a powerful theoretical model providing ideas that shaped the course of the French Revolution. It encapsulated popular fury at aristocratic and clerical privilege, and it established a radical theory of popular sovereignty allied to revolutionary political strategy.

Smith, Adam

Smith, Adam

748

749

Smith, Adam

Adam Smith (1723–90) was a leading figure of the intellectual movement of eighteenth-century Scotland known as the Scottish Enlightenment. He is famous today as the author of *The Wealth of Nations* (1776) and the “father” of modern capitalism, but he was perhaps best known in his lifetime as a moral philosopher.

Born in the small port town of Kirkcaldy, Scotland, Smith studied at the University of Glasgow under the eminent philosopher Francis Hutcheson. After graduating, he spent six years at Balliol College, Oxford, where he found his teachers rather uninspiring and spent much of his time in self-instruction. He obtained a position teaching logic at the University of Glasgow in 1751, and a year later was appointed chair of moral philosophy there, taking over Hutcheson’s old position. Smith’s first book, *The Theory of Moral Sentiments* (1759), was enthusiastically received throughout Europe. In 1763, as a result of his newfound prominence, he was offered a generous salary and lifelong pension to leave Glasgow and become the tutor of the young Duke of Buccleuch. The pair spent two and a half years traveling on the continent, where Smith met a number of prominent *philosophes* and *économistes* in Paris and Geneva. Upon their return to Britain in 1766, Smith, a lifelong bachelor, went to Kirkcaldy to stay with his elderly mother. He had been working intermittently on the material that was to become *The Wealth of Nations* at least since the early 1760s, and he began to delve into it in earnest there. He moved to London in 1773 and added to his already considerable reputation when *The Wealth of Nations*

was finally published and became a resounding success. Soon afterward, he was appointed commissioner of customs for Scotland, a job that he held during the last decade of his life, in Edinburgh.

Like his close friend, the philosopher David Hume, Smith argued that moral judgments are derived not from reason but from sentiment, above all from feelings of approval and disapproval. According to his moral theory, an action or character trait can be considered virtuous if an “impartial spectator”—that is, a bystander who is disinterested and fully informed—would approve of that action or trait. Such a spectator’s sentiments would naturally be influenced by the norms of his or her society, thus, making the content of morality “relative” to some degree. In Smith’s view, a society’s moral norms arise spontaneously over time through the actions and judgments of individuals who do not consciously set out to produce those norms, similar to the way a flourishing economy arises spontaneously over time through the actions of individuals who do not consciously set out to promote the society’s welfare. Smith was, as his current reputation would suggest, a firm defender of commercial society and free trade, but his defense was a nuanced and historically informed one. He frequently highlighted the potential dangers of uncontrolled commerce, such as the tendency of individuals to undergo nearly endless toil and anxiety in the pursuit of frivolous luxuries, the proclivity of merchants to procure monopolies that harm ordinary consumers, and the way an excessive division of labor can weaken the intellect and the courage of workers. For these reasons, Smith emphasized the need for a strong central government to enforce rules of fair play and to promote education, especially among the poor. Hence, although he opposed most governmental attempts to direct individuals in the use of their labor or capital, he was no opponent of government in general. Indeed, he devoted a considerable portion of Book V of *The Wealth of Nations* to arguing that the government and its functions must *expand* as society progresses. Although he certainly welcomed the prosperity that commerce made possible, Smith indicated in Book III of *The Wealth of Nations* that the *greatest* advantage of commercial society is that it helped to eliminate the kinds of insecurity and personal dependence that dominated most precommercial societies. In other words, Smith’s deepest reason for defending commercial society was not that it provides people with more material goods but that it provides them with more freedom.

Social Democracy

Social democracy

749

753

Social Democracy

Today the term *social democracy* is commonly associated with support for the welfare state, a mixed economy, cooperation among social classes, and reform rather than revolution. But social democracy is a work in progress, defined more by the policies its leaders and spokespersons have adopted in countries where they have governed than by systematic philosophical reflections. It thus remains a practice in search of an appropriate theory.

Intellectual History of Social Democracy

Social democracy has a twofold philosophical origin: the classical theory of liberal democracy and socialist thought since about 1850. Initially in conflict, these two sources eventually have proven to be compatible—even mutually reinforcing. The starting point of liberalism has always been the assertion that human beings possess rights as such, and not because they belong to any specific class, religion, or ethnic group. Underlying that notion of universal rights is the intuition that human beings should be free to choose their life plans and the governments under which they will live. By the late nineteenth century, autonomy and self-development had become the watchwords of liberal political thought. Yet for centuries the conception of freedom latent in liberalism had only limited practical consequences for nonelites. Liberal theorists thought that formal guarantees of rights plus representative government would be enough to ensure liberty and self-development for all. It did not seem to them necessary to go further, for

example, by instituting universal suffrage or tolerating radical dissent, much less adopting social welfare measures.

Socialism's most influential thinker, Karl Marx, rejected the liberal notion of rights as an artifact of bourgeois society to be jettisoned once class antagonisms had been eliminated. His critique developed two related insights. First, Marx insisted that the legal recognition of formal equality would not necessarily affect the character of a person's concrete existence. For that to occur, the material circumstances of life would have to change—the character of work, patterns of ownership, and so on. Second, abolishing the capitalist system of production would finally enable human beings to make their own history with “will and consciousness” by acts of collective choice, whereas previously they had submitted to blind necessity—either the forces of nature or the intensifying cycles of boom and bust typical of capitalist economies. Marx believed that human liberation and genuine self-determination could be achieved only after the working classes had seized the means of production. In the century after Marx's death, social democrats would gradually abandon the commitment to socialism (public ownership of industry) but not the goals of freedom and self-development or collective decision making about the organization of society.

Elements of the Modern Social-Democratic Synthesis

The first political parties to call themselves socialist or social democratic frequently refused to cooperate with other parties or participate in parliamentary governments on the grounds that social democrats should await the inevitable self-destruction of capitalism. They offered few concrete proposals for socioeconomic reform except the program of nationalizing industry. But by the early twentieth century, dissidents had begun to rethink the old Marxist orthodoxy.

For example, Eduard Bernstein in Germany came to regard social democracy as a more advanced version of classical liberalism, not as the latter's antithesis. Moreover, he realized that capitalism had developed and adapted since Marx's era, generating greater wealth and a more complex

class system than the crude two-class model that orthodox Marxism had taken for granted. Accordingly, he advocated cooperation with some “bourgeois” political parties, a more evolutionary path to socialism, and a commitment to active reform designed to bring concrete benefits to workers. He consistently opposed a policy of passivity and disengagement justified by some socialists (e.g., Karl Kautsky) on the grounds that capitalism would collapse of its own weight. But he also clashed with Rosa Luxemburg and other militants who believed that capitalism could be toppled only by revolution. Eventually, the social-democratic movement split in most countries. The revolutionary wing allied itself with the Bolshevik movement in Russia and took the name “communist,” while the more gradualist and reform-oriented factions or parties retained the name “social democratic.”

Unlike Bernstein, an important politician in the German Social Democratic Party, Hermann Heller developed a proto-theory of social democracy from a liberal rather than a socialist viewpoint. Heller, a legal scholar, sought to extend the idea of the rule of law beyond its usual procedural meaning to cover social and economic conditions as well. Alarmed by the class tensions that beset German politics in the 1920s, he thought a “material rule of law” was needed that would ensure the fair distribution of resources and opportunities by consulting and including all relevant stakeholders in political deliberations. In fact, he urged that reshaping social and economic conditions according to the principles of justice would ultimately lead to a higher degree of social homogeneity, by which he meant a political culture in which mutual trust and respect would eventually supplant class conflict and violence. In short, society would be dominated by a “we” feeling rather than by an “us versus them” mentality. To put his idea in more modern terms, he realized that social democracy could contribute to social stability and the accumulation of “social capital.”

Another prominent figure in the evolution of social democracy, T. H. Marshall, argued that the three key elements of basic human rights, civic, political, and social, had gotten out of phase by the early nineteenth century. Liberal regimes in England and elsewhere sought to institute legal and eventually even political equality as a matter of civic right. To do so, they had to dismantle many of the social protections (for example, fair

compensation for work) that ordinary Englishmen had previously enjoyed. The liberal establishment failed to realize that many citizens could not make full use of these newly conferred rights as long as they were denied such elementary socioeconomic benefits as a decent wage, education, and some leisure time. Only after World War II, Marshall claimed, did the notion of “social citizenship” come to mesh with liberalism’s other commitments. The full enjoyment of civic and political rights could be guaranteed only if citizens also possessed the social rights to a decent standard of living. In the postwar social-democratic welfare state, that conjunction of civic and political with social rights finally came to fruition, most notably, in the Scandinavian countries.

Furthermore, most social-democratic parties eventually fell under the influence of British economist John Maynard Keynes, who early in the Great Depression concluded that public ownership of the means of production—old-fashioned socialism—was not necessary to cure the ills of capitalism. It would be enough to pursue more enlightened economic policies (especially deficit spending) to smooth out capitalism’s characteristic boom-and-bust cycle and inaugurate an era of lasting prosperity. Keynes’s message dovetailed well with the arguments made decades earlier by social-democratic reformers like Bernstein, Jean Jaurès in France, and Hjalmar Branting in Sweden: Social democracy needed to offer workers practical reforms with concrete, palpable benefits.

Social Democracy Today

In the postwar era, the reform strand within socialist and social-democratic parties gradually won out. Experience during the 1920s and 1930s had shown that social-democratic parties needed to take a stand in favor of liberal rights and the rule of law. Where they did not, authoritarian and totalitarian movements triumphed and liquidated the social-democratic parties along with their leaders. Moreover, Keynesian theory plus the lessons of actual governance suggested that social-democratic parties could attain many of their objectives without opting for socialist-style nationalization of the means of production. In one country after another, socialist and social-democratic parties adopted programs of social welfare, steeply graduated taxation, and limited nationalization of industry. But

theory had not yet caught up with practice. Social democrats needed to reflect on their own changing ideologies, policies, and aims. The need for a systematic review of policy and its justifications became even more evident by the 1980s, for several reasons. First, the trend toward globalization undercut the nation-state's ability to ensure social welfare and greater equality. Second, new movements for gender equality, environmental sustainability, and cultural diversity were not easily accommodated within older social-democratic intellectual assumptions of social homogeneity, the primacy of heavy industry, and the one-earner family. Finally, the resurgence of free market or "neoliberal" ideas and policies in some countries, (e.g., what became known as Reaganomics in the United States and Thatcherism in Britain) challenged social-democratic theorists to redefine their core principles.

One strand of theorizing about the movement's goals and prospects in the late twentieth century focused on the conditions for its success in countries in which social-democratic parties actually have held or shared power for significant stretches. Scandinavian countries fit this description best, especially Sweden, where the Swedish Social Democratic Workers' Party (SAP) governed during most of the post-World War II era. Empirically oriented studies explain the movement's successes in light of the unusual historical conditions that prevailed in Scandinavia, such as the fragmentation of the political right wing and the early willingness of the SAP to join in coalitions with "bourgeois" parties, in contrast to social democrats' aloofness in Germany, France, and elsewhere. By now, the Scandinavian experience, with its generous and universalistic patterns of social provision, has tended to convince most casual observers that social democracy is in fact equivalent to the welfare state. But even there, social-democratic theorists have had to adapt. They have incorporated a great deal of the ecological agenda into their program, have opted for broad participation of ordinary citizens in political decision making, and have undertaken vigorous efforts to overcome class bias in the school system. To some extent, the Scandinavian pattern simply *is* what social democracy means. But some theorists have attempted a more systematic approach, reasoning that social democracy needs a grounding that can synthesize empirical and philosophical points of view.

The modern normative theory of social democracy begins from the premise that it is above all a variety of *democracy*. Hence, whatever the requirements for full and complete democracy may be (and these will certainly include the basic rights recognized by liberalism), social democracy must incorporate them into its program. But contemporary social democracy also retains the insight articulated long before by Marx and taken up by Heller, Marshall, and others: Political democracy and civic equality are not enough; democracy must be made “social” in the sense that it reshapes and equalizes human relationships in the world of work, education, and income distribution.

One effort to rethink the meaning of social democracy for our time has been undertaken by British sociologist Anthony Giddens. Concerned by the popularity of neoliberal policies in England, Giddens has concluded that social democracy must find a “third way” between traditional socialism, with its emphasis on state control of important sectors of the economy, and untrammelled capitalism in the mold of Margaret Thatcher and Ronald Reagan. He believes that social democrats should acknowledge the central role of the market in generating income and employment and in providing economic incentives, an increasing concern in European welfare-state economies of the twenty-first century. Furthermore, he advocates an “active civil society” in which some of the tasks that the state might once have assumed in social-democratic theory would be delegated to civic associations in the way recommended long ago by Alexis de Tocqueville. The point would be to arrest the decline of citizenship that seems to be affecting most modern societies and disassociate social democracy from centralization and statism.

Another approach, taken by Sheri Berman, locates the distinctiveness of social democracy in two key principles uncovered in the course of its development: the primacy of politics and communitarianism. Social-democratic thinkers and political leaders gradually freed their movement from residual orthodox Marxist elements (e.g., the supposed inevitability of communism and the premise of insuperable class conflict). What remained was the conviction that social democrats could cooperate with representatives of other classes in parliamentary coalitions to advance a reformist “welfare-state” agenda. But social democracy is not just

Keynesian economics plus social security; it involves a more communitarian idea of citizenship. To have a dignified life, a person should enjoy a certain degree of immunity from blind market forces and personal misfortune. The goal of social democracy is then to offer a clear alternative to liberalism and to exempt important realms of life from the market and its tendency to convert everything into a commodity. Berman accordingly criticizes Giddens and other “third-way” theorists for going too far to accommodate liberalism within social democracy.

The most elaborate and sophisticated attempt to explain and justify social democracy has been proposed by German scholar Thomas Meyer. Like Berman and Giddens, Meyer regards social-democratic theory as a subset of democratic theory; unlike Berman, he considers it a branch of liberal democracy. He grounds social-democratic principles on the catalogue of basic rights endorsed by the United Nations in its two 1966 covenants that were subsequently ratified by most countries. These principles include not only the older “liberal” rights but social, economic, and cultural ones as well. The advantage of this move is that it need not invoke controversial philosophical principles. We have all bound ourselves to observe the covenants; Meyer simply underscores the fact that they—especially the social, economic, and cultural rights—imply a commitment to social democracy. Drawing on T. H. Marshall, Meyer insists that the traditional liberal preference for negative liberty must be broadened to include the positive liberties that “social citizenship” alone can confer; otherwise liberalism itself becomes incoherent. As Meyer puts it, rights must have real-world efficacy, not just formal validity. That is, people need meaningful opportunities to exercise the liberties guaranteed them in old-fashioned liberalism. Furthermore, social-democratic policies have become indispensable for maintaining the *legitimacy* and stability of modern societies. Contemporary citizens expect governments to protect them from a variety of risks, from unemployment, ill health, and pollution to global warming. When nation-states fail to deliver the goods, they lose legitimacy in a normative sense (they are “defective democracies”) but also empirically, in that dissatisfied citizens tend to withdraw their cooperation. Finally, Meyer accepts the argument advanced by Giddens and Berman in different ways: Modern social democracy must be about expanding democracy itself. Civil society must be given its share of responsibility,

opportunities for participation in decision making must be broadened, and even the private economy must be democratized as much as possible (as in the rights of co-determination for German workers).

Conclusion

Social democracy still implies commitment to social-welfare policies, public goods, and interclass cooperation within a mixed economy guided by Keynesian principles. But after nearly a century of practical experience, its advocates have begun to reflect more searchingly on its foundations, aims, and possibilities and have incorporated a variety of new concerns into it. Today, social democracy is more about democracy and far less about socialism than it once was. Looming on the horizon, however, are the increasingly serious economic challenges facing social-democratic economies and governments, replete with fiscal pressures to cut back on economic entitlements and popular resistance to these cutbacks.

Socialism

In the mid-twentieth century, Joseph Schumpeter (1883–1950) reluctantly predicted the fall of capitalism and the triumph of socialism. More recently, political scientist Francis Fukuyama announced the demise of socialism and the triumph of liberal capitalism. Observing the growing influence of the People's Republic of China in the world, together with the shock to world capitalism of the banking and financial crisis of 2007, Fukuyama's judgment seems no sounder than Schumpeter's. The subsequent dislocations in the social and political fabric of several southern European states surely allow for the possible resurgence of socialism. Moreover, the documentary filmmaker Michael Moore, in *Bowling for Columbine* (2002) and *Sicko* (2007); the philosopher Michael Sandel in *What Money Can't Buy* (2012); and the economist Joseph Stiglitz in *The Price of Inequality* (2012), although not expressly socialist, nevertheless approach today's social, economic, and moral questions in a manner that would appeal to many socialists. Perhaps before deciding whether to consign socialism to the past, we should understand what it is we are considering dismissing.

What Is Socialism?

Although the word *socialism* in a narrow economic sense refers to government ownership of the means of production, it is also inherently political—much more so than conservatism and liberalism, which have a life, a meaning, and a utility in the wider world. Socialism refers to a

political organization or system dedicated to bringing about a specific kind of state or society. Socialism came into the political discourse in the 1820s and 1830s, became a major player on the world stage (outside of north America) after World War I, and ceased to be a major world force around the time of the fall of the Berlin Wall in 1989 (the Chinese exception notwithstanding).

Although it may be easy to locate, socialism is notoriously difficult to define. We might start by considering the aims of the British Labour Party, avowedly socialist for much of its existence. Clause Four of the party constitution, written in 1918, sought to:

secure for the workers by hand or by brain the full fruits of their industry and the most equitable distribution thereof that may be possible upon the basis of the common ownership of the means of production, distribution and exchange, and the best obtainable system of popular administration and control of each industry or service.

This conception is the gist of socialism: It constitutes an attempt to create a society in which rewards and efforts are shared equally through public control of the major agencies that shape people's lives.

The Origins of Socialism

The word “socialist” first made its appearance in November 1827 when Robert Owen's *Co-operative Magazine* advanced the principle that cooperation was superior to competition and that consequently capital should be “socially” and not privately owned. In France shortly after, socialism was discussed, if not exactly championed, by Pierre Leroux in *The Individual and Socialism* (1834) and by the novelist and social critic Marie Roch Louis Reybaud in *Studies on Modern Reformers or Socialists* (1841). Continental writers were responding to earlier debates prompted by the writings of the so-called Young Hegelians, a disparate group of German thinkers inspired by aspects of Georg Wilhelm Friedrich Hegel's theories concerning the nature of liberty. This group included Karl Marx and

Friedrich Engels. Owen outlined a critique of contemporary capitalism that was two-pronged, the one moral and the other economic. The moral critique argued that people *should* be far more equal than they were and that greater equality could most judiciously be brought about through the social ownership of industries and enterprises. The second critique suggested that social ownership was not simply morally superior but also more economically efficient. Under socialism people *could* be more equal; not only would the cake be more fairly divided, but also it would be larger. Similar arguments infused the work of continental writers such as Leroux and Reybaud and of several Young Hegelians. The emergence of socialism in the early nineteenth century was a response to the appalling living and working conditions with which the newly created industrial working class had to contend in Europe.

From the beginning, however, equality was a contested concept, chiefly because it had never existed. Inequality, on the other hand, was everywhere, and it was growing. It is easy to see why socialist thinkers might believe that a more equal society was more desirable; but it is not at first so easy to see why they believed it to be feasible. After all, there were many who believed that inequality was either the natural or the God-given basis of a stable social order. So where does the belief in the feasibility of equality have its origin?

The Moral Argument

The moral case for egalitarianism draws its inspiration from Judeo-Christian tradition and more especially from the teachings of Christ himself. After all, Christ had been a manual worker, and when he told the pious young man who sought to follow him to give his wealth up to the poor, he seemed to be advocating a society of economic equality. The Bible states that in the first Christian community, those who owned property sold it and redistributed the proceeds “unto every man according as he had need” (Acts 4:35). The socialists’ case for founding the ideology on Christian teaching seems strong; it was often said that British socialism, for example, owed more to Methodism, and certainly to the Christian inspiration of John Ruskin, than to Marxism. Despite the opulence of the medieval Church, at

Christianity's core was the fundamental belief that all people are created in the likeness of God and equal in his sight.

It would be difficult to establish that popular movements such as the Peasants' Revolt in England (1381) were prompted by a belief in equality as opposed to a more human desire to ease poverty. Nevertheless, some of its leaders, such as the friar John Ball, were moral egalitarians; so too were the revolutionary movements during the English Civil War, notably, the Diggers and the Levellers, who believed that social equality was the essential precondition for the flourishing of liberty and the creation of community. Later, the French revolutionaries, or at least some of them, also claimed that their struggle was to bring about that condition of equality that was the birthright of all and the prerequisite of liberty and community, or fraternity. So nineteenth-century socialists inherited these essentially *moral* claims, which they considered to be natural and eternal. But what gave the drive for equality greater force in the early nineteenth century was the growth of industrial capitalism; it seemed to destroy even the possibility of equality and hence of liberty and community. Socialists would have to take it in hand.

The Economic Argument

The economic argument in favor of socialist equality was based on the simple assumption that competition was economically inefficient and irrational and did not match cooperation. These essentially economic arguments were pursued energetically on the European continent. Here socialist thinkers took inspiration from the rationalism of the Enlightenment. Henri de Saint-Simon was primarily concerned with making industry, in the widest sense, more efficient. He argued for the establishment of a "Council of Newtons," consisting of eminent scientists, managing directors who would govern the world rationally so as to promote the welfare of all. The creation of wealth, he believed, was the most important human activity since it led to happiness, and the process had to be socialized in order to be planned optimally. "Rule over men," he said—although some say the phrase was actually Comte's—"should be replaced by the administration of things" (1823, 4–5)—a call later given wider currency by Marx, Engels, and the early Fabians. Pierre-Joseph Proudhon

was another uncompromising critic of social divisions based on property. Private property, he declared famously, is nothing but theft; property and wealth should be communally owned and administered.

By far the most important continental thinker was Karl Marx. His critique of capitalism began with a fundamentally moral concern: Humankind is a species being and has a species activity, labor. To find fulfillment, humans must “objectify” their labor in an end product. But under capitalism, workers have no control over the process or product of their labor. Under capitalism, humankind becomes alienated from the fruit of its labor, from the activity of labor, and from its fellow beings, especially from the exploiters of its labor, the capitalists. Why haven’t the workers thrown off this alienating yoke? Because their consciousness is “false,” that is to say, blinded or mistaken. It is not consciousness that determines humankind’s social existence, said Marx, but social existence that determines consciousness. And what determines social existence? The “relations of production” or the way economic life is organized. At this point, Marx’s critique becomes firmly an economic one. Since the relations of production are dominated by the capitalist class, it follows that *all* the institutions that help to shape people’s attitudes are also dominated by the values of capitalism, thus, molding people’s ideas and attitudes (or consciousness). This concept was elaborated later by Antonio Gramsci, who referred to it as “cultural hegemony.” But this state of affairs could not continue forever because a proletarian revolution would inevitably occur. Why inevitably? Because all history hitherto had been driven by revolution, and capitalism’s internal contradictions would lead ineluctably to the growing immiseration of the proletariat, until finally a “true” consciousness of their position would be *forced* on workers, resulting in the final, proletarian revolution and socialism.

But who would lead the revolution? The proletariat could hardly manage such a grandiose objective alone. There would have to be a transitional stage between the overthrow of capitalism and the establishment of the final form of socialism, communism, when strong leadership, a “dictatorship of the proletariat,” would be required from socialist intellectuals. Eventually the state would wither away, allowing socialist communism to emerge.

Marx's theories were to have a profound influence on the history of the twentieth century.

The Conflict Within Socialism

It might be thought that a belief in equality could only draw strength from these two lines of criticism of capitalism, what we have called the moral and the economic. The subsequent story of socialism shows that such was not to be the case. The moralists tended to believe in building socialist equality upward, upon the moral values of ordinary people, whereas the economists' goal of an efficiently run society implied a socialism that would be imposed and administered by a trained elite who would run society in what it considered to be the interests of all. These differences were sufficiently profound to prompt a later observation that the divisions within socialism were just as bitter as conflicts between socialism and competing ideologies. Indeed, in *Socialism* (1975), Robert Berki argued that socialism should be viewed "not as a single thing, but a range, an area, an open texture, a self contradiction" (p. 17). The fundamental dichotomy in socialism was implicit in its original objectives, so it was inevitable that socialist organizations or indeed states would reflect Berki's "self-contradictions."

In his analysis of socialism, Berki devises not two but four styles of socialism: What we have called economic, he calls rationalist; then he subdivides what we have called the moralist into the social democratic, the egalitarian, and the libertarian. He then aligns his four forms of socialism, not entirely successfully, with geographic regions, showing that the reformist, social-democratic form has prevailed predominantly in western Europe and Australasia; the rationalist, in the command economies of the Soviet Union and eastern Europe; the egalitarian, in the developing nations where anticolonialism elided into revolutionary socialist zeal; and finally the libertarian, in the affluent First World with its disdain for the values of capitalism, especially among disaffected young people and their championing of individual freedom. He manages to bring together theory and geography in a comprehensive structure that allows distinctions and comparisons to be drawn.

Western “Social Democracy”

What distinguishes Berki’s social democracy (our moralism) is its faith in what Norman Dennis and A. H. Halsey call the good sense of ordinary people who exhibited an instinctive commitment to brotherhood, *koinonia* (Berki 1975, 5–6) or what William Morris referred to as fellowship whose absence was hell, was death (Morris 1973, 51). This commitment shaped Western democratic parties such as the British Labour Party. For Karl Kautsky, social democracy represented specifically the union of socialism and the working-class movement (laborism), and Berki endorses this idea. The history of the British Labour Party exemplifies this union clearly; the party can trace its origins back to the founding of the Independent Labour Party at a meeting in Bradford in 1893 representing the trade unions and the socialist societies. What united most, although not all, social democrats, was a belief in parliament as the engine of change separating them from those who sought to use trade unions more directly, syndicalists like Georges Sorel, who wished to use the general strike as a means to bring governments down.

It is no coincidence that the electoral successes of such parties followed the extension of the suffrage to the industrial working class in western Europe and Australasia. The first avowedly socialist Labour government was formed in 1910 in Australia. But socialist parties were soon obliged to compromise. In 1919, the German Social Democrat Party, in its Bad Godesburg Resolution, incorporated important aspects of free enterprise into its program. After World War II, socialist governments were common in western Europe, but their socialism was reformist, not revolutionary. The electorally successful social-democratic parties in Scandinavia incorporated elements of liberalism into their programs. In Britain, the Labour government of 1945–50 represented the apogee of democratic-socialist achievement, creating what S. H. Beer referred to as a collectivist state. In the 50 years that followed, this state was administered mostly by Conservative governments, an irony not lost on Labour leaders who, from the late 1950s onward, sought to reposition the party, to “modernize” to meet social change and voter aspirations in a generally more affluent society. This process was common throughout western Europe. Only when Labour lost its fourth successive election in the most favorable

circumstances in 1992 did party leaders make the kind of changes that could truly be described as transformative. These did not take the form of a readjustment of socialism's basic principles; instead, they took the form of a *rejection* of traditional socialism. Social democracy has played a major role in the creation of a western European polity that represents a compromise between the entrepreneurial energy of capitalism and the social conscience of socialism. But in the process, it jettisoned traditional socialism.

Rationalism

Lenin founded the first Marxist socialist state in Russia in 1917 through the agency of what he called the “vanguard” party. No democratic party could flourish in a country so inured to autocratic rule, and Russian workers and peasants could never aspire to a revolutionary consciousness. Marxism would have to be adapted. Lenin's answer was to amalgamate socialism and electrification. He and Leon Trotsky called this strategy the New Economic Plan. By the time of his death in 1924, Lenin had established a formidable bureaucratic machine, which he bequeathed to the pragmatic and despotic Joseph Stalin. For Stalin the basic economic law of socialism was the expansion and perfection of production. This would lead to an improvement in living conditions, but Stalin rejected that “reactionary, petit-bourgeois absurdity” of equality. His attempts to revitalize the Soviet economy and modernize its agriculture led to massive starvation. After Stalin's death—although not immediately after—the Soviet Union became richer, more powerful, and more respected for its technological achievements. This was the socialism that Schumpeter had thought would conquer the world. But after World War II, the sclerotic centralized economy began to fail, and a disastrous war in Afghanistan further depleted confidence. The centrally planned economies of the eastern European members of the Soviet bloc similarly began to falter, and by the late 1980s, the Soviet empire simply imploded. Rationalist socialism had failed in the so-called command economies of eastern Europe.

Berki's categorization of socialism is problematical in some respects, and the development of the People's Republic of China poses a major problem that he did not foresee. He categorized China among egalitarian socialist states; today we would surely see it as rationalist. Its mixture of economic

liberalism and political authoritarianism approximates to the Fabian Bernard Shaw's elitist notion of an effective socialism whose fundamental task was to maximize welfare, not democracy. (Fabian money contributed to the establishment of the London School of Economics to educate the rationalist elite that would rule in the interests of all.) We can speak of a Chinese rationalist model, and although we cannot assume its permanence, we can surely classify it today as an economic success. This model is not to be confused with the so-called market socialist theory, which envisages a benign central agency controlling the economy overall but encouraging individual and local participation and initiative, especially through worker-owned cooperatives, in the economy and in government. The primary working example of market socialism (or economic democracy) was the former Yugoslavia, whose implosion was the result of ethnic and linguistic divisions rather than of economic failure.

Egalitarian Socialism

Berki located egalitarian socialism within the developing world. Lenin himself had thought that such countries would produce a victorious revolution that could provide a detonator for revolution across the globe. Lenin's hope seemed to blossom during the 1970s. Socialist or communist regimes were established in many parts of the world: for instance in Angola, the Congo, Ethiopia, Kampuchea (Cambodia), Mozambique, Somalia, Vietnam, and Yemen. Many others operated forms of what they called socialism, such as Egypt, Algeria, and Libya. What was a hope for Lenin was a dread for the former colonial powers and the United States, and they sought to minimize the spread of socialism. However, this seemingly impressive array has since withered, with only the Republic of Cuba, post-Hugo Chavez's Venezuela, the Lao People's Republic, North Korea, and the Socialist Republic of Vietnam still avowedly socialist. But except for impoverished North Korea, the economy of each is now increasingly capitalist, and each has an unenviable record on human rights. If these states were ever constructed along genuine Marxist-Leninist lines, only the notion of the vanguard party remains. Some vanguards took their socialist zeal to excesses, none more so than the regime of Pol Pot in Kampuchea, where the vanguard Khmer Rouge sought to exterminate practically the entire bourgeoisie. It is estimated that more than 2 million people in a

population of some 11 million were murdered because of their “antirevolutionary” stance. Berki’s egalitarian socialism seems to be disappearing entirely or eliding into some approximation of the Chinese model.

Libertarian Socialism

Finally, to Berki’s last category, libertarian socialism could be linked to the anarchist movements of the late nineteenth and early twentieth centuries. Anarchistic leaders such as Michael Bakunin and later Peter Kropotkin were anathema to Marx, who saw them as unscientific romantics. Bakunin could exult in what he called the creative joy of destruction and plan the overthrow of capitalism, but the anarchist-libertarian influence on the development of socialism in practice was insubstantial. Nonetheless, the rift between Bakunin and Marx disabled the early attempt to organize socialism internationally, although it was World War I, when most socialists put patriotism before socialism, that provided the coup de grace to the international movement, allowing it to be hijacked by the Soviet Union. Nowadays groups claiming to be radical-socialist or anarchist are capable, especially through the astute tactical use of social media, of mounting substantial acts of civil unrest, especially during the various economic summits, but it is doubtful that Berki would have devoted even a chapter to them were he writing today. One thinker who has exercised a considerable influence for several decades is the linguist Noam Chomsky, who describes himself as both a libertarian socialist and an anarcho-syndicalist. In the late 1960s, however, things were different. In May 1968, for example, a spontaneous popular revolt spread through Paris and then more widely and came close to toppling the de Gaulle regime. Throughout the West, and especially the United States, anti-Vietnam protests brought turmoil. But these movements were not specifically socialist, and indeed the Paris riots were opposed by the French communist party. Rebellion and violence were in the air and left a legacy of leftist civic terrorism, but no system of government was in serious danger. In short, then, libertarian socialism, too, has finally proved a failure, and it never enjoyed the early successes that other forms of socialism experienced.

Conclusion

At the present time, socialism is thus everywhere in retreat. It is true that as major Western economies come under danger of collapsing after the recent banking and financial crisis, the opportunity for socialist parties (or right-wing nationalist parties, for that matter) to play a part in confronting those crises might present itself, although their scope for independent action would be limited unless the global economy failed to regain its balance. In the meantime, the challenge is to understand why a system of thought that was hugely influential for almost 100 years and that, in its several guises, was dedicated to a more equal and efficient society from which most would benefit, should have failed so comprehensively. Some analysts, including Chomsky, fault modern socialism's betrayal of democracy as its central flaw, a charge leveled originally at the USSR especially by writers such as George Orwell (*Nineteen Eighty-Four*) and Arthur Koestler (*Darkness at Noon*). But this "betrayal" can also be seen as having been partly fostered by the United States and other capitalist powers, which have overtly and covertly intervened to prevent the possibility of democratic socialism succeeding in such countries as Chile under Salvador Allende.

We began with a simple distinction between moral and economic (then rational) socialism. Socialists believed that the capitalist system shaped people in its own image; change the system, and people would no longer need to be selfish and competitive. Yet socialist societies proved unable to shape citizens into anything other than the often selfish, sometimes peevish, and usually fallible creatures of capitalism. Perhaps this was humankind's nature, and Marx had been wrong to believe that it could be changed by creating a fairer social system. For every heroically productive Aleksey Stakhanov, there seemed to be at least an equal number of wasters and several cheats. Even in the Soviet Union, home to the great socialist experiment, socialism failed to transform the citizenry. The Soviet leadership beat a hasty retreat from moralism into rationalism, resulting in a rigid bureaucracy at best and terror at worst. Nevertheless, there can be no doubt that socialism has helped to shape most modern political systems outside North America, and we should remember that it was to the state that most of the great institutions of international capitalism turned during recent banking crises.

According to Richard Rorty, the real pathos of the final scene in George Orwell's *Animal Farm* was that it portrayed much of the history of the twentieth century: the rise and fall of socialism. Perhaps. But today we live in another century.

Sorel, Georges

Georges Sorel (1847–1922), the French philosopher best known for his *Reflections on Violence* (1908), has been variously classified as an anarchist, a socialist, a syndicalist, and even a forerunner of fascism. Born in Cherbourg, he studied at the École Polytechnique in Paris and was employed in several different cities as a public-works engineer. Beginning in the mid-1880s, he began to contribute essays to the leading French Marxist journals, and he corresponded with a wide range of philosophers including Henry Bergson, Benedetto Croce, the prominent anarchist Pierre-Joseph Proudhon, and with Karl Marx himself. As the Marxist movement fragmented in the 1890s, he generally supported Eduard Bernstein's version. Gradually he came to embrace revolutionary syndicalism as the best alternative to capitalism. But in his heterogeneous writings, he explored many other political ideas, from monarchism to anarchism. He deplored the 1914–18 war but enthusiastically supported the Bolshevik revolution. Although he died before fascism was fully established in Italy, he was not sympathetic to it, despite later claims that he influenced and even supported Benito Mussolini—who later called him the “master of syndicalism” whose writings “contributed most to form the discipline, energy and power of the fascist cohorts” (Midlarsky 2011, 92).

The militant trade union movement in France around the turn of the century (as well as corresponding agitation in Italy and Spain) drew him toward syndicalism, and he began to write the essays that eventually were published as his most influential work, *Reflections on Violence*. Two

features of this work are responsible for Sorel's enduring reputation: his glorification of violence as a necessary engine of social progress, and his analysis of the role of myth in revolutionary change. The gradual development of socialism through education and debate, Sorel said, was a pipe dream—or worse, a cover for so-called socialists' acquiescence in the bourgeois, capitalist order of the times. He warned that socialism and capitalism might in the future form an alliance, and he was right. Furthermore, he distrusted modern science as a tool of the established order. History demonstrates, he said, that only organized violence brings about real change. To summon up and direct that violence, a movement needs a powerful myth. Sorel explores the role of myth in past successful breakthroughs from early Christianity to the French Revolution, and he proposes to devise one for syndicalism. A mythical goal is required to draw us on into the next stage of history. It would take the form of the general strike—not of course a new idea among revolutionaries but one capable of being elevated to mythic status. The general strike could bring together all the disparate branches of socialism and all the working classes in an exalted sense of common purpose and would finally overthrow the capitalist order.

Sorel has been roundly condemned by philosophers of left and right for his advocacy of violence, but at no time did he endorse indiscriminate acts of terrorism or spontaneous destruction. Revolutionary violence must be carefully planned and directed toward specific targets most appropriate to the accomplishment of syndicalist goals. Syndicalism, as Sorel defined it, meant the violent abolition of the political state and of the capitalists who finance and control it, to be replaced by trade union control of the means of production. There are varieties of syndicalism, and not all of them call for violence or for general strikes, but Sorel dismissed them all as ineffective. From the standpoint of political philosophy, he can be characterized as an anarchist (and indeed many anarchists claim him), but he belongs to the tradition—always a minority among anarchists—that not only condones but also celebrates violence.

The concept of “myth” has also drawn criticism down on Sorel. But the attacks have largely been off target because Sorel's critics misinterpret what he means by “myth.” The ancient Greeks would have understood him: “Myths” are not the same thing as “lies” or falsified history but narratives

about who we are and why we are like that. In recent times, fascist movements have insisted that certain myths (such as Aryan superiority and the quasi-divine status of the leader) are objectively true. Sorel would have protested that such insistence misses the point.

Sorel published a number of other books and many articles, but his reputation rests on *Reflections on Violence*. In other works, he analyzed Catholic thought, ancient Roman history, the philosophy of Socrates, and the Dreyfus case.

Sovereignty, State

Sovereignty is the authority vested in the highest offices and institutions of states: their supremacy over all other authorities in a country as defined by constitutional law, and their political and legal independence from each other, as recognized by international law. *Supremacy* means the highest and final authority from which no further appeal is available. A sovereign is not subordinate to anybody. *Independence* means constitutionally separate and self-governing. A sovereign is not somebody else's dependency. Exercising sovereignty is having the final word.

The *Oxford English Dictionary* defines *sovereign* as somebody "who has supremacy or rank above, or authority over, others; a superior; a ruler, governor, lord, or master." That is a broad concept. The core usage, however, is clearly political. A sovereign is "the recognized supreme ruler of a people or country." Sovereignty is "the supreme controlling power in communities . . .; absolute and independent authority." Sovereignty understood as state supremacy and independence was clear by the sixteenth century. The term *state* has a similar historical trajectory, at first signifying diverse meanings: "the governing body of a town or city" (the German word *stadt*, as in Hamburg *stadt*, still carries that meaning); "the rulers, nobles or great men of a realm; the government." What we ordinarily mean by "the state" also becomes fully evident by the end of the sixteenth century: "a body of people occupying a defined territory and organised under a sovereign government": a sovereign state. That shift in usage is an important marker of the political change from medieval to modern.

The notion of sovereignty thus came to be identified, almost exclusively, with the special and exclusive authority of the state or the nation. The word acquired meanings that are characteristic of the modern era: “supreme domination, authority or rule”; “a territory under the rule of a sovereign, or existing as an independent state” (*Oxford English Dictionary*). “Sovereignty” became a qualifier of the term *state*, which implies that some states may not be sovereign: colonial states, states subject to a suzerain power, and “states” of the United States.

Sovereignty subsequently takes another turn in regard to the source or location of supreme authority in a state. Originally that location is the ruler (and his or her dynasty): the sovereign. Later it is parliament and later again the people or nation. The *Oxford English Dictionary* quotes John Stuart Mill’s definition of representative government as capturing a central usage in the modern meaning of the term: “That form of government in which the sovereignty, or supreme controlling power in the last resort, is vested in the entire aggregate of the community.” In other words, it is referring to popular sovereignty.

Sovereignty is a form of authority, but it can easily be construed and interpreted as irresistible or compelling power. The test of a state’s sovereignty could be seen to reside in its capacity to enforce laws and implement policies. Or it could be seen to rest on its capabilities in dealing with foreign rivals and competitors, for example, in military conflicts or economic competitions. Power and authority are closely related ideas, but they are not identical ideas. Authority commands, and power executes. Authority is usually defined by offices that people occupy. That is certainly the case with state authority. State power is defined by the instrumental means—the power apparatus and resources—under the control and at the disposal of those same officials.

That relation of authority and power was already made famously clear in the mid-seventeenth century by the English philosopher Thomas Hobbes. In his *Leviathan*, he was careful to distinguish between the “authorization” of a sovereign government via a covenant or social contract and the “power and strength” conferred on a government formed in that manner. Such authorized governments were equipped with the “strength and means” to

maintain domestic peace and providing for the common defense. If governments lacked such power, their authority would be hollow. Covenants are categorically different than swords, but “covenants, without the sword, are but words, and of no strength to secure a man at all” ([1651] 1968, Part II, ch. XVII).

A world based on state sovereignty is a world of mutually exclusive territorial jurisdictions: a world without overlapping jurisdictions. Supremacy and independence are not two separate characteristics: They are two facets of one overall characteristic. Facing inward, the sovereign is the supreme authority in the country. There can be only one sovereign within a country—even if its authority is divided constitutionally between two levels of government, as in a federal state. A federal constitution merely specifies where supremacy resides on any specific issue, that is, whether at the federal level or at the state or provincial level of authority. Facing outward, a sovereign is but one among many such authorities around the world. In the outward exercise of their sovereignty, states are never in a position of supremacy. They are in a position of independence.

766

Spencer, Herbert

The English scholar Herbert Spencer (1820–1903) is generally credited with making a major contribution to the development of sociology in the nineteenth century, although his writings actually covered an extremely wide range of subjects, partly because he saw himself as the author of a complete worldview—a “synthetic philosophy”—which universalized a theory of progress through evolution. Spencer’s works had a significant impact on the biological sciences (he coined the phrase “the survival of the fittest” in 1864) and on political thought, as he was a formidable advocate of an ultra-individualist version of Victorian liberalism. In fact, his vision of the good society involved such a small conception of the role of government that he might even be described in modern parlance as a *minarchist*, while his evolutionary thought anticipated some aspects of socio-biology and functionalist sociology. Spencer’s critics have often accused him of being an apologist for Victorian social hierarchy, but a more complicated picture emerges if one considers his relatively humble social origins and the controversies that attached to some of his views on religion, evolution, land ownership, and imperialism.

Key Concepts and Influences

One of the central concepts of Spencer’s theories was the “individuation” or “differentiation” of things from their immediate environment, an emphasis that led him to frequently stress the importance of individuality and

specialization. No universal mechanism explained this pluralistic tendency in the world, although, as we shall see later, he believed that it was a common consequence of the tendency for natural processes to have more than one effect and for entities that were originally homogenous to become increasingly diverse or heterogeneous. At one and the same time, Spencer frequently emphasized the *interdependence* of nature in general, and human beings in particular, by using concepts/metaphors such as “the social organism” and “the physiological division of labour.” The latter concept was a redeployment of a well-known argument from economics to biology—and then on to sociology—to the effect that cooperative subdivision and specialization of tasks was a more efficient way of using both energy and resources than self-sufficiency. Like many of the Romantics, Spencer assumed that both creativity and productivity were desirable side effects of an unregulated social order, and he argued that (as a general proposition) every human being should be free to do as he or she willed, provided that this will did not impinge on a similar freedom for others. This idea became known as Spencer’s equal freedom principle. Spencer did not attend a university, and he displayed some of the stereotypical traits of the autodidact, for example, by emphasizing the originality of his own work and showing a certain reluctance to acknowledge his intellectual debts.

Spencer’s intellectual industry and habitual iconoclasm are still admired by scholars today, but his system-building is less in tune with both modern and postmodern sensibilities. It can also be argued that his “scientific” emphasis on the power of collective action contradicts his normative belief in personal freedom.

Spencer the Man

Herbert Spencer’s father was a Derbyshire schoolmaster who educated his son into the English tradition of evangelical, individualistic Christianity from an early age. This induction was reinforced by a period of a little over three years—1833 to 1836—which Herbert spent as the personal tutee of one of his uncles in Somerset, before entering the world of work. The most notable outcome of this education was that the young Spencer’s intellectual outlook tended to balance the claims of natural science with those of

literature and the humanities; a balance that allowed him to develop a variety of novel (and not so novel) hypotheses of his own.

Spencer made his living as a railway engineer from 1837 to 1841 and as a provincial journalist in the years 1841 to 1848. The traditional view has been that Spencer was essentially a dilettante during this period, although some scholars have taken a special interest in an early political publication, a series of letters on *The Proper Sphere of Government*, which were also issued as a pamphlet. Attempts to make a fortune through industrial and medical inventions failed, but his workplace experiences reinforced his lifelong interest in mathematics and the natural sciences. In 1848, he moved from the Midlands to London with the intention of becoming a full-time professional writer, an endeavor that was ultimately successful. After receiving a small inheritance, Spencer spent three years (1853–56) traveling in Britain and Europe, before eventually resettling in London (1856–98) and finally moving to Brighton in 1898, where he eventually died of an unspecified nervous illness in December 1903. Like many Victorians, Spencer believed in the superiority of commerce over militarism, and during this closing episode of his life, he wrote several letters criticizing British imperialism in Africa, and the second Boer War from 1899 to 1902 in particular. Moreover, he showed the strength of his concern by republishing them in an expanded version of his later writings called *Various Fragments* (1897–1900).

Spencer the Writer

Spencer's first book to receive significant public attention was an unorthodox text on ethics and politics (*Social Statics*, 1850–51) that sought to apply his "equal freedom principle" to a variety of practical issues. Then, in 1855, he published the much less successful *The Principles of Psychology*, which attempted to explain human intelligence in terms of the general evolution of the species. This relative failure encouraged Spencer to undertake the grand project of a ten-volume "System of Synthetic Philosophy" to both publicize and explain his general conception of evolution and reply to his critics. The "System" took up most of the rest of his adult life partly because several volumes were amended and republished several times before his death in 1903, although the final volume was

eventually completed in 1896. The major components of the “System” were *First Principles of a New System of Philosophy* (1862), *The Principles of Biology* (1864–67), *The Principles of Psychology*, *The Principles of Sociology* (1876), and *The Principles of Ethics* (1879). Other important books by Spencer were *Education: Intellectual, Moral, Physical* (1860), *The Man Versus the State* (1883), *Descriptive Sociology* (1867–81; and posthumously 1910–34), *The Study of Sociology* (1873), and the posthumous *An Autobiography* (1904)—mostly written in the 1880s.

The Synthetic Philosophy

The religious orthodoxy of mid-Victorian Britain was a fairly literal-minded form of Christianity, regardless of denomination, and so Spencer’s evolutionary philosophy was often charged with both atheism and materialism. This was because, despite trying to appear agnostic rather than deliberately irreligious, it set aside the question of the ultimate causes of things as “The Unknowable.” The basic assumption of the “Synthetic Philosophy” was that force is universally persistent and matter is indestructible, although motion and matter are periodically absorbed and dissipated (“dissolution”) into simpler forms when systems become over-complex and unsustainable. However, in most cases, the “multiplication of effects” over time favors the development of complex bodies in both the inorganic and the organic portions of the universe. The best-known expressions of this “induction” as a “rational generalization” were Spencer’s famous 1857 statements in his essay “Progress, Its Law and Cause,” that “Every active force produces more than one change—every cause produces more than one effect,” and that “throughout creation there must have gone on, and must still go on, a never-ceasing transformation of the homogenous into the heterogeneous” (*Essays* 1897, 37). At much the same time, he concluded that (at least in principle) it should be possible to organize the whole of human knowledge on the basis of the concepts that have just been outlined: multiplicity of effects and evolution from simple to complex.

In later life, Spencer asserted that, as early as 1840, he had become a believer in evolution and accepted that every organism had “arisen by progressive modifications, physically caused and inherited” (as he put it in

Volume I, Part III, of his *Autobiography*, 1904, 176–77). This idea later appeared in Spencer's first publications, and when he was writing *The Principles of Biology* in the 1860s, he concluded that simple forms of life were inherently unstable and prone to change because they were unequally exposed to the primeval forces ("motions") assumed by his synthetic philosophy. As well as noting the effects of heat and light, Spencer speculated that ongoing "pressure on living tissue, by modifying the processes going on . . . [within] it . . . gradually diminishes and finally destroys its power of resuming the outline it had at first." As a consequence, all organisms sought to reestablish equilibrium with their environment through adaptation, which led to the observable phenomenon of organic evolution. Furthermore, complex beings could be said to be "superior" to (or more "efficient" than) their primitive predecessors because they embodied more completely the principle of "the physiological division of labour."

To reach this state of superiority, the more complex species had had to evolve from simpler ancestors. Spencer argued that some individual organisms that changed their behavior to suit their environment thereby created the possibility of alterations to particular organs (say a bird's beak), which could then be inherited, and which could in turn ultimately lead to a general reorganization of the body creating whole new species. Spencer called this "*direct equilibration*," although it was, in fact, the same argument that Jean-Baptiste Lamarck had used several decades earlier regarding evolution through "acquired characteristics." However, Spencer acknowledged that this could not explain all known examples of biological development and he drew on the recently published Darwinian concept of "natural selection" to complete the argument. Accordingly, the "indirect equilibration" of a species and its environment occurred when only a part of a species survived exposure to a selective environmental pressure and an inherited (but static) characteristic allowed the remnant to continue and procreate. Moreover, when a whole species failed to adapt successfully and became extinct—thereby failing the test of "fitness" provided by its environment—the natural world as a whole could be said to have returned to equilibrium despite the temporary loss of diversity.

Methodologically, as well as normatively, Spencer usually took an individualist approach to his studies, although he sometimes placed greater emphasis on social structures and functions. Thus, in the early part of his career, he believed in the efficacy of phrenology: the study of the external structure of the human head in order to understand the personality of the individual head's owner. However, when it came to developing his "Synthetic Philosophy," he did not defend phrenology and contended that human consciousness had evolved as a result of general physical evolution, rather than arising from the state of one particular organ (i.e., the skull). Spencer argued that the sophistication of human thought and language reflected, and corresponded to, the sophistication of the structure and functions of the human nervous system, even if the "substance of Mind" itself could not be known. All the higher animals (and not just humans) made use of mental processes to adjust to their environments and the nervous system changed slowly over time, so that both the physical adaptation and the corresponding association of ideas could be transmitted across the generations. In other words, instinct, emotion, will, and reason were all inherited adaptations that conformed to Lamarckian principles, and a reliable system of psychology would be much closer to zoology than to traditional philosophy.

Gender, Ethics, and Politics

Spencer assumed that the social life of a human group was largely explicable in terms of the psychologies of its individual members, which, as we have already seen, were partly determined by their evolutionary origins but also by their physiological qualities. For example, a tribe of tall people would have a disposition that favored running, and later hunting and sport. In turn, this led him to suppose that the bodily differences between the sexes were sociologically important as well. Thus, in the early work, *Social Statics*, Spencer argued that "differences of bodily organization" and "trifling mental variations" between the sexes should not prevent women from enjoying equal political and civil rights, but in *The Principles of Sociology*, he abandoned this view and argued more conservatively. There, he stated that a woman's intellectual and emotional growth was inhibited by the physiological process of child-bearing, and that the traditional combination of male aggression and female submission had been socially

selected in the earliest stages of human evolution. Hence, Spencer became a firm opponent of what later came to be known as feminism, and he argued that modern women retained a sufficient measure of social power to defend their own interests and to contribute to the education of *all* children within the family. The latter function was particularly important because it ensured the maintenance and development of the charitable ethic that the effective operation of the Spencerian laissez-faire utopia clearly required.

Indeed, one of the most consistently expounded aspects of the Spencerian philosophy was its ethical dimension, for Spencer frequently repeated the equal freedom principle that he first put forward in *Social Statics* (1851): “Every man has freedom to do all that he wills, provided he infringes not the equal freedom of any other man” (*Social Statics*, 1896, 55).

Subsequently, several of Spencer’s later works clarified the alleged benefits of combining utilitarian motives with liberal actions on the same grounds that he had used in his evolutionary psychology (an argument that was by no means beyond challenge but that he seems to have been particularly satisfied with). More specifically, he contended that pleasure enhances function and that negative liberty establishes an “instinctive” connection between actions and consequences, so that individuals can acquire moral agency and develop their own projects. A measure of interdependence associated with voluntary cooperation and restraint based on contract was an inevitable feature of “higher” societies, but this was best reached through limiting political activity, as opposed to engineering it via a system of paternalistic dependence on a political or social elite. Thus, in Spencer’s ethics, good conduct was defined as action that maximized “rational” utility (for everyone) in a society arranged in accordance with the “law of equal freedom.” At the same time, Spencer was eventually forced to admit that his evolutionary principles did not add anything to moral judgment and calculation of a much more traditional kind, and that he had simply made a different, as opposed to a superior, argument for liberalism.

Spencer was a man of his time in that he assumed it was both possible and desirable to construct an objective science of society, but he sometimes recognized that social action should be interpreted in a more empathetic way, with reference to the subjective beliefs of individual human beings, as opposed to so-called objective causes. However, the “functionalist”

dimension of Spencer's thought (whose existence was noted earlier) was particularly prominent in his periodic discussions of economic life, and the physical, biological, and economic conditions of a society, plus the interdependent arrangement of its parts, were far more important to Spencerian analysis than the "independent" role of social ideologies or personal beliefs. "Public Opinion" was important for Spencer's social theory as a whole, but it was conditioned by social and economic factors, which operated in a reasonably regular and "lawlike" fashion. He frequently described human society as an "organism" and drew attention to common features shared with living creatures, such as regulative systems (e.g., governments and nerve systems), sustaining systems (e.g., productive industries and nutritional organs), and distributive systems (e.g., railways, roads, veins, and arteries).

Nevertheless, although an animal organism had a single consciousness that organized its whole being, a "social organism" enjoyed a rich and varied consciousness in each and every "cell" or person. A trained sociologist had the ability to capture this consciousness, at least in an abstract and general way, but it did not follow that legislators could derive a binding and intelligible general will from this. Instead, according to Spencer, society had no moral personality that could justify claims against the interests of its members; it could only progress when enough of those members agreed to the justice of certain practices in the coalition known as "public opinion." Such changes, moreover, were deemed to parallel the zoological process of evolution, so that liberal politics and utilitarian ethics could be seen as "acquired characteristics" that benefited the whole of society, even if, in practice, these theories were contested by conservative and socialist thinkers of a variety of hues, whose ideas Spencer felt obliged to rebut in more polemical works, such as *The Man Versus the State*. In Spencer's sociology, the two great epochs of human history were "militant society" (feudalism) and "industrial society" (capitalism), which had arisen after the original evolution, in prehistoric and ancient times, of the organizing structure of life from family to tribe to nation. As a result of its systematic emphasis on warfare, "militant society" had been superseded because it was unable to allow civilization to progress by "individuation," in particular, the increasingly complex versions of the division of labor that characterized "industrial society." In keeping with the general concept of the "social

organism,” a liberal, market community was presented as a complex and heterogeneous system whose development paralleled that of the “higher” animal organisms because its regulative system—the government and the state—played a specialized and restricted role.

As we shall now see, Spencer did not simply describe the “night-watchman state” metaphorically; he also recommended it with some relish. *The Proper Sphere of Government* (1843) was originally a series of 12 letters that Spencer wrote to a Derbyshire newspaper called *The Nonconformist*, which were subsequently collected together as an independently published pamphlet. This text predates the “synthetic philosophy” but set out many of the views about politics that Spencer held throughout his adult life, and it argued that the true purpose of government was to protect the natural rights of humankind and, in particular, to protect the weak against the powerful. However, Spencer disputed the idea of “the general good” and put forward the view that there was no major cause of poverty except idleness; bad luck was an exception; never the rule. An extremely small, low-tax state was needed to provide cheap and transparent justice, security, and home defense, but industry, trade, charity, education, and health were all best dealt with through voluntary action. To a reader of today, this sounds very much like minarchism or libertarianism. But the radical dimension of Spencer’s views became apparent in his vehement critiques of the Victorian parliament and legal system, of the British empire, of colonization and war (the latter verging on absolute pacifism), and his argument for the enfranchisement of the working class, although he did not specify a particular scheme of franchise.

But could such a small government really cope with the problems of industrialization? Throughout his life, Spencer thought that it could, and although his great rival in the debate about *zoological* evolution, Charles Darwin, sought to show that the dangers of overpopulation (as analyzed 50 years earlier by the English economist, Thomas Robert Malthus) still had a great impact in the biosphere as a whole, Spencer believed that human society could escape that particular threat. In 1852, in the essay “A Theory of Population,” he concluded that the so-called Malthusian trap was an illusion and that the minimal state was best adapted to preside over a scenario where the pressure of population on resources would actually

generate reduced species fertility, increased economic productivity, and the cooperative culture of social sentiments that would sustain and develop liberalism and capitalism into ever more desirable forms, perhaps even eventually reaching a kind of anarchism. In later life, he remained strongly attached to these ideals, but he became increasingly disenchanted with the collectivism of Joseph Chamberlain and the “New Liberals” and the populist element in Gladstonian liberalism: As late as 1881, he was a supporter of the “Anti-Aggression League” that campaigned from within the Liberal Party against William Gladstone’s *de facto* expansionist foreign policy in the name of the famous prime minister’s anti-imperialist “Midlothian” principles.

Instead, in the final quarter of his life, Spencer became closely associated with the conservative school of thought known as “late-Victorian individualism,” most notably through his contribution to the volume of essays *A Plea For Liberty* (1891), edited by Thomas Mackay of “The Liberty and Property Defense League,” an anticollectivist pressure group. However, it should be noted that Spencer merely *appeared* more conservative as he grew older partly because his critics had traveled to “the Left” and partly because the seemingly utopian argument of his most popular early work, *Social Statics*, was actually qualified in a number of respects. For example, one chapter acknowledged the abstract right of civil disobedience to unjust laws—as a corollary of the equal freedom principle—but insisted that its applicability varied “directly as the social morality” was “vicious” (the present) or “virtuous” (the future). Moreover, although a chapter on the land question argued that in the ideal, final phase of “industrial society” everyone would have an equal right to use the Earth’s resources, which could only be ensured through common ownership of land, important conditions were applied to this recommendation. In particular, Spencer argued that the expropriation of most privately owned land (when it was honestly acquired and improved by good management) would involve notable, and probably unaffordable, measures of financial compensation.

Hence, questions of practicality and the distinction between “relative” and “absolute” (that is ideal) ethical principles, which was made explicit in Spencer’s later works on *Ethics*, seem to explain the apparent contradiction

between his earlier and his later politics, plus the recognition on his part that a “land nationalization” argument could be used to justify other socialistic measures of wealth redistribution that were incompatible with the central role of the private entrepreneur in his theories. Yet Spencer’s original formulations were indicative of a certain iconoclastic tendency, given the centrality of land to certain Victorian ideals of “home” and “nobility,” and there was a definite element of inconsistency over time in his attitudes to this subject. Nevertheless, he remains an intriguing and stimulating subject for the modern political researcher.

Spengler, Oswald

Oswald Spengler (1880–1936) was a “reactionary modernist”—one of a loose group of early twentieth-century German historians, philosophers, and cultural critics whose thought was profoundly shaped by the social and political context of the Weimar Republic. Although he never held an academic or political position, Spengler became an immensely popular and influential writer and ideologue whose diagnoses of the decline of Western culture were informed by an ambitious history of human civilization.

Spengler’s main work is the two-volume doomsday classic *The Decline of the West* (*Der Untergang des Abendlandes*) published in 1917 and 1922. Its deep pessimism was gradually moderated in *Prussianism and Socialism* (*Preussentum und Sozialismus*, 1919)—which praised a “true socialism” characterized by martial virtues such as discipline and self-sacrifice—and in *Man and Technics* (*Der Mensch und die Technik*, 1931), which identified industrial technology as a mode of cultural recovery. Spengler’s later work, *The Hour of Decision* (*Jahre die Entscheidung*, 1933), was banned by the National Socialists for its criticisms of their racial biological ideology. Various other notebooks and sets of correspondence have since been published.

Spengler was born in 1880 into a conservative family and had a lonely childhood. Despite early immersion in classical cultures, and the work of Johann Wolfgang von Goethe and Friedrich Nietzsche, Spengler’s academic studies were unexceptional and he worked as a private tutor until retiring on

a modest inheritance. Like Nietzsche, Spengler's uneventful life was characterized by psychological isolation and intellectual independence that, coupled with his material poverty, confirmed his perception of himself as a neglected prophet. Spengler died in 1936 shortly after making the strikingly prescient prediction that the Third Reich would disappear within ten years.

Spengler's thought was a reaction to the cultural crisis after World War I and the liberal and egalitarian values of the Weimar Republic. Such reactionary sentiments were invested in a romantic nationalism inherited from Goethe and Nietzsche based on an ennobling conception of the German spirit—the *Volksgeist*. Yet although such stirring affirmations of the supremacy of German culture were welcomed by a disenchanted population with a recent experience of military defeat and political and economic collapse, they generated a problem—namely, how to reconcile these nationalist accounts of Germany's ennobling historical and cultural richness with its obvious state of present crisis.

Spengler responded by articulating the intellectually and historically ambitious “morphology of world-cultures” expressed in *Decline of the West*. Spengler drew on Georg Wilhelm Friedrich Hegel's philosophy of history to articulate a cyclical model of the history of human civilizations. Cultures, like organisms, pass through a series of predetermined developmental stages whose transition relies on the presence of isolated visionary figures—like Spengler. Those visionaries begin to reorder society around a “prime symbol”—an object or narrative—which symbolizes its values and identity. For instance, the prime symbol of classical (Greek–Roman) culture was the bold and autonomous individual as represented by the nude statue.

This “morphological” process takes around 1,000 years, which Spengler illustrated using dense descriptions of various “cultural forms” (*gestalt*)—including the “Hindu,” “Magian,” and “Faustian”—and used this to determine that Western culture was entering into its inevitable stage of decline. The power of this thesis lay in its attribution of German decline to irresistible historical forces that could only be described and resolutely faced with the martial virtues—like courage and discipline—which Spengler praised.

Spengler's pessimistic determinism lost its appeal during the economic and political optimism of the early years of National Socialism. Later works, therefore, become more optimistic and activist as Spengler argues that the proper response to inevitable decline was not fatalism but heroism and martial virtue. *Man and Technics* urges Germans to become "active, fighting and charged" and to embrace military and industrial technology and manifest their creative and intellectual capacities in defiance of their impending doom. Spengler argued that the history of human cultures was the manifestation of "technics"—a metaphysical force related to Nietzsche's "will-to-power"—and that cultural deliverance was premised on appreciation of the fact that the "soul of man" was identical with the "essence of technics" as an inexhaustibly creative and agonistic force concerned not with utilitarian progress but with dynamic competition and courageous struggle.

Spengler's continuing hostilities toward National Socialist ideology and his refusal to become a state ideologue ensured that his final days were lonely ones spent in reflection on his status as an unheeded prophet. Spengler's pessimistic vision of Western culture influenced both his contemporaries and subsequent thinkers ranging from Martin Heidegger to the Beat Generation counterculture. Few were persuaded by his "morphology of world-cultures," but the power of Spengler's thought lies not in the clarity of his arguments, nor in the plausibility of his claims, but in his polemical intensity and visionary power.

Stalin and Stalinism

Joseph Stalin (1879–1953) became the undisputed leader of the Union of Soviet Socialist Republics (USSR) and the world Communist movement in 1929, after a series of power struggles in which he triumphed over his comrades, ruling until his death in 1953. During his reign, what had been the former Russian empire (transformed into the USSR) was industrialized and modernized, and the USSR became a major world power. At the same time, Stalin's methods in the 1930s were brutally authoritarian and resulted in the deaths of millions of people. Allied with the United States during World War II, and playing a key role in the destruction of the German military machine in that conflict, the USSR quickly became engaged in a global power struggle (the Cold War) with the United States after their joint victory over the Axis powers. As Communist dictatorships were established in eastern Europe and Asia in the late 1940s and early 1950s, modeled on and influenced by Stalin's regime, many believed (or feared) that what Stalin represented might be the wave of the future. The orientation for the USSR and the world Communist movement that he helped to shape and that he represented has been called "Stalinism."

Born Iosip Djughashvili, son of a Georgian cobbler, and allegedly brutalized by his father, in his youth, he studied at the Tiflis Orthodox Theological Seminary but was expelled in 1899. He was soon active in the Russian Social Democratic Labor Party, a Marxist organization dedicated to advancing the struggles of the working class, advancing a democratic revolution to overthrow the absolute monarchy of tsarism, and eventually

bringing about a working-class revolution to replace capitalism with socialism. By 1903, he was drawn to this party's more militant and centralized faction, the Bolsheviks led by Vladimir Ilyich Lenin. In the revolutionary underground, he assumed the name Stalin ("man of steel"). In 1912, he joined in helping the Bolsheviks establish a separate party that proved capable of winning powerful influence in the rising labor movement.

Stalin's basic understanding of Marxist theory enabled him to produce basic educational and polemical articles and pamphlets—for example, on fundamentals of the Bolsheviks' revolutionary program, on the deficiencies of the Bolsheviks' opponents, on the inadequacies of anarchism, on the question of nationalities, and in favor of Stalin's own perspectives and policies in the Communist Party of the Soviet Union (CPSU) and the USSR. Among his major works were *Marxism and the National Question* (1913), *The Foundations of Leninism* (1924), *Problems of Leninism* (1926), *History of the Communist Party of the Soviet Union (Bolsheviks)* (1939), *Marxism and the Problem of Linguistics* (1950), and *Economic Problems of Socialism in the USSR* (1952). Although millions of people throughout the world came to see Stalin, by the 1930s, as the most authoritative representative of Marxist ideology, many knowledgeable people have argued that his interpretations contain oversimplified, dogmatic, and authoritarian distortions of the far more sophisticated, critical-minded, and radically democratic qualities associated with the actual perspectives of Karl Marx (and even of many Bolsheviks whom Stalin ultimately attacked and destroyed).

Compared with others who by the time of the Russian Revolution became leading Bolsheviks (Lenin, Leon Trotsky, Nikolai Bukharin, Gregory Zinoviev, and Lev Kamenev), Stalin distinguished himself neither as writer nor as theorist or orator. He rose in the ranks of the Bolshevik party through his organizational and administrative skills, also developing a reputation for ruthlessness—all qualities that could be useful in protracted revolutionary struggle. With the working-class overthrow of the Russian monarchy in February–March 1917, followed by Lenin's Bolsheviks leading a socialist revolution in October–November 1917, Stalin assumed an important role in the Bolshevik organization (renamed the Communist Party in 1918) and in

the new Soviet Republic as the commissar of nationalities. In 1919, he became part of Politburo, the central leadership of the Communist Party. Between 1919 and 1922, he accumulated additional positions of authority culminating in the newly created position of Communist Party general secretary (nominally subordinate to the Politburo, but in fact—through subtle manipulations—increasingly able to “guide” its decisions). Stalin’s power was greatly enhanced because, during the brutalizing Russian Civil War of 1918–21, “emergency measures” were established that gave the Communist Party a dictatorship over the country’s political life.

During his last fatal illness in 1922–23, Lenin waged a struggle from his sickbed against Stalin’s authoritarian policies and excessive power—enlisting the support of the brilliant revolutionary Trotsky. But two other key Communist leaders, Zinoviev and Kamenev, initially distrusted Trotsky and preferred a practical Bolshevik stalwart like Stalin. After Lenin’s death, they discovered that Stalin’s control of the party’s and government’s bureaucracy allowed him to sweep aside their perspectives. They joined with Trotsky to struggle against bureaucratic corruption and maintain a revolutionary-internationalist orientation for the Communist International. They were no match for the powerful apparatus under Stalin’s control, and Trotsky was even expelled from the country. Other veteran Bolshevik leaders aligned themselves with Stalin to defeat this opposition, the most prominent being Bukharin—who was soon swept aside for opposing some of Stalin’s most brutal policies.

In 1928–30, Stalin’s “revolution from above,” through the forced collectivization of land and rapid industrialization, employed extreme repression and violence against masses of peasants and workers who resisted the exploitative effects of his new policies. Much of the USSR’s agriculture was wrecked, resulting in famine that cost the lives of perhaps five million people. Although the Communist apparatus under Stalin tightened its control over the intellectual and cultural life of the country, many seasoned Communist Party members nonetheless began to question Stalin’s policies. In several sensational “purge trials” from 1936 through 1939, the Stalin regime claimed that a traitorous conspiracy against the USSR had been hatched by Trotsky, Zinoviev, Kamenev, Bukharin, and a majority of those who had led the 1917 revolution. Tens of thousands of

Communists were arrested, in many cases threatened, beaten, or tortured into giving false testimony against themselves and others, and shot. Many more were sent to forced-labor camps. Millions of people were killed.

An immense propaganda campaign proclaimed that socialism was now being established in the USSR and orchestrated a personality cult glorifying Stalin. At the same time, the mobilization of many millions of people animated by the idealistic goals of socialism contributed to impressive economic development. Employment, the necessities of life, and an increasing number of social improvements were guaranteed to ever-broader sectors of the population. Much of the increase in industrial output was made at the expense of quality (half of all tractors produced in the 1930s are said to have broken down), and government figures indicating that overall industrial production increased by about 400 percent between 1928 and 1941 are undoubtedly inflated. Yet the USSR did become a major industrial power in that period.

Stalin's "socialism" had little to do with the genuine economic democracy and expansion of human rights envisioned by the thinkers of classical Marxism. Instead socialism was defined narrowly as state ownership and centralized planning of the economy, with "correct" policies ensured under the direction of the Communist Party, of which Stalin was the undisputed leader. Much was made of the upward mobility that placed many workers or peasants in positions of authority in the governmental and economic institutions. Yet such *former* workers and peasants were actually graduating into the ranks of a privileged elite whose primary loyalty was to the Communist Party leadership headed by comrade Stalin. Associated with massive repression and lethal state terror, Stalin was nonetheless seen by many in the USSR as a heroic and benign leader. Some of the repressions even had a "democratic" aura during the 1930s presumably because they were directed against state and party bureaucrats who had become unresponsive to the needs and desires of the people. There was a mobilization of popular support in workplaces and communities (some of it forced, and some of it sincere) for purge trials and executions.

A central aspect of Stalin's perspective was the notion of building "socialism in one country." Marx and others following in his theoretical

footsteps had seen capitalism as an international system that could only be replaced by socialism on a global scale. More than this, socialism was seen as a radically democratic system that could only be based on relatively high living standards and cultural levels for all people, made possible by high levels of industrial development and productivity that capitalism's Industrial Revolution had created in the nineteenth and early twentieth centuries. Yet Russia had yet to experience such "modernization" that would be the basis for a socialist future.

Lenin and other Bolsheviks (including Stalin himself up to 1924) had insisted that the Russian Revolution of 1917 could initiate the process of world socialist transformation but that socialism could not be established in economically and culturally backward Russia until other countries—particularly industrially more advanced countries—were also able to undergo socialist revolutions and then cooperate in the development of a global socialist economy. This was one of the reasons for the 1919 formation of the Communist International, whose aim was to help build Communist parties in all countries of the world, and to advance revolutions in all lands, thereby making socialism possible. Despite substantial hopes and enthusiasm, and what seemed like almost-revolutions in several countries, by the early 1920s, revolutionary Russia still found itself isolated in a hostile capitalist world.

In 1924, Stalin led a powerful current in the Communist Party bureaucracy in insisting that Russia could achieve socialism independently of the rest of the world. This had three consequences: (1) It encouraged the hollowing out of the definition of socialism to make it consistent with state-sponsored industrialization and "modernization"; (2) the Communist

Party and state bureaucracy overseeing this forced economic development became increasingly authoritarian; and (3) it caused the government of the USSR to seek friendly relations with, not the revolutionary overthrow of, as many capitalist countries as possible.

As a consequence of systematic efforts to establish positive relations with the capitalist world, dynamics were unleashed in the world Communist movement that pulled Communist parties of other countries away from making revolution in their own countries into becoming instruments of the

USSR's foreign policy (to defend the "homeland of socialism"). This became the case particularly after the 1933 rise to power in Germany of Adolf Hitler and his Nazi movement. Worried by Hitler's promise to invade and destroy the USSR, in 1935, Stalin and his comrades launched what they called the "People's Front," designed to establish coalition governments of liberals, socialists, and communists that would establish a reformed capitalism, protect democracy, and maintain an alliance with the USSR against Nazi Germany.

There has been controversy among scholars of the Cold War (1946–90) over how this played out from the end of World War II in 1945 to the time of Stalin's death in 1953. Some see a reversion to the earlier Communist commitment of Lenin to seek the global elimination of capitalism, while others see a more defensive foreign policy basically seeking to buttress the power and "modernization" policies of the Stalinist regime in the USSR and its newly acquired "buffer zone" in eastern Europe.

Some interpretations of Stalinism see it—as Stalin himself insisted—as simply the loyal application of the ideas and policies of Lenin. Such interpretations see all adhering to such ideas and policies as basically "Stalinist" (even if they were sharply critical of Stalin and his brutal methods). Many others have insisted on a dramatic divergence between Stalinism on the one hand and both Lenin and socialism on the other. In many cases, such interpretations have explained Stalinism as a form of authoritarian "modernization," not as a variant of socialism. In some cases, such authoritarianism in the name of "socialism" is essentially what is seen as Stalinism. Others insist on a more complex set of perspectives and policies as essential to what Stalinism means.

The more complex definition of Stalinism might be reduced to five components. One involves the definition of socialism that excludes democracy as an essential element, allowing for a *one-party dictatorship*. A second key component involves the insistence that it is possible to create "*socialism*" in a single country—by which is actually meant some variation of socioeconomic modernization. Third, a *powerful and privileged bureaucratic apparatus dominates both party and state*, generally with a *glorified authoritarian leader* functioning as the keystone of this political

structure. (For some analysts, the existence of extensive material privileges and outright corruption among the powerful bureaucratic layers are key aspects of the crystallization of Stalinism.) A fourth component, inseparable from the previous three, involves some variant of a so-called “*revolution from above*”—often involving populist rhetoric and mass mobilizations—driven by the state and party bureaucracy, on behalf of *modernizing policies but often at the expense of the workers and peasants*, which the party dictatorship claims to represent. Fifth, it is within this framework that some hallmarks of Stalinism—extreme and often *murderous repression, as well as propagandistic regimentation* of education and culture and information, and systematic persecution of dissident thought—can best be understood. Some critics assert that these methods ultimately, and fatally, undermined the system represented by the USSR, which collapsed in 1991.

776

State, Theories of the

The idea of the state, broadly construed, is the principal subject matter of political thought. In some significant sense, political theories just are theories of—or at least theories about some aspect of—the state.

Disagreements among various theories are largely disagreements about the nature of the state, and the history of political thought is primarily the history of such disagreements.

Terminological Issues

Contemporary discussions use the word “state” in two different ways. On the one hand, commentators frequently speak of, for example, the separation of church and state, or state intervention into the economy, or state-sponsored terrorism, and when they do so they are typically equating “state” with “government.” In effect, the state is understood to be nothing other than the official apparatus of rule. With this definition in mind, political theorists focus on such questions as what constitutes—and what justifies—the “official” status of the ruling entity, how and why do such entities arise, under what circumstances do they sustain themselves, and what is their proper scope of action? The locus classicus here is Max Weber’s famous essay on “Politics as a Vocation,” according to which something qualifies as a state if its “administrative staff successfully upholds a claim on the monopoly of legitimate use of violence in the enforcement of its order” (Weber 1946, 78). Under this definition, the state

essentially is an administrative staff—a government—that claims an exclusive right forcefully to limit the freedom of individuals, perhaps by imprisoning them or imposing fines on them, or perhaps by killing them.

On the other hand, commentators also talk about the Organization of American States, or the city-states of ancient Greece or medieval Italy, or the newly independent states of the postcolonial world. Here the reference is not to a government but to an entire society. Historian Joseph R. Strayer suggests that a society is a state if it features “political units persisting in time, the development of impersonal institutions, agreement on the need for an authority which can give final judgments, and acceptance of the idea that this authority should receive the basic loyalty of its subjects” (Strayer 1970, 10). In this usage, state and government are not at all the same but are different, roughly as the part is different from the whole. Any state must have a government, but it must also be much more than that. Thus, “state” would be synonymous not with “government” but with a range of other venerable terms such as “body politic,” “political society,” “civil society,” “political community,” and “commonwealth.”

These two different uses of the term “state” are profoundly different indeed, and it may be that certain controversies in political thought should be understood as reflecting little more than terminological inconsistency. The most influential and compelling recent historical account of the idea of the state, Quentin Skinner’s *The Foundations of Modern Political Thought* (1978), argues that the term “state” underwent a decisive change in the sixteenth century when it first acquired its canonical modern meaning as an independent “apparatus” of policy making. According to Skinner, it was with writers such as Jean Bodin, Walter Raleigh, and Thomas Hobbes that the term “state” first became roughly equivalent to “government.” However, the very works that Skinner cites in fact seem highly equivocal precisely on this question. Indeed, it is not difficult to find statements in those works suggesting that “state” refers not to the government but to the entire political society of which, again, the government is merely one part.

In American politics, the term “state,” when used to refer to any or all of the 50 individual states such as New York or Iowa or Oregon, is an anachronism, reflecting the fact that the 13 original colonies did indeed

become, after independence, so many independent political societies united only by a kind of treaty, namely, the Articles of Confederation. Under the U.S. Constitution, which in 1789 replaced the Articles of Confederation, the American states did, and do, seem to retain a certain independent sovereign status. But that status is, at best, severely limited, and may even be entirely dubious. From the perspective of political philosophy, the American states are not really states at all but special administrative subunits of a larger entity—the United States—which is, itself, a state under any plausible definition.

Precursors

Modern conceptions of the state have often been developed in relation or in opposition to premodern theories, and this means that any critical account of modern approaches must pay at least some attention to earlier formulations.

In the second book of his *Republic*, Plato draws a sharp distinction between, on the one hand, a kind of ideal self-regulating community composed of happy, homogeneous, cooperative, and utterly noncompetitive individuals—the so-called “city of sows”—and, on the other hand, a more realistic community composed of people having all the motivations and frailties that we recognize in ourselves and our neighbors and who are, as a result, apt to come into conflict with one another. Plato suggests that only the latter is truly a “political” community—a “polis” or city-state—and in saying this he helps establish a fundamental tenet of all subsequent theories: It is a necessary feature of any state that it has, and operates under the sway of, some kind of authoritative ruling entity that can manage and control the ever-present threat of conflict. Every state, in other words, is governed by some individual or group of individuals—for example, a monarch, an assembly, or a democratic majority—that produces edicts having the force of law. Such edicts must be obeyed on pain of punishment; in all states, the use of force to obtain obedience is, in principle and in certain circumstances, justified. Thus, every state is, to one extent or another, a structure of legitimate coercion, and every state has what later came to be called a “sovereign” entity, that is, an entity whose authority is above all others.

Historically, theories of the state have differed over the sources of the state's legitimacy, the specific purpose that the state is intended to serve, the proper constitution of the ruling entity, and the true nature of that entity's relationship to the body of citizens, whether taken individually or collectively. In these respects, Plato presents what has been considered a hallmark of premodern political thought in the West: The state is natural. This means, among other things, that humans are so constituted by nature to live in states, hence, to be governed by—or in special cases to be themselves part of—a ruling element of some kind, a government. Just as it is in the nature of a plant to grow from its roots in the soil, so is it in the nature of a human to live in a state. On such an account, moreover, the purpose of the state is to embrace and reflect what nature requires; for Plato, this means ensuring that each individual leads the particular kind of life to which he or she is most naturally suited. Some of us are naturally suited to be rulers, others to be warriors, and still others—the large majority—to be basically producers and consumers of goods and services. The state must see to it that each person performs his or her proper task, and this means, among other things, that the ruling entity will be composed of those few individuals who, in virtue of their inherent capacities and dispositions, are best suited to making decisions for the rest. Although Aristotle proposes a different account of how the state should be ruled and organized, he strongly endorses the idea that the state is a natural entity, that humans are constituted by nature to reside in and be governed by states—humans are by nature a political animal—and that the purpose of the state is, again, to ensure that humans live their lives according to the specific laws that nature prescribes.

Modern Theories

Most of the important political theories of the eighteenth, nineteenth, and twentieth centuries vigorously reject such a natural law account of the state. Strongly influenced by the mid-seventeenth-century writings of Thomas Hobbes and others, they regard the state as an artificial rather than as a natural entity. It is best understood as a convenient and expedient system of rules and offices that humans have invented to live the kinds of lives that they choose for themselves.

According to a common formulation of this approach, the state has its origins in a social contract. Individual human beings living in a prepolitical circumstance—a so-called condition of mere nature, perhaps real, perhaps hypothetical, that precedes the creation of a state—find their lives inconvenient, unpleasant, and even highly dangerous. Such individuals thus contrive to contract with one another to create a political society and, in the process, to confer on some individual or group of individuals the authority to establish and enforce laws. They create, in other words, a state and, in the process, a government of that state. Here, then, the state is not at all natural but a product of human artifice, and its purpose is not to ensure that people live the lives for which they are naturally best suited but to provide them with the opportunity to live whatever lives they wish. The authority of such a state, and of the government that the state appoints, is rooted not in some kind of transcendent natural law but in the free consent of the governed—sometimes given expressly and sometimes only tacitly through habits or practices of free acquiescence.

Modern theories of this kind take two predominant forms. According to one, exemplified perhaps most importantly in the writings of Jean-Jacques Rousseau, the success of such a state absolutely presupposes a citizen body composed of individuals who, as a matter of moral principle, are interested primarily in pursuing the advantage of the community as a whole. In terms of art, these are individuals possessing “civic virtue.” They seek the public interest or, in Rousseau’s term, the “general will,” and this means that decisions of the state are apt indeed to promote the good health of the society. Such an approach is often termed “republican.” The good citizen is thought to pursue, above all, the *res publica*, that is, that thing or things that concern and benefit the state itself.

According to a different, “liberal” model—as presented by, for example, the authors of the *Federalist Papers* and others influenced by John Locke—the success of the state depends not at all on personal virtue but on the effectiveness of laws and institutions in fairly adjudicating disputes among individual citizens, all or most of whom are conceived as rationally self-interested utility maximizers concerned primarily to advance personal or sectarian goals. Here, the state is understood to be an arbiter or umpire adjudicating disputes internal to civil society. Its job is to secure the peace

in a way that is consistent with principles of justice, but also in a way that preserves the freedom of individuals—their rights—to formulate and pursue their own, self-determined life plans. According to such a formulation, the public interest is to be achieved not by a kind of conscious collective commitment to the good health of the community as a whole but through a process of political give-and-take conceived as a matter of competition and negotiation among particular, sectarian groups and individuals governed by fair rules that conduce to equitable outcomes.

Republican and liberal approaches are thus sharply at odds. But they generally agree that the state is a human construct, not a natural entity, and that its goal is not primarily to make people better but to make them free. These claims are questioned by yet another modern approach, associated with writers such as David Hume, Edmund Burke, and others who are sometimes thought of as “conservative.” According to such a perspective, the state is not an intentionally created contrivance. Rather, it represents and is legitimized by those traditions of thought and practice within a society that have proven, over a period of centuries, to be useful and effective through sheer persistence and in virtue of constant, incremental, and often unostensible habits of self-analysis and self-correction. Moreover, there never was and never could have been a social contract in part because individual human beings are not free, at least not in the way that republicans and liberals have supposed. Indeed, the idea of individualism—the notion of individual persons as discrete, autonomous, and independent agents—is suspect. For individual choices and actions actually reflect, and cannot but reflect, established and traditional cultural mores or customs. We are products of our history and our circumstance, and those self-same mores and customs provide, as well, the foundations of the legitimate, authoritative state and determine how that state should behave.

These various, seemingly antithetical perspectives are brought together in a grand synthesis proposed by Georg Wilhelm Friedrich Hegel. According to his theory of “objective spirit”—outlined most fully in the *Philosophy of Right*—Hegel argues that the idea of the state, which he terms the “rational state,” embodies without contradiction both the primacy of the interests of the state itself and the genuine liberty of the individual. On the one hand, the laws, institutions, and habits of the state, properly understood, reflect

the cumulative discoveries of human reason as it develops in history. Just as, say, the axioms and theorems of mathematics unfold over time through a long and often tortuous process of conjecture, consolidation, criticism, and reanalysis leading to some new and better conjecture, so does our understanding of the state, and the actual political institutions reflecting that understanding deepen and mature through a similarly difficult, long-term, and ongoing historical process of claim, counterclaim, and reconciliation resulting in a new and better claim. The final outcome is, in principle, a conception and realization of the state that fully reflects the demands of rational thinking. But individual human beings are themselves also understood primarily to be creatures of rational thought. They are most fully human when their actions reflect not the physical or bodily desires of their animal side but the rationally discoverable principles of their intellectual or mental (in Hegel's word *geistig*) side. These ideas on which the rational state is based are the ideas that individual humans at once discover and embrace, and that help the individual realize his or her full potential. The individual who obeys the laws of the state, as embodiments of a larger rational principle, is thus, at the same time, obeying him- or herself as a creature and vehicle of that very principle; and Hegel, following the enormously influential ethical theory of Immanuel Kant, understands such self-obedience to be precisely a definition of freedom.

In pursuing these ideas, Hegel attempts to show how the rational state embodies and subsumes liberal notions of individualism and self-interestedness involving property rights, contractual obligations, and attachments to groups representing competing sectarian claims; republican notions of virtue involving self-assumed obligations based on principle rather than on inclination; and traditional notions of attachment to family and the historical community. These are brought together in a single organic structure. The rational state is like a body—it is a body politic—in which the various diverse parts fit together as a single, unified, functionally differentiated yet fully integrated entity. Such an organicist conception is an old notion, long-predating Hegel, but Hegel presents it with unusual rigor and with the distinctly modern twist that the individuals who are a part of the organism are, for that reason, free.

The Hegelian synthesis of the modern theory of the state was sharply criticized by Karl Marx. According to Marx, Hegel profoundly misunderstands the relationship between the government of a state and all of the other institutions and practices of civil society. In actuality, according to Marx, the state is and can only be a product of the underlying economic structure of society. That structure is always characterized by sharp and deep distinctions between those individuals and institutions who effectively own the means of production—raw materials, machinery, factories, transportation equipment, and the like—and those who do not, most of whom are laborers. For Marx, the authoritative decision-making apparatus of any state is controlled by the former. Laws and policies do not simply reflect the direct interests of the so-called ruling class; they are by definition tools that the ruling class uses to maintain its power. On the one hand, Marxist criticism provides perhaps the most notable example of what happens when we encounter the kinds of terminological inconsistencies described above. For it seems that Marx uses the term “state” to refer to the government, while Hegel uses it when speaking of an entire political society; and to the degree that this is true, Marx’s criticism arguably ignores the deep organicism of Hegel’s account. On the other hand, Marx’s notion of a truly just society, namely, communism, does indeed propose the dissolution of all coercive mechanisms of rule. Specifically, communist society will be a classless society and will, as such, have no need at all for the instrumentalities of law and authority. The communist revolution, when successful, will thus promote the “withering away of the state,” resulting in a nonpolitical society based on free cooperation rather than on coercion, perhaps a modern-day version of Plato’s “city of sows.”

Contemporary Themes

The wide influence—both direct and indirect—of Marxism in twentieth-century social and political thought has promoted a certain tendency to think of the instrumentalities of the state as somehow epiphenomenal manifestations of deeper, more fundamental social structures, economic and otherwise. Some theorists, however, have rebelled against this, and the postwar period has seen an increasing focus on the independent influence of governmental entities in shaping social practice. For example, the important neo-Marxist writings of Louis Althusser suggest that modern political

regimes in developed societies are best understood less as tools of specific commercial and industrial interests than as bulwarks of the larger capitalist system per se. Relatedly, more mainstream theorists have argued for “bringing the state back” when analyzing the causes of social policy and social change. Still others have explored the idea of political society as a locus of nationalist sentiment in which the state functions as a kind of “imagined community.”

Increasingly, however, even the relevance of the idea of the state—whether understood as an entire political society or as the government of such a society—has come under question. For some contemporary theorists, the forces of globalization have undermined the authority, identity, and character of the state. The permeability of borders, the fact that profound social problems such as environmental degradation do not recognize political boundaries, the astonishing developments in transportation and communications technology that have shrunk the world and weakened national identities, and the ever increasing internationalization of commercial enterprises—all of this has served to suggest that the focus of a meaningful political theory should be either on various kinds of international “regimes” such as the European Union and the International Monetary Fund or on substate entities such as communities, militias, local social movements, traditional tribal entities, commercial enterprises, and the like.

Nevertheless, some theorists have sought to deepen and refine our understanding of the idea of the state itself as an element in our shared conceptual apparatus. In part, this has involved a certain development and updating of earlier controversies between liberals and republicans. John Rawls, for example, has conceptualized the liberal state as a system of mutual toleration based on reasonable rules that allow individuals and groups having widely divergent beliefs to live together peacefully and productively. For Hannah Arendt, on the other hand, political society fundamentally provides a public space in which human beings can jointly discuss and act on ideals that describe the good of the entire community.

Other writers, however, worry that all of these debates are unhelpful and even unintelligible without a clear sense of the idea of the state itself. What

is it that makes a state—a city-state, a nation-state, a world state—a state? According to one account, the idea of the state is that the state is essentially an idea. Specifically, the state reflects and embodies the collective, shared judgments of a society about how things in the world really are. It is a systematic structure of thought on the basis of which the individuals of a society seek jointly to control their lives and their interactions. Indeed, from such a perspective, the state is neither more nor less than the authoritative manifestation of a specific way of life, reflecting the full gamut of claims of which a particular society is composed. As long as humans live in societies, it is hard to imagine that the state, understood along these lines, could ever be less than deeply and profoundly relevant.

State of Nature

The “state of nature” refers to a hypothetical state of humankind, before the formation of the civil state, lacking any overarching power to establish and enforce laws that keep people in check. Political philosophers use the state of nature as a conceptual tool to justify and express their beliefs about the origin, legitimacy, and extent of governmental power. Although the state of nature is usually considered hypothetically, some philosophers, such as Thomas Hobbes, believed the state of nature could exist in a limited sense in the real world as, for example, between individuals shipwrecked on an island or after the revolutionary overthrow of a government.

One of the first philosophers to use the notion of a natural state prior to the formation of the political state in the context of political philosophy was Plato. Glaucon, one of the speakers in Plato’s dialogue *The Republic*, claims that humans are naturally inclined to act unjustly when it is to their advantage. However, according to Glaucon, inasmuch as most individuals are not strong enough to act unjustly and get away with it, so laws are created to protect these weaker individuals from the stronger ones who would be able to do as they wished. Although Glaucon does not use the term “state of nature,” he implies there is a prepolitical state prior to the agreement to establish laws (an agreement that later philosophers refer to as a “social contract”).

The state of nature became a central concept of political philosophy during the modern period, especially in the thought of two seventeenth-century

British philosophers, Thomas Hobbes and John Locke. Although other modern philosophers, such as Jean-Jacques Rousseau and David Hume, used the concept of the state of nature in their writings, Hobbes and Locke prepared the foundation for its use in political philosophy. Hobbes used the state of nature to defend political absolutism, a view that grants absolute power to a state sovereign in all matters political, ethical, and religious. For Hobbes, the state of nature is a state of war in which all people are natural enemies to one other and, therefore, where humans are in a state of constant fear and the conditions of life are “solitary, poor, nasty, brutish, and short.” Hobbes’s pessimistic view of the natural state of humankind follows from his view that humans are egoistic individuals driven to satisfy their own personal interests. Furthermore, humans are free in a state of nature to do whatever is conducive to their own pleasure and self-preservation. It is easy to see why the state of nature is one of conflict for Hobbes. Although Hobbes believes humans are naturally egoistic, he also considers them to be rational, although imperfectly so. Guided by natural reason, individuals in a state of nature discover “laws of nature” that, if followed, help them achieve their own good. As it turns out, the laws of nature reveal that the best way to satisfy one’s own interests in a state of nature is to seek peace with others. Such peace is accomplished when individuals agree, through a social contract, to establish an absolute common power to establish and enforce laws.

John Locke, by contrast, used the state of nature to justify limited monarchy and even, potentially, a parliamentary republic. As did Hobbes, Locke believed that the state of nature was ruled by a “law of nature” discoverable by reason. For Locke, however, the law of nature is not simply a means for individuals to attain their own interests, but it is a moral law according to which no person should deprive others of their life, health, liberty, or property. Of course, if all individuals could live by this law, the state of nature would be peaceful. However, humans are not always able to interpret and judge the natural law correctly since they may often be biased by natural emotions. Because of these “inconveniences” of the state of nature, it becomes necessary to establish a government that can establish and enforce laws but that is also accountable to the citizenry. Unlike Hobbes, Locke believed that leaders’ power should be limited because absolute power in the hands of one individual, or a small group of individuals, is too

dangerous. Among eighteenth-century writers who used the concept, Jean-Jacques Rousseau developed a secularized variation of the Biblical account of the Creation and Fall of humankind in his *Discourse on the Origins of Inequality* (1755). Here the development of metallurgy and the division of labor and property in particular were held responsible for humankind's lapse from a more primitive but authentic form of sociability and greater personal independence. Variations on this theme were not uncommon in nineteenth-century socialism. At some points, Karl Marx and Friedrich Engels and various of their followers also sought to locate the origins of certain superior forms of marriage and property holding in primitive societies, while holding that these might necessarily be modified in the ideal communist future. Some anarchists did the same, and utopian writers have often referred to some variant on "natural society" as an ideal golden age akin to that described by ancient Greek and Roman writers. Speculation as to the original condition of humanity now shifted from a largely philosophical starting point to an anthropological one. As a means of approaching the question of original human equality, the use of the device of the state of nature also gave way in this period to other forms of argument, chiefly political and economic and often rights-based.

In the twentieth century, John Rawls used a concept he called the "original position" to defend a theory of justice that could provide foundational principles for the creation of a just society. The "original position" is a more abstract version of the state of nature. In the original position, humans are imagined to be behind a "veil of ignorance," completely unaware of their own personal characteristics such as race, age, religion, social class, intelligence, and even their own personal values. In such a state, Rawls claims, rational individuals would choose egalitarian principles of justice that would ensure the protection of individual rights and the fair distribution of social benefits.

Stirner, Max

Max Stirner (1806–56) is best known as the author of *Der Einzige und sein Eigentum* (usually translated as *The Ego and Its Own*), first published in Germany in 1844. His rejection of conventional forms of expression and modes of argument make this a difficult text to read. Nevertheless, the book has had some significant historical impact: It provided a crucial impetus to the dissolution of the Hegelian left as a coherent ideological movement; it played an important role in Karl Marx's intellectual evolution; and it came to be seen as an influential early statement of individualist anarchism.

Stirner was born Johann Caspar Schmidt in Bayreuth, Bavaria. He passed through university without distinction, subsequently becoming a teacher at a respectable private girls' school in Berlin. He became involved with "the free" (a left Hegelian group associated with Bruno and Edgar Bauer) and resigned from his teaching post shortly before the publication of *Der Einzige und sein Eigentum*. The book provoked fierce critical reaction from Hegelian contemporaries but achieved little popular success. Occasional journalism, some translation work, and his second wife's small inheritance (she left him in 1846) did not avert two spells in a debtors' prison. His increasingly indigent and solitary life ended in June 1856 when, after an insect bite on the neck, Stirner contracted a fever and died.

Der Einzige und sein Eigentum resists easy summary. The only restriction on uses of language and means of argument that Stirner recognized was that they should serve our ends. His enthusiasm for aphorism, metaphor,

neologism, paronomasia, and the juxtaposition of words with formal similarities or related meanings makes for some striking prose but cannot be said to aid the reader interested in identifying Stirner's views with precision.

A tripartite model of human development constitutes one recurring motif in the book. Stirner describes a dialectical process whereby an initial stage of "realism" (in which individuals are dominated by things) is replaced by a stage of "idealism" (in which individuals are dominated by ideas), which is itself replaced by a final stage of "egoism" (in which individuals escape domination by dealing with things and ideas as they wish, setting their personal satisfaction above all else). Stirner uses this structure to elaborate individual biography (where the three stages correspond to childhood, youth, and adulthood, respectively) and collective human history (where the three stages correspond to ancient, Christian, and future epochs, respectively).

Stirner diagnoses the contemporary world (part of the historical stage of "idealism") as failing to escape precisely what it claims to have outgrown, namely, religious ways of thinking. In this context, he is especially keen to reject the consensus that Ludwig Feuerbach, the leading figure of the Hegelian left, had completed the critique of religion. Stirner insists that Feuerbach's anthropological reduction of religion had not revealed human nature as it actually was but deified an abstract and prescriptive account of what it would be to be human. In this way, Feuerbach is said to have left the essential core of religion—the positing of an "essence over me"—intact.

In contrast, the egoistic future would rehabilitate the concrete and unique individual to whom this "foolish mania to be something else" means nothing. The egoist values what Stirner calls "ownness [*Eigenheit*]" above all else. "Ownness" is perhaps best understood as a form of individual autonomy that is violated by any desire or action that involves waiving or suspending our own judgment. As a result, it conflicts with all conceptions of obligation or duty, even self-assumed obligations such as those generated by promises. Both morality (which, by definition, posits duties on the individual) and the state (which cannot survive the rejection of any obligation to obey the law) are early victims of Stirnerian egoism. More

positively, Stirner sought to promote the “union of egoists” as a form of association that does not violate “ownness.” This union is a constantly shifting alliance in which individuals can unite without loss of sovereignty. It forms a purely instrumental combination whose good is the advantages that individuals derive from the pursuit of their own interests—there are no final ends here and the association is not valued in itself.

Strauss, Leo

Leo Strauss (1899–1973) was a German-born, Jewish American political philosopher who revived the study of political philosophy in the twentieth century. His complex philosophical reflections exercise a quietly growing, deep influence in America, Europe, and Asia.

Strauss was born in the rural town of Kirchhain in Hesse-Nassau, Prussia, on September 20, 1899, to Hugo and Jenny David Strauss. He attended Kirchhain's *Volksschule* and the *Rektoratsschule* before enrolling, in 1912, at the *Gymnasium Philippinum* in Marburg, graduating in 1917. The adolescent Strauss was immersed in Hermann Cohen's neo-Kantianism, the most progressive German-Jewish thinking. "Cohen," Strauss states, "was the center of attraction for philosophically minded Jews who were devoted to Judaism" (Strauss 1972, 267). After serving in the German army for a year and a half, Strauss began attending the University at Marburg, where he met Hans-Georg Gadamer and Jacob Klein. In 1921, he went to Hamburg, where he wrote his doctoral thesis under Ernst Cassirer. In 1922, Strauss went to the University of Freiburg-im-Breisgau for a postdoctoral year to see and hear Edmund Husserl, and also attended lecture courses given by Martin Heidegger. He participated in Franz Rosenzweig's *Freies Jüdisches Lehrhaus* in Frankfurt-am-Main and published articles in *Der Jude* and the *Jüdische Rundschau*. One of these articles, on Cohen's analysis of Baruch Spinoza, brought Strauss to the attention of Julius Guttmann, who in 1925 offered him a position researching Jewish philosophy at the *Akademie für die Wissenschaft des Judentums* in Berlin.

There Strauss wrote his first book, *Spinoza's Critique of Religion as the Foundation of his Science of the Bible, Investigations into Spinoza's Theologico-Political Treatise* (published in 1930), and he was part of the editorial team for the jubilee edition of Moses Mendelssohn's writings. The work introduced him to various German Jewish intellectuals, such as Hannah Arendt and Walter Benjamin. Others whom he met at the time and with whom he later carried on vigorous epistolary exchanges were Karl Löwith, Gerhard Krüger, Gershom Scholem, Hans Jonas, Emil Fackenheim, and Paul Kraus—who married Strauss's sister Bettina. Many of these exchanges are published in the *Gesammelte Schriften* (Collected Writings) edited by Heinrich Meier (1966). Strauss was also engaged in a critical discourse with Carl Schmitt, who was instrumental in Strauss's receiving a Rockefeller Fellowship, through which he was able to leave Germany before the ascent of Nazism.

In 1932, he left for Paris. He returned to Germany only once, for a few days in 1954. He had accepted an invitation to return in 1965 to accept an honorary degree from, and teach for a semester at, the University of Hamburg, arrangements having been made by Wilhelm Hennis, Carl Friedrich von Weizsäcker, and Wolfgang Ieland. Yet poor health made the trip to Germany impossible (see Meier 1966, Vol. 3, xxv and 690–91). In Paris he married Miriam Bernsohn, a widow with a young son, Thomas, whom he adopted. He later adopted Bettina's daughter, Jenny, after the deaths of Bettina and Paul Kraus. In Paris, Strauss became friends with the Marxist Hegelian Alexandre Kojève and was on friendly terms with Raymond Aron and Alexandre Koyré. He moved to England in 1934, and in 1935, he relocated to Cambridge, where he was associated with the Sidney Sussex College, University of Cambridge. He received access to Thomas Hobbes's early papers at Devonshire, and he met R. H. Tawney, with whom he became a close friend, and Ernest Barker. He immigrated to New York in 1937, and after a research fellowship at Columbia University, he was a visiting lecturer at Hamilton College, Union College, Middlebury College, Amherst College, Wesleyan University, and the New School for Social Research. In 1949, he joined the political science faculty at the University of Chicago, where he was named Robert Maynard Hutchins Distinguished Service Professor in 1959, teaching there until 1969. (He took a year's absence to teach at the Hebrew University in Jerusalem in

1954–55.) He then spent a year at Claremont Men's College and three years at St. John's College in Annapolis, Maryland. He died in 1973, having published 15 books and numerous articles in scholarly journals.

Most of Strauss's writings are careful explications of works by political philosophers that make considerable demands on the mind and heart of the reader. His later writings in particular are written in a dense style that has the appearance of offering no more than summaries of the argument of texts; they have been aptly described as a gift to those of his students who have succeeded in understanding his earlier work and the work of political philosophers taken up in them. Nonetheless, five clear themes are discernible in his writings: the theological-political problem, esoteric writing, the quarrel between the ancients and the moderns, historicism, and the crisis of our time.

The Theological-Political Problem

Strauss followed Johann Wolfgang von Goethe in seeing “the struggle between belief and unbelief,” or the question of the source of the obligations by which we guide our lives, as “the deepest theme of all world and human history” (Strauss [1934] 2011, 23). As a morally serious young man, he was gripped by the apparently irreconcilable conflict between nobility-inducing faith, on the one hand, and the claims of science, on the other, which he referred to as “the theological-political predicament.” In a manner helpful to others, he presented (in his 1965 Preface to *Spinoza's Critique of Religion*) the arguments by which he wrested himself free from modern presuppositions and the remnants of the biblical and classical tradition that had been transformed by those presuppositions, so that the issue of faith versus reason could present itself in full clarity. He made clear that he was assisted in this effort by the work of Heidegger.

Strauss stressed that his writings were appearing at a time when the possibility of philosophy, understood as reason's search for enduring truth, so far from being taken for granted, had been radically called into question by the works of Friedrich Nietzsche and Heidegger. Partly as a result of that questioning, the West had come to be characterized by a protracted collapse of confidence in the possibility of discovering, through reason, a genuine

universal understanding of the world, one by which we can and should take our bearings. Through his life's work as a teacher and a scholar, Strauss faced and led others to face that situation squarely, and he guided the way both to a recovery of the original ground for the rational life in Socratic political philosophy and to a respectful, painstakingly careful account of the developments in modern political philosophy. Attempting to learn something of importance from earlier thinkers, he emphasized, and not merely *about* them, "places an obligation on the interpreter to pay the most careful attention not to interject into [a thinker's] teaching opinions that prevail or threaten to prevail today" (Strauss [1934] 2011, 123).

Ancients

After his early work on Spinoza, Strauss was led, through a study of Moses Maimonides and his predecessors among the Islamic *falasifa*, to the works of Plato. He came to realize that a crisis of reason similar to the one we are witnessing in our time had occurred at the time of Socrates, who became aware that permanent limits to what is genuinely knowable by science or philosophy opened up a remarkable possibility: that the world, far from having the kind of intelligible necessities that reason seeks to uncover in its search for causes, could instead—as adherents of divine revelation had always claimed—be the work of mysterious, creative gods or god, whose powers would render reason's search for causes futile and possibly fatal. Socrates's grasp of this problem, Strauss realized, led him to a "second sailing," that is, to an unprecedented attempt to ground the life of reason not (as the pre-Socratics had attempted) through science itself but instead by means of a preliminary investigation of political-moral questions. It led him, that is, to found political philosophy as a "preliminary" to philosophy proper. The Socratics held to this line of thinking.

Strauss carefully and prudently explained how premodern, Socratic political philosophy, that is, the dialectical investigation of justice and of law that one finds in the Platonic dialogues and in the works of later thinkers who read them carefully, provides a sufficient answer to the question of how one can know that the life led according to reason is the right life for a human being. By his attention to this central question, Strauss helped his readers to undertake the study of political philosophy neither as an antiquarian venture

nor with a politicized spirit but instead as an activity vital to their own lives and the lives of those with whom they live. At the same time, he neither allowed his readers to overlook the peculiar difficulties attending the recovery of reason in our age nor obscured the profoundly agonizing self-transformation that is required of students of Socratic philosophy in any age. And these in turn made him keenly aware of the measures taken by political philosophers to write with a view to the various needs and capacities of their many readers, or with what he called “esoteric writing.”

In presenting a dialectical examination of the problem of justice as the Socratic answer to the theologico-political problem, Strauss emphasized that such dialectic, far from being philosophical or scientific, proceeds on the basis of premises agreed to by the (potential) believer; it proceeds from the given, “prescientific” world of “common sense,” that is, on the basis of premises shared by the nonphilosophic. The examination discloses that humans are animated by a deep and passionate “erotic” longing for self-transcending union with the eternal or divine, over and against awareness of their own mortality, a longing that may be hidden, repressed, or diverted into worldly addictions like monetary acquisition, but it is at work everywhere in political action. But this longing proves to call forth purification by thought since humans also desire escape from delusion. In the best cases, Socratic dialectic purges this longing and with it both political ambition and hope for any possible union with the divine. The conversions of a few erotic potential statesmen to the philosophic life thus give decisive evidence that the philosopher’s own liberation is not idiosyncratic. Dialectic therefore provides the ground of philosophy or science simply, and it was understood to be adequate by later thinkers like Maimonides, al-Farabi, and Marsilius of Padua (who understood the Socratic answer to encompass the most elementary premises of the Bible). But the dialectical purging proves to be healthy for but a few strong souls, and this is the deepest cause of esoteric writing, the “benevolent deception” practiced by Socratics, who grasp the sources of the most firmly rooted moral prejudices that pervade every time and who accommodate their writing to them. The practice of Socratic political philosophy does not, then, according to Strauss, entail *any* promise of a rational politics or morality; it instead includes only a kind of writing that makes contributions

to the edification of the reigning civic virtues, while leading a few morally serious readers toward the philosophic life.

Moderns

Equipped with this recovery of the intention of classical political philosophy, and having undergone the “change of orientation” that it entailed, Strauss returned to his study of the origins of modern political philosophy in the work of Hobbes, reopening the “quarrel of the ancients and the moderns,” which had been temporarily closed by the apparent victory of the moderns. His intention in returning to Hobbes was twofold: to understand modern thought radically and to clear away later developments that had hidden the fundamental questions. Strauss argued that Hobbes, unlike his successors, addressed squarely the question of the right way of life, but that Hobbes did so while “taking for granted” the tradition and, hence, the possibility and necessity of political philosophy, or that he did so with a “neglect” of the purport of classical political philosophy. Hobbes misunderstood that intention to be the attempt to establish the right social order. He and his successors, Strauss argued, were thereby led to put the establishment of that order into the service of the grounding of science. For Hobbes, Strauss claimed, was guided in his thought by an effort to overcome “the cavils of the skeptics”—challenges posed by those who, like John Calvin or the *mutakallimûn*, claimed that the world is fundamentally unintelligible because it is at every moment the work of a mysterious, creative God. Hobbes granted that unintelligibility and proposed against it a phenomenological-positivist science (positing laws made by the human mind and remaking the world on their basis). Hobbes’s new activist or “effective” political science was to be the means to make this science secure, by its disenchantment of the world through a “reorientation” of humanity, away from faith in god or gods and toward “civilization.” Strauss noted that Hobbes and his successors, rather than taking seriously what is disclosed in speech about the good and bad, just and unjust, reconceived political phenomena on the basis of the imposition of an abstract theory, turning away from the speech of statesmen as something infected with imaginative superstition or fanaticism and obstructing the achievement of this-worldly pleasures.

To achieve their end, the moderns laid out new theoretical principles of social life: “power,” rather than the good as the end of striving; natural rights, or selfish but justified claims, rather than natural or divine obligations; a state of nature rather than a perfect beginning; natural laws as merely human rules showing the best means to peace and comfortable living; and a social contract of individuals to secure their rights. The aim of the liberal regimes founded on these new principles was, Strauss argued, to de-politicize human life, an aim that required a rejection of the Socratic claim that humans have an erotic longing for eternity. That longing was seen by the moderns as merely a distorted form of desire for the goods of this world, with which—thanks to the conquest of nature by the new natural science—humans could be made content. The new, liberal regimes were designed to provide an enlightenment and a liberation from ignorance, superstition, and prejudice, both through the scientific conquest of nature and through the acceptance of the new, “rational” understanding of justice (natural rights) rather than the categorical duties to which an allegedly divine law summons them. The disenchantment of the world through the success of the new political science was, then, a key part of attaining the desired end: a world in which science had succeeded at last in grounding itself, that is, met the challenge posed to it by divine revelation.

The Modern Failure, Historicism, and “The Crisis of Our Time”

Having come to understand early modern political philosophy as aiming to answer to the theologico-political problem in this manner, Strauss came to see the West’s eventual loss of faith in reason as having been an incipient problem from the beginning of modernity, with each successive attempt to correct for it, or “wave,” deepening the crisis. Strauss saw “liberal relativism,” the relativism “according to which the one thing needful is respect for diversity or individuality,” as growing out of the natural right tradition of tolerance, which was explicitly based on Hobbes’s denial that there can be anything intrinsically right or good. That kind of individualism, which sought to obviate the need for any religious or transcendent meaning, failed to answer what proved to be an enduring human longing for such meaning; it at least suggested a fundamental meaninglessness or

whimsicalness to self-sacrificial just or noble action and, hence, could not be sustained. Its rejection was perceived and anticipated by Jean-Jacques Rousseau, whose call to build a high democratic culture of human-made humanity, based on the “general will” of peoples, over and against early modern rationalism, was taken up in earnest by the German Idealists. Hence, the first form that the moral rejection of early modern rationalism took, Strauss found, was “historicism,” the belief that the human mind is decisively and inescapably formed by the time and place in which we find ourselves. The “historical school” offered meaningfulness in the customs and laws that had grown up in the course of a people’s history, embodied in a general will, and—to ensure that that will was not arbitrary or erroneous—understood as one particular expression of an evolving human consciousness, one “progressing” toward full rational self-consciousness. But this too failed to satisfy morally serious human beings because of its fundamentally secular or this-worldly orientation. The problem was illustrated by Strauss with the example of early, strictly political Zionism, which had to transform itself into “cultural” Zionism if it was to capture the minds and hearts of those who understood themselves to be part of a noble tradition of suffering. But that transformation meant that what had been understood by the tradition as the revealed word of God would instead be understood as a product of the human mind. It thus clouded the central issue of the right way of life—of faith or reason—and failed to satisfy the longing for transcendence of orthodox believers.

Although this attempt of the historical school failed, the belief that history added a dynamic dimension to human existence nonetheless persisted, and it was radicalized in the thought of Nietzsche, who proclaimed the need for a departure from the horizon of Western rationalism that threatened to produce satisfied “last men,” and Heidegger, whose doctrines Strauss calls “radical historicism” or “Heideggerian existentialism.”

Strauss found, through examination of Nietzsche’s articulation of the West’s crisis, that at the bottom of the modern political-philosophic attempt to ground philosophy over and against the claims of revelation was intellectual probity—or the ability to face up to hard truths—which he understood as a great, and always necessary, but fundamentally insufficient, virtue. He saw this virtue reaching its fullest form in Heidegger’s apparently atheistic

analysis, in *Being and Time*, of the call of conscience as the call of Care. But he saw probity's insufficiency showing itself in, among other things, the fact that death becomes Heidegger's new god, summoning humans to serious, stubbornly resolute, elevated action. And although Strauss was explicitly indebted to Heidegger for his understanding of the "neglect," by early moderns, of fundamental questions that Heidegger's "destruction of the tradition" had first made possible, he nonetheless found Heidegger's historicism to have its own unexamined or taken-for-granted character. For Heidegger's destruction of the tradition was carried out without awareness of the art of esoteric writing that had been practiced, in various forms and for various reasons, by thinkers within the tradition.

The rich unfolding of modernity thus seemed to Strauss to represent not only a neglect of, but also a progressive estrangement from, erotic human nature as disclosed by Socratic dialectics. He accordingly characterized the result as an "estrangement from man's deepest desire and therewith from the primary issues" and called this the "price which modern man had to pay" for attempting to conquer nature (1959, 55). As a result of the failure of modernity, moreover, modern science and philosophy lost sight of what is required to establish the ground of the rational life.

Strauss's "Politics"

In the light of Strauss's account of the respective answers to the theologico-political problem, and especially his understanding of the magnificent failure of the modern attempt, in which philosophers became active proponents of political change, he was inclined to judge classical political science and practice as superior to modern political science in most respects. Classical philosophers' nobler accounts of politics, Strauss found, deliberately sought to do justice to the phenomena of political life, as actually experienced and viewed by the pre-philosophic, engaged citizen. Modern political philosophy, by contrast, had resulted in a relativist social and political science that is increasingly unable to recognize either tyranny or human nobility. Although Strauss's writings manifest a reluctance to offer theoretical guidance to contemporary statesmen, he did stress that our world has been transformed in ways that adversely affect the souls of both citizens and potential philosophers, and he did not refrain from offering an

(unsettling) account of our contemporary situation, warning against two possible directions of liberal democracy, the regime that he found the best of the available alternatives in the modern world.

The first direction is a cosmopolitanism that it is rooted in the belief that human life as such is an absolute good, a cosmopolitanism that embraces and even promotes a peculiar humanitarianism that goes hand-in-hand with a ruling concern with pleasure and entertainment and unwillingness to devote one's life to high ends. Cosmopolitanism necessarily leaves little room for reverence, which is primarily for one's particularistic heritage or for tradition. Since Strauss regarded reverence as the matrix of human nobility, he saw this tendency as problematic for liberal democracy, which becomes ever more permissive and individualistic, tending toward a leveling moralism and an overemphasis on the virtues of sociability at the expense of more difficult virtues. Following Max Weber, he found modern democracy to foster "mass culture," one "which can be appropriated by the meanest capacities without any intellectual and moral effort whatsoever" (Strauss 1968, 5), producing a decay of the spirit, of taste, and of the mind. Liberal republican energy and stability are necessarily threatened by this dwindling of spiritual resources and cultural shallowness.

Liberal democracy is likewise threatened by the growing void left by the recognition of this spiritual impoverishment. For such impoverishment cannot take place without an eventual terrible awareness of it, and it would not be unreasonable to expect unforeseeable forms of longing and rebellion against the political order that seems to be causing a diminution of natural human aspirations. The yearning for transcendent purpose may result in manifestations of preliberal religiosity or various sorts of desperate nihilisms that aim to destroy modernity, in perverted and fanatic expressions of the natural and inevitable civic concern for the sacred and willingness to fight on its behalf. Even within the confines of liberal democracy, Strauss suggested, that concern had already begun to produce an incoherence in liberal thinkers, like Isaiah Berlin, who turn away from reason and toward Heideggerian resolute or deadly serious decision. Since reason cannot supply the transmodern norms that would temper modern liberal rationalism and political universalism in the way its citizens suspect it needs to be, liberals may attempt to abandon reason and stifle self-critical

thinking. Modernity's disenchantment of the world eventually drives even the nonbelieving morally serious person, in other words, to a form of misology, or to what Strauss, citing the experience of Europe in the 1930s and 1940s, called "fanatical obscurantism," that is, a desperate, moralistic flight from what reason seems to reveal about the apparent groundlessness of our moral and civic being.

It is perhaps for this reason that Strauss, in the introduction to his most widely read work, *Natural Right and History*, sternly warns those looking to find a basis for natural right not to be led by the spirit of fanatical obscurantism that characterized their foes. He also makes abundantly clear that political life does not admit of the radical consistency that characterizes all genuine thinking. Not all of his students have taken these warnings to heart. He can be said to have fostered an understanding of the tendencies and noblest aspirations of liberal democratic regimes and moderation of their less healthy tendencies, in the service of elevation of purpose. Strauss's perhaps most enduring legacy in the study of American liberal democracy is manifest in the work of Herbert Storing and his students.

Suffragettes, Political Thought of the

The terms *suffragette* and *suffragist* are often used interchangeably to describe those who campaigned for women's suffrage. However, it is important to differentiate between the two. "Suffragette" is usually applied to those women who adopted "militant" tactics to achieve their aims and "suffragist" to those women and men who favored constitutional or legal methods. The campaigns for women's enfranchisement that began in the nineteenth century and that progress, even into the twentieth century, were patchy. For example, in 1893, New Zealand became the first nation-state in the world to give women the franchise when it allowed all of its female citizens to vote in parliamentary elections, a democratic right that was extended to all women in Finland in 1906.

But it was not until 1920 in the United States, and 1928 in Britain, that women were granted full voting rights on equal terms with men. Yet despite the range and variety of this worldwide activity, the term *suffragette* is particularly applied to those women who were members of the Women's Social and Political Union (WSPU), founded by Emmeline Pankhurst on October 10, 1903, to campaign for the parliamentary vote for women in Edwardian Britain. At this time in Britain, about 59 percent of adult males could vote, based on the ownership of property or occupation of property of a minimum value, but all women remained voteless, irrespective of these property qualifications. It was the ending of this sex discrimination that Emmeline Pankhurst and her eldest daughter Christabel, the chief organizer of the WSPU, sought to break as for 11 years, from 1903 until the outbreak

of World War I in August 1914, they led the suffragette campaign to win votes for women on equal terms with men.

Christabel Pankhurst was the WSPU's key strategist and theorist. She believed that the subordinate status of women in Edwardian society was a result of the power of men and so saw the WSPU, which only admitted women as members, as an important vehicle for fostering a sense of sisterhood that would enable women to stand on their own two feet and articulate their demands. The WSPU's slogan was "Deeds, not words" and at the center of Christabel's political thought was the notion of "militancy," which came to justify the policy and tactics of the suffragettes and to place it within a long tradition of popular radical struggle for constitutional reform. "Militancy" involved women being assertive about their democratic rights, casting aside that false dignity that came with submission, and resisting a tyrannous liberal government. Emmeline Pankhurst eagerly embraced such ideas as did thousands of other women who joined the WSPU.

The first act of militancy is usually identified as taking place on October 13, 1905, when Christabel and Annie Kenney, a working-class suffragette, interrupted a Liberal Party meeting by shouting out "Votes for Women." They were hastily ejected from the hall and imprisoned, and their action made headline news and brought many new recruits to the cause. Noisy protests at Liberal Party meetings became a common tactic as well as deputations to parliament and more symbolic gestures, such as ringing the doorbell of the prime minister's residence on Downing Street. The individual suffragette made her own independent judgment about which militant deeds she would engage in, with some even trying out new tactics without discussion or the approval of the leadership.

For Christabel Pankhurst, the inferior status of women was not a class issue but a problem of inequality between the sexes. Therefore, she did not wish to ally the WSPU to any male political party nor any male-oriented political movement, such as socialism. The WSPU had to become free from class politics and rally all women, irrespective of their political allegiance, and unite them as an independent force. It was in August 1906, at the Cockerham by-election, that the tactic of independence from all men's

political parties, including the Labour Party, was put into practice. A small grouping of disaffected socialist feminists who disagreed with this policy left the WSPU to form another grouping, later called the Women's Freedom League.

By 1909, protesting at Liberal Party meetings was proving increasingly difficult for the suffragettes since women were excluded from such gatherings. In July of that year, imprisoned Marion Wallace Dunlop, on her own initiative, began a hunger strike as a protest against the refusal of the authorities to recognize her as a political offender and, as such, entitled to be placed in the privileged First Division. After 91 hours of fasting, she was released. However, when other suffragettes shortly afterward began to hunger strike, the authorities responded with force feeding. The hunger strike was another form of militant protest, a means of passive resistance against the injustices that women experienced.

By the end of January 1910, Emmeline Pankhurst had called a suspension of all militant tactics, to allow various Conciliation Bills for Women's Suffrage to be presented to parliament. This "truce" with the government remained until November 21, 1911, apart from one week during November 1910. When the various bills failed, militancy was extended in 1912 to include secret attacks on public and private property, such as window-smashing raids in London's West End. Throughout, the WSPU leadership emphasized that the aim was never to endanger human life.

The notion of a "sex-war" between the suffragettes and the all-male liberal government now became prominent, as well as the insistence that the aim of the militant campaign was not just the granting of the parliamentary vote but the abolition of the sexual and economic exploitation of women. Such ideas had a transnational influence, particularly in the United States where the Americans Alice Paul and Lucy Burns, both former members of the WSPU, were determined that their National Women's Party should adopt a more activist approach for the women's cause. Furthermore, it can be argued that the Pankhursts and the suffragettes of the WSPU, in advocating a women-centered separatism, were in many ways forerunners of some of the ideas voiced by radical feminists in Second Wave Feminism in western Europe in the 1970s.

788

Syndicalism

Although its ideas were undoubtedly put on the map by the French social philosopher Georges Sorel, who wrote *Reflections on Violence* in 1908, syndicalism was not the creation of one particular writer or even a group of writers. Despite the “ism” that lends it a theoretical air, syndicalism is best described as a *movement* or as a “philosophy of action” that evolved in the everyday struggle to improve workers’ lives, rather than being concerned to develop a unified body of doctrine. Unlike Marxism, the syndicalist movement offered no sweeping explanations of social change and no fundamental theory of revolution, and it produced no great revolutionary theorists to rival those produced by Marxism. But even if they did not produce any profound analytical texts, syndicalists presented coherent and well-argued cases in many of their pamphlets, leaflets, and speeches. Many syndicalist leaders, despite having little formal education, were what might be termed “worker intellectuals”: not only gifted in their line of political involvement and union work but also intellectually engaged and familiar with anarchist and Marxist theory. And syndicalism did add up to a theory, as opposed to a miscellany of more or less loosely constructed propositions on strategies, tactics, and ideology.

To those who were attracted to the syndicalist project, parliamentary democracy and working for reforms through the state were rejected as dead ends. Instead of the statist conception of socialism introduced *from above*, syndicalists insisted that society’s revolutionary transformation necessarily

had to come *from below*, to be the work of the majority, the product of workers' own self-activity and self-organization at the point of production.

Hostility to the conservatism, bureaucracy, and corruption of the socialist party and trade union bureaucracies encouraged an emphasis on the collective "direct action" of workers on the *economic* terrain—with the subordination of all political action to the industrial struggle and the complete independence of syndicalist bodies from all political parties. It followed that the traditional function of reformist trade unionism—struggling to improve wages and working conditions within capitalism through collective bargaining with employers—was regarded as inadequate. Instead, syndicalists campaigned in favor of reconstructed and class-based trade unions that would become militant organizations dedicated to the destruction of capitalism and the state.

They believed the road to the liberation of the working class lay through an intensification of the industrial struggle (involving boycotts, sabotage, strikes, and solidarity action) eventually culminating in a revolutionary general strike that would lead to the overthrow of the capitalist system and its replacement by workers' control of industry and society. Unions would have a double function—as an organ of struggle against the employers on the frontline of the class struggle under the capitalist system and as an organ of economic and industrial administration after its overthrow.

During the first two decades of the twentieth century, amidst an extraordinary international upsurge in strike action, the ideas of revolutionary syndicalism connected with and helped to produce mass workers' movements in a number of different countries across the world. An increasing number of syndicalist unions, committed to destroying capitalism through revolutionary trade union struggle, emerged as either existing unions were won over to syndicalist principles or new alternative revolutionary unions and organizations were formed by dissidents who broke away from their mainstream reformist adversaries. This international movement experienced its greatest vitality in the period immediately preceding and following World War I, from about 1910 until the early 1920s (although the movement in Spain crested later).

Among the largest and most famous unions influenced by syndicalist ideas and practice were the *Confédération Générale du Travail* (CGT) in France, the *Confederación Nacional de Trabajo* (CNT) in Spain, and the *Unione Sindacale Italiana* (USI) in Italy. Syndicalism also became the rallying point for a significant minority of union activists in America, with the Industrial Workers of the World (IWW), and in Britain where syndicalism was represented within the prewar Industrial Syndicalist Education League (ISEL) as well as (in a more diffuse form) the leadership of the wartime engineering Shop Stewards' and Workers' Committee Movement. Other notable syndicalist unions and movements existed elsewhere in Europe, Scandinavia, and Latin America, as well as in Australia, New Zealand, South Africa, and Russia.

The heyday of syndicalism was maintained for only a brief period of 20 or so years. Its existence as a powerful and influential current inside the international trade union movement effectively came to an end with the ebb of the revolutionary workers' struggles that had shaken many countries in the immediate aftermath of World War I, which was followed by employers' and state-directed counter-mobilization and repression. The seizure of state power by Russian workers under the leadership of the Bolshevik Party, and the subsequent formation of the Communist International (Comintern) and its trade union arm the Red International of Labour Unions, also proved a decisive ideological and political challenge to the revolutionary syndicalist movement. Afterward, although it remained a residual force in Europe until World War II, syndicalism only survived as a pale shadow of its former self, being displaced partly by a rejuvenated social democracy (which succeeded in containing workers' discontent within established channels) and partly by the new revolutionary communist parties that were subsequently established and that were to rapidly supersede syndicalist organizations in most countries. There was only one important exception: a mass following was retained by anarcho-syndicalism in Spain during the Civil War of 1936–39.

Technology and Political Thought

Although connections of tool use to developing objective knowledge can be traced back to examples of *techné* (art or skill) in Plato, the political implications of technology were not examined until early modernity. Here they intertwined with the birth of the utopian imagination, the first significant text being the *New Atlantis* by Francis Bacon (1561–1626), published in Latin in 1624 and in English in 1627. In utopian fashion, the story imagines an island, Bensalem, centrally organized around Salomon's House, a community of researchers who use Baconian science to master nature, deploying their research to improve society by abundance, even creating synthetic plant organisms. Only the best and brightest can join Salomon's House, and it is hinted that the community has some privileges even over the state, thus, implying that Bacon's utopia is essentially a technocracy.

Bacon's work inspired the Royal Society's founding and has noteworthy wider political significance: He championed Enclosure Acts that replaced traditional complex bundles of access rights to commons with clean-cut private ownership, thus, helping usher in agrarian capitalism, and he justified this by claiming it enabled agricultural experimentation and so increased productivity. Bacon thus anticipated and influenced John Locke's later, betterknown arguments for the value of private ownership and scientific inquiry. However, considerable skepticism remained about the practical worth of scientific research, perhaps most famously expressed in Jonathan Swift's thinly veiled parody of the Royal Society within Book III

of *Gulliver's Travels*, "A Voyage to Laputa" (1726). It was not until the late eighteenth century, with the Industrial Revolution in full swing, that the association of scientific and technological advances with human moral progress was given its classic systematic expression by the French philosopher and mathematician Nicolas de Condorcet (1743–94) in his *Sketch for a Historical Picture of the Progress of the Human Mind* (1795). Condorcet argued for human improvement as a consequence of scientific progress, noting progression in nine previous historical epochs and suggesting indefinite continuity toward a utopian society.

The political significance of technology becomes much more clearly manifest in Karl Marx's 1845 manuscript *The German Ideology*. Unpublished until 1932, the work argues that different historical epochs are defined by the material structure of production in society, thus, giving a key role to technology in determining socioeconomic structure. Although critical of technology's role in alienation under capitalism, Marx nonetheless retained Enlightenment optimism about its liberatory potential, an optimism that twentieth-century neo-Marxians often rejected—thus, key Frankfurt school thinkers such as Max Horkheimer, Theodor Adorno, and Herbert Marcuse suggested ways in which technology is directly implicated in contemporary forms of domineering instrumental rationality and the commodification of human experience.

From a conservative political direction, a slightly similar critique of modern technology's capacity to enframe comes from Martin Heidegger's essay *The Question Concerning Technology*, and indeed all these thinkers have been invoked by the contemporary ecological movement. More recently, thinkers such as Albert Borgmann and Richard Sclove have suggested that technology in contemporary society has acquired a dynamic of its own—a "device paradigm" in Borgmann's model—which can subtly reduce rich experiential patterns to simple instrumentality and/or slowly subvert community life and democratic practices unless collectively regulated in a democratic manner. All such critics reject both simple technological optimism and the common view of technology as essentially value-neutral, although the debate between neutralists and non-neutralists continues to be central to the field.

Other thinkers such as Ivan Illich and Langdon Winner, although similarly non-neutralist while sensitive to phenomenology and direct experience, have focused on more clearly political ways that certain types of technology may imply, reinforce, or presuppose particular structures of authority and organization, as when railroads imply centralized management structures or solar panel technology implies options for local control of electricity. Most recently, the questions raised by new deep technologies such as biotechnology and nanotechnology have led to significant debates over the ontology of nature and artifacts and call for a revival of the pragmatist ethical tradition to deal with the radically new type of problems so generated.

Terrorism

Terrorism

790

793

Terrorism

Terrorism is the use or threat of violence or physical harm against persons in a way calculated to terrorize a group of people, with the hope that their terror will make it easier to achieve one's political goals. Hence, terrorism is not an ideology but one kind of political tactic or way of trying to achieve political goals. This entry addresses in turn the history of the concept and the current philosophical disputes about it.

History

The word *terrorism* and the concept of terrorism first entered general use in the 1790s during the French Revolution's Reign of Terror. The concept may have first been used by the Revolutionary Jacobin government to proudly describe its policy, implemented during 1793 and 1794, of terrorizing the population into submission with hasty show trials and mass executions of "enemies of the people." However, the concept was quickly adopted by the Revolution's enemies, such as Edmund Burke, as a neutral label for the tactic. Soon thereafter, people began to think that the word *terrorism* could acceptably be used as a term of opprobrium, such that any act counted as terrorism if it was violent, if it aimed to promote fear, and if the word-user disapproved of either the violence, the fear-promotion, or the goals these aimed to achieve. This sense of terrorism, which we could call "terrorism in the opprobrious sense," looms large today.

In the nineteenth century, certain political groups in Europe and the Americas proudly described their methods as terrorist. Some groups of anarchists, socialists, syndicalists, and nationalists proudly adopted terrorism as a means of drawing attention to how thoroughly, they thought, their society violated the demands of justice. They usually did so by assassinating political personages. Thus, they targeted state governments as well as society at large, demonstrating that terrorism can also be a weapon the weak can use against the powerful.

At the same time, and partly inspired by these self-described terrorist acts, “terrorism” acquired a new sense that has shaped discussions of terrorism down to the present. In this sense, an act is terrorist if it uses or threatens some *prima facie* wrongful sort of violence to spread fear as a way of achieving political goals. We may call this phenomenon “terrorism in the wrongful-violence sense” because it implies that terrorism is, on its face, always wrong. Of these conceptions, the most popular and plausible holds that terrorism necessarily uses or threatens violence toward innocent persons or non-combatants: We may call this “the innocent-persons conception” of terrorism. Because directing violence at innocent persons is *prima facie* wrong, terrorism on this conception is always *prima facie* wrong. This conception implied that the question of whether anarchists’ or syndicalists’ assassinations of political figures were *prima facie* wrong turned on whether these officials were innocent persons or instead suitably culpable for the injustices the terrorists were challenging. Many debates in the late nineteenth and early twentieth century over the justifiability of such terrorism were carried out in roughly these terms.

The twentieth century might be called “the century of terrorism” since during its course terrorism came to be deployed by both state and nonstate groups on an unprecedented scale. Many parties in the civil war after the Russian Revolution sought to terrorize populations into submission. The Bolsheviks, upon their victory, established a political police whose chief tool was terrorism: They persecuted all opponents of the party and persecuted nonopponents at random, with the clear aim of terrorizing the people into submission. These methods would enthusiastically be adopted by the political police of Fascist states and other totalitarian regimes, prompting Hannah Arendt’s famous remark that “terror is the essence of

totalitarian domination” (1973, 464). They were also used, albeit in a more secretive and targeted fashion, by the authoritarian governments of South America’s Southern Cone in the dirty wars of the 1970s and 1980s.

States also conducted terrorism by the new method of terror bombing of cities. The tactic of carpet bombing a city, with the aim of terrorizing its population into surrender, was pioneered by the Luftwaffe’s Condor Legion against the town of Guernica in the Spanish Civil War. The tactic was quickly adopted by all sides in World War II, not least by Allied bombers against Axis cities. Indeed, the U.S. atomic bombings of Hiroshima and Nagasaki could well be called the most successful terrorist acts in history since they terrorized the Japanese people into immediate and unconditional surrender.

Nonstate terrorism also flourished during the twentieth century. The Irish Republican Army, the Palestine Liberation Organization, the Popular Front for the Liberation of Palestine, the Baader-Meinhof Gang of Germany, the Red Brigades in Italy, the Zionist Stern Gang of pre-Israel Palestine, and the African National Congress all performed well-publicized terrorist acts. At the same time, the innocent-persons conception of terrorism had by the 1970s become perhaps the most popular conception of terrorism. As a result, the slogan “one man’s terrorist is another man’s freedom fighter” became widely used. For where one person would call a violent act “terrorism” because it targeted persons he or she deemed innocent, another would reject that label out of the belief that the targets were suitably responsible for the evil the alleged terrorists complained of.

In response to nonstate terrorism, states both retaliated with violence and formed counterterrorism organizations. This strategy gave rise in the 1970s to a statist counterterrorism discourse that has gone from strength to strength, a discourse that has created a new sense of the word *terrorism*. In this sense, although nonstate groups can perform terrorist acts, the state and officials acting on its orders never can: We may call this “terrorism in the free-pass-for-states sense.” U.S. federal law enshrines this sense: U.S. Code Title 22, Section 2656(f), defines terrorism as “premeditated, politically motivated violence perpetrated against noncombatant targets by subnational groups or clandestine agents.” This definition implies that state agents can

never commit terrorism as part of their publicly acknowledged work for the state. If anything, this sense of “terrorism” has become only more popular after the events of September 11, 2001.

Philosophy

Two main questions now roil the philosophy of terrorism. The first is conceptual: What exactly is terrorism? The second is moral: When, if ever, would terrorism not be absolutely wrong? The first question is logically prior because how we answer it will shape how we answer the second; but it is not clear that how we answer the second question will shape how we answer the first.

There are, broadly speaking, two schools of thought about the conceptual question. One maintains that only wrongful-violence conceptions can adequately answer the question: Its proponents tend to argue that genuine terrorism always necessarily targets innocent persons or noncombatants. The other school denies that the use or threat of violence must be *prima facie* wrongful because of whom it targets or how it is performed: All that is needed, they maintain, is that the violence try to further political goals by trying to produce terror. These have usefully been labeled “narrow” and “wide” conceptions of terrorism, respectively.

What hangs on the choice between the narrow and wide conceptions? Chiefly, it is a question of how high we should set the bar that a terrorist act must clear in order not to be absolutely wrong. The narrow definition sets that bar higher since it holds that terrorism uses or threatens (1) violence in a *prima facie* (2) wrongful way to (3) promote fear. The wide definition sets it lower since it holds only that terrorism uses or threatens (1) violence to (2) promote fear. Narrow-conception theorists argue that their view allows us to distinguish morally between political assassinations (not terrorist) and airliner bombings (terrorist) and between shock-and-awe precision bombing of military targets (not terrorist) and carpet bombing of cities (terrorist). Wide-conception theorists argue that their view makes better sense of the uses to which the concept has been put historically, and that because it is more morally neutral than the narrow conception, it can address the moral question with less baggage. This argument is the wide-conception theorists’

underlying motivation for rejecting narrow conceptions. Such conceptions, the argument goes, fixate our attention on the query: Were the targets of the used or threatened violence suitably responsible for the alleged evil the potential terrorists wish to avert? If the answer is “Yes,” then the next query is as follows: In exactly what way was each target suitably responsible? If instead the answer is “No,” then the act was *prima facie* wrong, and debate then either stops or shifts to the following query: Was the badness of targeting these innocents outweighed by the goodness of averting the evil attributed to the terrorists?

In either case, we are impeded from focusing directly on the following question: Just how bad is the evil the terrorists complain of, so that they would use this shocking means to avert it? For if we answer “Yes” to the narrow-conception query, this question does not arise. But if we answer “No,” then the question arises only in a perfunctory way since it arises as only one part of a costs-versus-benefits problem. The problem’s structure encourages us to give a hasty and perfunctory answer to the question so that we will never have a good and complete answer to it. But without a good answer, we cannot clearly see what justice there is in the terrorists’ complaints. We are then unlikely to make reasonable accommodation for whatever is just in the alleged terrorists’ complaints and will likely decline to give good reasons against alleged terrorists with unjust complaints. Either way, the alleged terrorists will justifiably think that we refuse to listen to reason and so will have additional grounds for continuing to use terrorism. In sum, the trouble with narrow conceptions is that they encourage an endless cycle of violence and complacency about real evils. Wide conceptions, by contrast, lead us to examine the roots of terrorist violence and to be mindful that there may be real evils we have not hitherto perceived.

On the moral question of terrorism, contemporary philosophers tend to agree that the important issue is as follows: When, if ever, would terrorism that targets innocent persons or noncombatants not be absolutely wrong? A few philosophers, such as Stephen Nathanson, argue that terrorism in this narrow sense is of necessity absolutely wrong either because absolute civilian immunity from violence is the moral rule that best promotes everyone’s interests in this domain or, as Nicholas Fotion has argued,

because violence against innocents is necessarily wrong unless there is no morally less costly alternative, and there is always a less costly alternative than violence against innocents.

Other philosophers, such as Virginia Held, argue that terrorism against innocents is sometimes not absolutely wrong. From one view, against-innocents terrorism is not absolutely wrong if and only if there is widespread violation of the human rights of one group *X* by another group *Y*, if the only way of stopping the violations and ensuring universal respect for human rights is terrorism against innocents, and if the innocents are members of the advantaged group *Y*. From a stricter view (e.g., Michael Walzer), against-innocents terrorism is not absolutely wrong if and only if it is the only way of averting an imminent danger that something “immeasurably awful” will occur. From an equally strict view (e.g., Igor Primoratz), against-innocents terrorism is not absolutely wrong if and only if there are very good grounds for deeming it the only way of preventing or stopping genocide or ethnic cleansing.

Thoughtful people bitterly dispute terrorism’s nature and morality. But one proposition is undisputed: There are no easy answers when it comes to terrorism.

795

Thoreau, Henry David

Henry David Thoreau (1817–62) detested love of wealth and its pursuit. His work and life are dominated by this principled aversion. The reasons for this aversion are several. A life obsessively devoted to wealth and its pursuit brings recurrent dissatisfaction, which shows itself in “quiet desperation.” This desperation can be assuaged only by the love of nature and the disposition to appreciate it for its beauty, indefatigable fecundity, and complex intricacy. But the economic life blocks perception of nature and narrows attention to exploiting it and often ruining it. So that if there is a great inherent but unappreciated cost when one commits oneself to economic life with frenzied passion, and if the further cost is an inevitable stultifying indifference to nature appreciated for its own sake, there is yet another lamentable effect: blindness to the evil that exists amidst organized social and political life. Even where there is no active commission of evil, there is acceptance of its material and psychological benefits or at least complacent acquiescence in it. For Thoreau, slavery is evil, the essence of evil. In its dehumanization of millions of people, it shows how far the unscrupulous love of wealth and its pursuit can go; its constitutional enshrinement compounds the evil and makes the whole free population accessories to it, while bringing down on the antislavery movements, which after all represent only a small minority of the country, savage opposition or deep dislike. Thoreau’s indictment of the love of wealth and its pursuit is the key to understanding his relentless and thoroughgoing critique of

society. He finds its aesthetic impoverishment infuriating and its moral degradation abhorrent.

In his most famous work, *Walden* (1854), Thoreau says that when human institutions are submitted to a “true gaze,” they “would all go to pieces in your account of them.” This applies to “a meeting house, or a court-house, or a jail, or a shop, or a dwelling-house.” All of them are at best makeshift, the scenes of unhappiness, mistaken assumptions, and hypocrisy. The one human relationship Thoreau unequivocally praises is friendship, about which he writes at length in his *Journal* and in *A Week on the Concord and Merrimack Rivers* (1849). Friendship can end in disappointment, but it is the one bond that is potentially an expression of genuine freedom and equality. Indeed it is the one kind of love that Thoreau writes about with positive feeling. But it is the go-getting and indeed rapacious economic system that Thoreau deplores above all. A key to his sense of the drive behind it is found in his formulation that people in their pursuit of wealth are “determined to be starved before they are hungry” (*Walden*). Of course, love of wealth is in part love of the goods, the greater convenience, comfort, and sensory exploration that wealth brings. Thoreau does not always find it easy to disparage these goods consistently. But in the great majority, there is a possessive overloading as well as a refusal to take seriously the imperative: “simplify, simplify” (*Walden*). The will to feel starved when one is possessed of assured sufficiency shows that one sees in ever more wealth a sign of mastery of the world or, at the least, a mastery of one’s own part of the world. Yet there is no evidence that the quest for mastery can ever be satisfied by definitive conquest. As a young man of 20, Thoreau hopes that the “bright side” of the excesses of avarice is evidence that “man will not always be the slave of matter” (“Commercial Spirit,” 1837); but with maturity, Thoreau lost belief in the bright side. Enslaving nature is not the answer to being enslaved by matter. Not only are there the perpetuation and expansion of slavery and the conquest of Mexico, but the California gold rush, the description of which in “Life without Principle” (1854) rivals Herman Melville’s characterizations of brutal selfishness. Thoreau says that the prospectors “turned into demons” looking for gold and devastating nature in the process.

Thoreau's supreme affirmation is not humanity but nature (a word he often capitalizes, as if to divinize it). *Walden* is a portrait of a young man trying to get as close to nature as possible and to imbibe the wisdom he detects in it. He lived in a hut he built by Walden Pond from July 4, 1845, to September 6, 1847. Thoreau's most exquisite writing on nature is found in *Walden*, but much of the *Journal* (14 volumes) consists of detailed descriptions of countless natural phenomena; these descriptions add up to a powerful display of his capacity for attention and for the painstaking effort to articulate his impressions. Thoreau finds in nature not just prettiness but also innocence and wildness, which for him are nearly synonymous terms, and the adequacy of every creature and plant to its niche and function, and the ability of everything nonhuman to be at one with itself. If we think, however, that nature at Concord is too benign to be a true test of character, too easy to like, we should recall that in the "Ktaadn" section (1848) of *The Maine Woods* (1864), Thoreau is overwhelmed by sublimity (not mere beauty) and almost made speechless by standing alone at the top of a mountain and experiencing matter in itself, the matter under and around him, as "vast and drear and inhuman," that is, as always alien and not to be encompassed by human concepts. Even the matter of which his body is made becomes alien to him. And in *Cape Cod* (1865), he exposes himself to the sublimity of the great ocean, "naked Nature, inhumanly sincere, wasting no thought on man," and to the human, not quite fully human, life built improbably on sands.

Thoreau as a philosopher of the conduct of life—to borrow a phrase from Thoreau's inspiration and neighboring genius, Ralph Waldo Emerson—has exerted tremendous influence on his readers, especially from the late nineteenth century to the present. Leo Tolstoy, Mohandas K. Gandhi, and Marcel Proust all admired him. His influence as a specifically political philosopher has also been great and results from a mere handful of essays and lectures. He teaches the politics of resistance. Opposition to slavery is the *raison d'être* of all his political thinking. His most famous political essay, "Civil Disobedience," was published in 1849 as "Resistance to Civil Government," which is arguably the better title. Thoreau is not consistently teaching nonviolence in that essay, let alone in two other brilliant later speeches, "Slavery in Massachusetts" (1854) and "A Plea for John Brown" (1859). To be sure, after he refused to pay the annual poll (head) tax in

1846, he accepted his punishment, not knowing beforehand how long he would be imprisoned. (He spent only one night in jail because apparently an aunt paid the tax for him.) He used no force or weapon in protest or to resist arrest. He hoped that his disobedience would provoke many others to disobey on his grounds, namely, that the Mexican War was a war of aggression at the behest of the slave power and that the whole Union, including the supposedly free state of Massachusetts, was dedicated to the preservation of slavery. To justify nonviolent disobedience of the law, he appeals to conscience—that is, the ability not to overlook the obvious fact that slavery is an enormous evil. But in “Slavery in Massachusetts,” he advocates forcible resistance to the official effort to send a runaway slave (Anthony Burns) back from Massachusetts to his owner in the South. His plea for John Brown is an unqualified defense of violent resistance to the institution of slavery. All three pieces are compressed utterances of political morality and deserve to be read and reread as long as political theory is studied. They, too, show his genius.

801

Tocqueville, Alexis de

Alexis de Tocqueville (1805–59) burst onto the intellectual scene in 1835 with the publication of the first volume of *Democracy in America*. He has never left it. Today the two volumes of *Democracy* (volume two published in 1840), and his book on the French Revolution, *The Old Regime and the Revolution* (1856), are considered masterpieces. Regularly translated into many languages, often the subject of commentary, and constantly cited in newspapers and magazines as well as scholarly publications on both sides of the Atlantic, Tocqueville is a central figure in contemporary political thought. As much as anyone, he has become the master thinker of our democratic era.

Biography

Tocqueville was born to an old French aristocratic family. His parents had barely escaped the guillotine in 1794 during the French Revolution's Terror. After the Bourbon Monarchy was restored in 1815, his father Hervé de Tocqueville served the new government, and the young Alexis de Tocqueville attended law school and served briefly as an unpaid assistant prosecutor. He read widely, particularly in seventeenth-century French classics and the authors of the eighteenth-century Enlightenment. He would later write that there were three writers he always carried with him, Blaise Pascal, Charles-Louis Montesquieu, and Jean Jacques Rousseau. He also attended the lectures of the great historian and later Prime Minister François

Guizot, whose approach to studying social questions influenced him profoundly.

In 1830, the Bourbon monarchy was overthrown and replaced by the July Monarchy of King Louis-Philippe. Unlike his father and brothers, Tocqueville took the loyalty oath demanded of public officials. Finding the atmosphere uncomfortable, he obtained leave to go to America with his friend Gustave de Beaumont to study the American prison system. The 11 months they spent in America from 1831 to 1832 resulted in a long study about prisons. More importantly, it resulted in *Democracy in America*. The book was a huge success when published in 1835, and Tocqueville was hailed as a “modern Montesquieu.” In the same year, over the objections of his family, he married Mary Mottley, a middle-class Englishwoman six years his elder. The marriage was childless. On the strength largely of his literary reputation, Tocqueville was elected to the French parliament in 1839 and remained there for the rest of his political career, which lasted until 1852.

Tocqueville was not a successful politician. His public speaking was limited by a weak voice, an early symptom of the tuberculosis that would eventually kill him. He was dissatisfied with the political parties of the era but failed in his effort to create a new one. When the Revolution of 1848 overthrew the July Monarchy and replaced it with a republic, Tocqueville was upset at the event but nevertheless found the new political environment favorable to his personal success. For five months in 1849, he was Minister of Foreign Affairs, but loyal to constitutional government, he opposed the coup d'état of December 1851 that brought Napoleon III to the throne in 1852. He was briefly imprisoned during the coup and then released. From 1852 until his death in 1859, he retired from active participation in political life although remaining as active an opponent of the Second Empire as possible without incurring exile or imprisonment.

In political retirement, Tocqueville turned again to writing to influence his country. He wrote a memoir of the events of 1848, the *Recollections*, intended for posthumous publication. To speak to his contemporaries, he turned his attention to the great event of recent history, the French Revolution. *The Old Regime and the Revolution* was intended as the first of

two volumes, but progress on the second was interrupted by his death in 1859.

Major Works

Democracy in America

Democracy in America has often been called the best book ever written about the United States. It is full of brilliant, often-quoted perceptions of American society and politics. But *Democracy in America* is first a book about democracy. America is its setting, not its subject. Tocqueville paid careful attention to America because America was the closest thing to a pure example of democracy in 1835. In many respects, it still is, and this is one reason for the enduring fascination of Tocqueville's work.

What is democracy, according to Tocqueville? It is two things: a social state and a political system. Democracy is a social state in which people are considered equal. *Democracy in America* is a book about what life is like when people live their lives surrounded by people they consider in principle to be no better or worse than themselves. In democratic societies, people may not have the same endowment of money, brains, or beauty, but they expect to be treated as everyone else's moral and legal and social equal. They are subject to the same laws, and their souls are presumed to be of equal worth in the eyes of God. Difference is the exception, not the rule, and must be justified, whereas in an aristocratic society, the opposite of a democratic one, difference is the rule, and it is equality that is the exception and requires special justification. Tocqueville was obsessed by democracy because he realized that democratic social conditions were inevitably coming to France and indeed to the whole world. Tocqueville chose to write about America because it was the archetypal democratic society. Unlike Europe, it had never had an aristocracy.

Tocqueville was sure the future would be democratic—that is, egalitarian—but he was not sure it would be free. Freedom was Tocqueville's most important value, almost his religion. He was frightened of future societies in which everyone was equal but equally subject to despotic power.

Tocqueville went to America not only to study democracy as a social state but also to study how democracy could be combined with freedom—combined with what Tocqueville sometimes called “democratic institutions,” that is, democracy as a political form. The fact that the United States had remained free, that the 13 colonies had not degenerated into dictatorships, as France itself had done for some time after 1789, was central to America’s attraction for Tocqueville. He knew it was a question that mattered to the entire world.

The problem that confronted Tocqueville was that, in his view, people in democratic times love freedom, but they love equality even more. Equality is far more attractive than freedom to most people in democratic societies, he argued. It is hard for people to recognize, for example, that their long-term economic prosperity is a result of their political freedom, and easy for them to attribute prosperity to other causes. By contrast, it is easy to see when political freedom leads to short-term economic problems. The benefits of freedom are long term and its costs are immediate. People “want equality in liberty, and if they cannot have it, they want it still in slavery.” (The best translation of *Democracy* is by Arthur Goldhammer, New York, 2004. See p. 584.) Over the course of his life, Tocqueville slowly moved from optimism about the future of freedom to pessimism. In *Democracy in America*, he was, on the whole, an optimist, at least in the first volume.

In *Democracy*, Tocqueville explains the choice democratic societies face between despotism and freedom. He explores how American laws, institutions, and above all mores help preserve freedom. Most importantly, he shows what lessons America can and cannot teach other societies with different histories and cultures.

The first volume of *Democracy* (1835) is oriented toward American peculiarities. The second volume (1840) is more abstract, oriented more toward analyzing democracy in general. Commentators debate whether the two volumes are really two books, perhaps with contrasting conclusions, or a single, more or less coherent work. Tocqueville’s understanding of democracy did change over time, but like someone going up a spiral staircase, he kept circling the same core issues.

Some universal threats to freedom in democratic societies that Tocqueville identified in America were the tyranny of the majority, individualism, materialism, and centralization. He found remedies there too: association, enlightened self-interest, and religion. These threats and their remedies were relevant to all democratic societies even if they could not always be applied in the same way. Particular to America was slavery, which Tocqueville discussed at length.

The problem of the “tyranny of the majority” is one of the most famous that Tocqueville addressed. The problem is not that the majority rules—that is part of democracy. The problem is that in a democratic society, the majority is naturally omnipotent. Individuals have no means to resist it, slow it down, or moderate it. For example, according to Tocqueville, thought was less free in America than anywhere else on Earth even though there was no censorship. Majority opinion did the censor’s work. Individuals were threatened with both the tyranny of a democratic government, imposed from above, and the tyranny of a democratic society, imposed from below.

The remedy that the Americans had found to this problem, Tocqueville thought, was association. By joining together with others in groups formed for everything from building a new school to discouraging the consumption of alcohol, they acquired the power to resist tyranny. In Europe, governments often feared private associations as potential revolutionary bodies. But for Tocqueville, they were a bulwark of freedom. By allowing all kinds of associations to flourish, America found that they balanced one another and became a source of stability. Because America had free elections with universal male suffrage, no association could claim to speak for everyone and, thus, claim a right to replace the government. Instead, associations allowed Americans to express opinions that as individuals they would have been powerless to make heard. At the same time, it taught them about politics and about freedom.

Associations also helped to combat another threat that Tocqueville thought democratic societies faced, “individualism.” Tocqueville defined individualism as the tendency of people in democratic societies not to care about anyone except their own family and friends. When people are individualistic in this way, they are not selfish since they do care about

some other people, but they do not care about society as a whole. This mattered to Tocqueville because he cared about freedom, and he was afraid that individualists would not. What does a dictatorship matter to an individualist as long as it does not harm his or her family or friends? Apathy is the natural political state of the individualist. Associations, and the need to associate with others to attain personal goals, restrain individualism by encouraging people to care about their neighbors and their larger community.

Tocqueville saw “enlightened self-interest” as another remedy for individualism. Individualists care only about the education of their own children. But if they display enlightened self-interest, they will care about the education of all children in their school because that will affect their own children. They may even care about the educational level of her city or country, for the same reason. Enlightened self-interest has many of the same effects as virtue. It encourages people to join associations and to recognize that society as a whole matters to them. According to Tocqueville, enlightened self-interest was widespread in America.

Tocqueville also feared the tendency of democratic people to care about nothing but making money since money was the only means to rise in a democratic society, and people had no hereditary position to fall back on. People who only care about making money will not care much about freedom as long as tyranny does not disturb their work. If freedom disturbs their economic well-being, they may well be inclined to give up freedom. Tocqueville asked what could lead people to care about something other than wealth and thought that one answer was God. It is difficult to overestimate the importance of religion in Tocqueville’s analysis of *Democracy in America*. Partly this is because the idea that religion and freedom could be friends was surprising to Tocqueville’s French contemporaries, his intended audience, who usually saw religion, in particular the Catholic Church, as the ally of tyrannical governments. But for Tocqueville, religion was a necessary bulwark for freedom, especially in a democratic society. By helping people turn away from money-making and individualism, it provided essential support for freedom.

The fact that America allowed religious freedom, and that so many different religions flourished there, helped counteract the last and perhaps most persistent danger to freedom in democratic societies, centralization. Tocqueville approved of centralized government in some things, like foreign policy. But he feared a central government that controlled everything, roads, police, education, and so on. It took freedom and initiative away from people and transferred it to some faraway place that they felt they could not influence. Centralization led to popular resignation, apathy, and eventually tyranny.

But association, enlightened self-interest, and religion, all widely found in American society, opposed centralization as they opposed those other threats to freedom in democratic society, the tyranny of the majority and individualism. Associations demanded local influence. Enlightened self-interest fought apathy. Religion emphasized a different source of authority. They were remedies for democracy's ills, and they were themselves eminently democratic, or at least not antidemocratic. They were also examples of the power of *mores*. By "mores" Tocqueville meant a people's intellectual and moral state. Mores, for him, were more important than laws or political institutions. The mores of Americans were those of a democratic people who had never known aristocracy. Even more importantly, they were those of a free people.

But in one way American mores were not those of a free people. America practiced slavery, and for this, neither the Americans of 1835–40 nor Tocqueville had any remedy. Tocqueville opposed slavery and worked to abolish it in the French colonies. But Tocqueville thought that in America, the white population's racial attitudes would lead to hostilities, if not civil war, between whites and blacks if slavery were abolished—a forecast that to some extent came true after the American Civil War when abolition was followed by many decades of systematic suppression of the civil rights of the ex-slaves and their descendants.

America, for all its virtues, was thus by no means a paradise for Tocqueville. Not all the remedies for democracy's ills found there could be applied elsewhere since other countries had different histories that, for example, made complete freedom of political association more dangerous

than in America. But America nonetheless pointed the way forward to a future in which freedom and democracy could be combined.

France was unable to follow that path, at least not in Tocqueville's lifetime. After Napoleon III's coup d'état, Tocqueville wrote *The Old Regime and the Revolution* in an effort to understand and explain why.

The Old Regime and the Revolution

The Old Regime and the Revolution is a continuation of the story Tocqueville had already told in an America setting, the story of democracy and freedom—but this time with an unhappy ending. Its themes are often familiar to readers of *Democracy*. In *The Old Regime*, Tocqueville is still preoccupied with the effects of centralization and contrasts its history in France with its history elsewhere. Other concerns of *Democracy* reappear although sometimes altered. For example, the concept of individualism is transformed: Rather than emphasizing the individualism and materialism of isolated persons, *The Old Regime* portrays the collective individualism and isolation of classes. Instead of talking about how religion supports freedom, *The Old Regime* analyzes why freedom and religion are perceived as mortal enemies in France. Tocqueville thus continues to examine the relationship between democracy and freedom, but in the French context the relationship becomes largely negative.

This conclusion was devastating to Tocqueville. Finding an explanation for it, and ideally a way to reverse it, is at the heart of his enterprise in *The Old Regime*. Tocqueville never pretended to be interested in the past for its own sake: “I admit that in studying our old society in all its aspects, I have never entirely lost sight of our modern society” (Kahan translation, Chicago, 1998, 86).

The Old Regime and the Revolution concentrates on how France evolved from the late middle ages, and especially the seventeenth century, to the decades before the French Revolution began, traditionally on July 14, 1789. (Tocqueville planned to write a second volume that would have started in 1787 and run through the Revolution proper, but he did not live to complete it.) The “old regime” was the name by which the last two centuries of the

monarchy were known. Tocqueville's book was about the relationship between the French Revolution and French history, and what that history meant for France's future.

In *The Old Regime*, Tocqueville challenged much conventional wisdom about the Revolution. He argued that its goal “Was Not, As Has Been Thought, to Destroy Religion and Weaken the State” (p. 96). Nor was it some sudden or even peculiarly French development. The French Revolution was the culmination of a centuries-long process that had taken place throughout European society, the gradual replacement of aristocracy by democracy—in the Tocquevillian sense of democracy as an egalitarian social state. Why did the Revolution that revealed this social change first happen in France? In what way was the French Revolution the result of France's particular history and culture, and what was the result of the progress of democracy?

Part of the answer was that the French Revolution was a long story, much longer than most people realized at the time or later. This is known as the “continuity thesis.” In the most well-known example, Tocqueville described how over centuries the French had centralized their state, how the government had done its best to discourage association and encourage individualism and materialism to maximize royal power. The French nobility had ceased to govern, ceased to be a real aristocracy, and had become merely a caste with hereditary financial privileges, hated by the middle classes, who themselves possessed privileges that made them hated by the peasants. The government encouraged class divisions to increase its own power. While others had attributed French centralization to the Revolution or to Napoleon, for Tocqueville, it was a long story, one in which the Revolution was but the final stage. Both left and right were offended by the continuity thesis in Tocqueville's time, and have often been since, but the thesis has gradually gained acceptance.

The continuity thesis answered the crucial question, “Who killed French freedom?” by blaming the monarchy and its ministers above all. But the monarchy was not the only culprit, in Tocqueville's view. The aristocracy, the bourgeoisie, and the Catholic Church all bore guilt as accomplices, all too ready to trade away freedom in return for material or spiritual

privileges. The urban poor and peasantry were innocent but no less crippled—they could not help adopting many of the mores of the classes above them, ideas and feelings that if not hostile to freedom, left them little prepared to exercise it.

There is one other group Tocqueville singles out for blame for the Revolution's failure to bring about a free society in France: the intellectuals. As democracy progressed, it was natural that people should develop ideas that favored equality. But the ideas of French intellectuals went well beyond this. Cut off, like the rest of the French population, from any real political experience because the government forbade participation, they espoused general ideas that made little or no allowance for the actual social and political situation of France. Their ideas were ideas suitable for encouraging a revolution but not for ending one. As a result, they contributed greatly to the alternation of anarchy and dictatorship that took place during the Revolution and culminated in what Tocqueville saw as Napoleon's despotism.

The intellectuals' ideas were important because they were the dominant ones in late-eighteenth-century France, and this gave rise to another difference between France and America, the different relationship between democracy and religion. In America, democracy and religion were allies. In France, they were perceived as deadly enemies. The intellectuals disputed the Church's intellectual domination, and since there was only one Church, intimately linked with the Crown, the cause of democracy became attached to anticlericalism. Into the vacuum left by Christianity rushed a new religion, a secular religion, the religion of revolution. It was this religious fervor that made the French Revolution into a European and worldwide event, rather than merely a French one.

Nevertheless, the revolution was not made simply out of a combination of resentment and desire for equality. There was also a real desire for freedom in France in 1789, which produced the Declaration of the Rights of Man and the Citizen of 1789, a great document of freedom, in Tocqueville's view. The problem was that the old regime had prepared the French much better for equality, and had accustomed them much better to despotism, than it had taught them how to maintain their freedom. Unlike the Americans,

most of their mores inclined them in the wrong direction. The French knew how to make revolutions but not how to be free. In *The Old Regime*, Tocqueville was pessimistic about the future of freedom in France.

Tocqueville Today

At the beginning of the twenty-first century, Tocqueville's reputation and influence are at their height among both historians and political scientists. In America, he has always been and remains a landmark. In France, Tocqueville's reputation has followed a more checkered path, but Tocqueville has now become almost as omnipresent on the French scene as on the American. Tocqueville's ideas have become central to the way both America and France understand themselves as well as to many contemporary understandings of democratic society. Beyond his easy quotability, beyond the decline of Marxism, there is a reason why Tocqueville is popular today. Tocqueville's attempt to understand democracy is what makes him so valuable to thinkers and politicians alike. His discussion of the threats to freedom in democratic societies, and the remedies to those threats, has proved to be of lasting interest in the postcommunist world.

Even if he would not always agree with their interpretations of his thought, Tocqueville would certainly not have objected to contemporary efforts to adapt his work to the task of encouraging freedom today. Chief among these efforts is perhaps his discussion of the role of private associations in promoting freedom in democratic societies. Through the idea of association, Tocqueville is central to modern discussions of "civil society," those aspects of society independent of the state and of religion. Indeed, he would have felt deeply flattered at the relevance of his ideas. But flattered as he might be, it is hard to imagine him being any less concerned today than when he died in 1859 for the future of freedom. Insofar as Tocqueville has remained relevant, it is because we too live in a democratic world where the future of freedom is not assured.

Toleration

Toleration

801

804

Toleration

Toleration is the attitude and corresponding conduct that allow for the peaceful coexistence of conflicting views and ways of life within the same society. According to the standard definition in the current philosophical debate, toleration means noninterference with practices, actions, and views of some people that the potential tolerator objects to and has the power to obstruct. Circumstances for toleration are thus differences of opinions, lifestyles, and practices:

which are *disliked* by the potential tolerator
which are considered *important* both by the potential tolerator and by the potential tolerated (otherwise we have *indifference*)
about which the potential tolerator possesses *power of interference* of some kind (otherwise we have just *acquiescence*)

Toleration occurs when agent A objects to conduct x of agent B, and has the power to prevent B from doing x , but nevertheless refrains from intervening for some reason(s). The nature of such reasons may be (1) prudential, such as the preference for peace over conflict or the political convenience of forbearance over repression; (2) epistemological, such as a skeptical argument about the truth of religious and moral convictions, or the value of pluralism; and (3) moral, such as respect for other persons and for their choices and integrity. When the reasons for noninterference trump or exclude the reasons for objecting to conduct x , then toleration follows. For

toleration to be a value, though, some further conditions are required, concerning, first, the reasons for dislike and, second, the limits of toleration:

1. The dislike, which is the primary precondition for toleration to occur, should concern, on the one hand, objects that are not improper to disapprove of in the first place, and, on the other, objects that are not categorically wrong. If the dislike concerns, for example, race, ethnicity, or sexual orientation of someone, that is, ascribed or inherited traits that cannot be changed, then overcoming one's distaste is not an exercise in toleration because there are good moral reasons to think that disapproval in this case is unjustified; in this case, the right thing to do is to review the racist or homophobic attitude rather than to become a tolerant racist. If, by contrast, the object of disapproval belongs to the class of what is universally condemned and categorically wrong, such as homicide, torture, or sadistic actions, then suspending interference would be a culpable indulgence, for in this case being tolerant would infringe on the rights of others. Toleration, therefore, is an appropriate response when we are experiencing a justifiable dislike of something that lacks universal (or virtually universal) condemnation.

2. Toleration is, then, a value within limits, beyond which it turns into culpable indulgence; traditionally, limits to toleration have been devised in the self-defense of political order (John Locke 1685) and in considerations of harm to others (John Stuart Mill 1859).

The Difficulties of Toleration

From this standard definition, some problematic features of toleration can be easily detected: (1) its ambiguous meaning between the negative notion of "putting up with" and the positive one of "acceptance"; (2) its paradoxical nature: From a moral point of view, it is not clear why accepting or even putting up with practices that one finds objectionable and contrary to one's convictions is a good thing rather than moral weakness or hypocrisy; and (3) its problematic political value: Toleration may promote social peace, but is it also the right way for democratic regimes to deal with social differences? Is it sufficient for treating everyone as an equal citizen?

Perhaps toleration is an outdated ideal, no longer suitable for contemporary democracy, despite the persistence of intolerance.

As to negative versus positive toleration, toleration always means noninterference: What changes are the reasons supporting noninterference. If the reasons are simply prudential, then toleration is a compromise; if they are epistemological, the value of toleration is only instrumental and the original disapproval negatively affects the tolerated; in both cases, toleration carries a negative connotation. If, by contrast, the reasons for toleration lie in respect for persons, noninterference becomes positive: The principle of respect, being a superior moral principle, trumps the reasons for disapproval. In this situation, respect for others, based on the capacity of persons to decide for themselves, excludes that disapproval between moral partners and peers, unless the behavior is seriously harmful to others. In this way, respect also makes *reciprocal* toleration possible.

Finally, as to the political value of toleration within contemporary democracy, some considerations are in order that take us back to the history of the doctrine of toleration.

Political Toleration: From Absolutism to Democracy

The standard definition definitely applies to horizontal toleration, that is, toleration expressed between two social agents or parties within the social and moral community. May it apply to vertical toleration as well, that is, to the political dimension? Does political toleration include the judgment of the state in suspending an objection to certain practices for various reasons—for example, by the state's tolerating an unpopular group? Or is such judgment out of place for political authority? The answer depends on the type of state under consideration.

In an absolutist state, where the doctrine of toleration originated, the practice of toleration by the absolute monarch with reference to his or her subjects was patterned after the standard definition. As a response to religious pluralism engendered by the Reformation, the arguments for

toleration varied from the preference for peace over war, to the impossibility of forcing the true faith, but basically toleration was endorsed because it was more politically convenient and less costly than violent repression (John Locke 1685). When adopted, toleration was a matter of political expediency, dependent on the discretionary and gracious decision of the sovereign, not on justice. On the one side, there was the king or queen, the potential tolerator; on the other, there were the dissenters. The former as a rule judged deviant creeds as false and heretical and had the power to suppress it. Yet a monarch could become convinced that tolerance was a more convenient solution than a costly war; in such circumstances, toleration was precisely the suspension of the repressive power of the state, the absolute sovereign, for the sake of peace.

When the liberal state was established, though, toleration was transformed from an act of grace of the sovereign into the universal rights of liberty of citizens (Thomas Paine 1791). At that point, the absolutist political principle and the social virtue of toleration part ways. Before liberalism, the king had good reasons for noninterference; within liberalism, the state has a duty to tolerate, corresponding to the right of conscience of citizens. Moreover, toleration enlarges its scope: not just freedom from persecution, but equal liberty of conscience. In brief, the political principle of toleration establishes the state as the (relatively) neutral arbiter among the different views and opinions of its citizens, granting equal liberty for all.

Liberalism, however, has not miraculously produced a social harmony of all differences in terms of religion, morality, ways of life, and so on. Freedom of expression and association tend to nurture pluralism rather than uniformity—and pluralism cherished as a liberal value requires horizontal tolerance. If political tolerance grants individual liberty, social conformism may put pressure on individuals and curtail their effective freedom to choose for themselves. In his highly influential treatise *On Liberty*, John Stuart Mill (1859) stressed the new danger of oppression coming mainly from public opinion, from the tyranny of the majority. For this reason, horizontal toleration has become a crucial element for individual liberty to prosper, liberty that the state should protect.

Toleration and Contemporary Pluralism

The political principle of toleration prescribes institutional neutrality concerning the many differences of contemporary pluralism, and makes horizontal toleration a duty, within the boundary of the harm principle. It might seem that controversial issues of toleration, such as “hate speech,” are preempted or ignored and that only trivial interpersonal questions are bound to arise. But many controversies have proved otherwise, for instance, over the toleration or banning of Muslim girls’ wearing the traditional hijab scarf in French public schools, over the helmet for Sikhs, or over ritual animal slaughtering by Asian immigrants to the United States. Such political conflicts, resulting from contemporary cultural pluralism in our globalized world, have engendered a new attention to the theory of toleration. Within the contemporary debate on toleration, three strands of reflection can be identified: (1) philosophical works exploring the concept of toleration, its conditions, justifications, and limits, with the tools of advanced philosophical analysis; (2) political works in the liberal tradition, addressing toleration as the political principle allowing pluralism and liberal society to coexist; and (3) political studies advocating an extension of the meaning of toleration in positive terms.

The first two lines of inquiry revisit the traditional concept of toleration, both in its horizontal dimension, as social virtue, and in its political dimension, as a political principle. The third kind of works proposes a reinterpretation of toleration concerning why toleration is still a problem in democratic regimes and whether its meaning needs to change. This reinterpretation focuses (1) on cultural differences represented by groups that are marginalized, oppressed, or excluded from democratic society, typically immigrant groups or internal minorities and on why they are disliked by sectors of the majority; and (2) on the public spaces that should or should not be made available for these groups’ expressions of their cultural difference. Where, for instance, should Muslim-Belgian or Muslim-American citizens be permitted to enforce their own *sharia* law? In contemporary questions of toleration the issue is not the suppression of religious creeds and the repression of dissenters as in the times of Locke or Voltaire. Liberal toleration of religious freedoms and personal liberties is nowadays taken for granted in Western societies. Rather, in legal terms, the issue becomes one of the permissible “time, place, and manner” in which cultural differences may be publicly expressed. Few want to convert

Muslims to Christianity; yet many contend that Muslim symbols, be it the hijab or the mosque, should be confined to private areas instead of “invading” the symbolic landscape of Western societies.

Consequently, toleration comes to mean a spatial and symbolic enlargement of the liberal notion: from private to public space, and from negative to positive meaning. This revision of liberal toleration, also labeled “toleration as recognition,” aims at the legitimation of different practices and traditions belonging to minority groups in the public space, so as to reverse the public exclusion of their bearers. The public recognition of minority differences as legitimate options within liberal society does not imply any positive evaluation, let alone endorsement, of such differences but simply the removing of double standards according to which minorities are restricted in their freedom of expression in public while majorities have no such restriction. This more positive meaning of toleration moves, therefore, from mere noninterference with beliefs and private practices to public recognition and respect for cultural difference. Toleration expands in this way toward granting equal respect to all members of society, whether belonging to the majority or the minority.

Tolstoy, Leo

Lev Nicolayevich Tolstoy was born September 9, 1828, at Yasnaya Polyana 120 miles south of Moscow, and died November 20, 1910, at the nearby railway station of Astapova. Already famous as a novelist, in the last 30 years of his life, he became equally famous as an ascetic and as a Christian anarchist, although he did not use those terms.

His vision is presaged in his diary for March 1855 as a “colossal thought”: “to establish a new religion, . . . the religion of Christ, but purified of belief in mysteries, a practical religion, one that does not promise a future bliss, but one that brings such harmony on earth.”

This task he undertook after a spiritual crisis recorded in *A Confession* (1879). Here he tells how the failure of science and metaphysics to give any reason or guidance for living almost drove him to suicide. Suicide was only avoided by the adoption of faith that “gives an infinite meaning to the finite existence of man.”

Obedience to God meant obedience to Christ’s teaching, especially that given in the Sermon on the Mount. Its essence was the “supreme law of love”; “supreme” because it is unconditional. To Tolstoy this law of love is not merely one virtue among many or some personal moral guide; the “increase in love” is the only basis for a “permanent revolution” in society.

Similar to his American contemporary, David Lipscomb (1831–1917), Tolstoy abjures politics. In Section 3 of *The Law of Love and the Law of Violence* (1908), he writes:

The essence of the mistake of all political doctrines, from the most conservative to the most advanced . . . lies in the fact that the people of this world . . . consider, that it is possible, through violence, to unite people in such a way that everyone submits, without resistance, to the same structure of life and guidance for conduct that results from it.

In *The Kingdom of God Is Within You* (1893), Tolstoy notes that communist and socialist reformers intend to carry government interference even further to regulate economics and private life. All reformers he writes are under the delusion that when a brutal and oppressive government is overturned, such violence and oppression will no longer be needed. In fact, Tolstoy argues, the rule of all revolutions is that the next regime is worse since it must continually defend itself from those it has overcome. In Tolstoy's view, Pierre-Joseph Proudhon and Peter Kropotkin were right in everything but in their method of violent revolution. It was incomprehensible to Tolstoy that violence can make others behave the way we want them to.

The law of love outlaws force of all kinds. Thus, Tolstoy rejects the State (as a conspiracy founded on force to exploit and corrupt), the courts (that punish), the military (that kills), and the authority of "Church Christianity" (that "hypnotizes" the masses with colorful but irrelevant mysteries, miracles, and rituals). Tolstoy was excommunicated from the Russian Orthodox Church in 1902.

Tolstoy rejects the idea that not to resist evil is unnatural. No one, he says in *What I Believe* (1884), likes to see cruelty to animals let alone to humankind. The few leaders who direct mass killing in war do not themselves kill, but others, compelled by an oath of obedience, do the killing for them.

For Tolstoy the tragedy of the West is that it adopted a religion whose supreme law is love but kept its opposite, the pagan coercive political

structure, which society now considers absolutely necessary and inevitable. As a result, Christianity was corrupted by its service to the State and is now so far ossified that religion itself is being rejected along with the moral restraints that come with it. In this situation, coercion and violence, now aided by technology, can only get worse.

Tolstoy had long regarded private property in land as iniquitous and at the heart of the agrarian distress in Russia. To make land available to the peasants and to ensure that each stood in an identical relation to its advantages, Tolstoy eventually modified his strictures against the State to include the “single tax” teaching of the American social philosopher and economist, Henry George (1839–97). However, as he makes clear in his last novel, *Resurrection* (1899), rather than apply it to the nation as a whole, Tolstoy applied the “single tax” to the village commune. In *A Great Iniquity*, banned in Russia but published in *The Times* in London (1905), Tolstoy expresses his exasperation at the urban intelligentsia who seem prepared to adopt any political reform while denying “that which alone the Russian people require—the liberation of the land from private property [and] the establishment of equal rights on the land for all men.”

Tolstoy was prophetic. Arrested under the tsar, Tolstoyans continued to be arrested after the Bolshevik coup, either for refusing to take an oath to defend the State or for “not teaching in accordance with the government programs.”

However, Mohandas K. Gandhi, who had corresponded with Tolstoy in 1910, would apply his teaching successfully in campaigns of civil disobedience or *satyagraha* (“truth force”) against British rule in India.

806

Tönnies, Ferdinand

Ferdinand Tönnies (1855–1936) is considered one of three principal founders of the discipline of sociology at the end of the nineteenth century in Germany, alongside Max Weber and Georg Simmel. Born and educated in the German-Danish border region of North Frisia, near the city of Kiel, to which he maintained a lifelong connection as a professor there until 1916, Tönnies is celebrated chiefly today as the author of *Gemeinschaft und Gesellschaft*, first published in 1887 (translated into English as *Community and Society* in 1957).

Co-founder of the German Sociological Association in 1909 (and President of the Association in the 1920s), Tönnies originated a way of thinking about modern social and political change in terms of the disappearance of traditional “communal relations,” based on more or less continuous face-to-face interaction between family members and kin groups in close-knit agrarian and small-scale urban craftsmanship communities. These informal relationships came to be replaced by the rise of “societal relations,” based on more or less discontinuous, impersonal, abstract exchange relationships between individuals as providers of anonymous services and commodities. Echoing Henry Maine’s earlier distinction between “status” and “contract” as well as Lorenz von Stein’s theory of social class formation—and generally paralleling Karl Marx and Friedrich Engels’s analysis of capitalist wage labor contracts (without sharing their normative program)—Tönnies’s opus is the first major work of social commentary to define modern attitudes to life in terms of an experience of processes of functional

differentiation among interrelated components of social organization—a conception refined in the 1890s by authors such as Simmel, Weber, and Émile Durkheim and in the 1930s and thereafter by Talcott Parsons, his student Marion Levy, and others. After World War I, Tönnies's book spoke to a mood of industrial alienation and disarray, of moral disorientation and displacement, to a sense of the “desert of the asphalt,” and to a longing for escape from fragmented utilitarian orders of existence—a mood also captured by Oswald Spengler's *The Decline of the West* of 1918. The reality of life in modern times, Tönnies observed, was irreversibly one of separation of public and private spheres; of professionalization, functionalization, individualization, and bureaucratization; of rules of formal quantitative equivalence across all spheres of life; and of the predominance of forms of purposive-rational will (or *Kürwillen*, as Tönnies called it) over more substantial sources of social-ethical self-understanding. However, this condition, Tönnies insisted, was not necessarily to be denounced as one of unbearable vacuity and degeneracy. The ills of modern technological civilization could be addressed and mitigated by social and political reform, even if not abolished by it. Social democracy, as a project of rational administrative organization of market economies on the basis of equity, solidarity, and social justice, could rationally reconstruct values of community and collectivity for modern times.

Besides *Gemeinschaft und Gesellschaft*, Tönnies also published a number of other, rather neglected treatises in social and political analysis. Tönnies was the first to discover and edit Thomas Hobbes's *Elements of Law, Natural and Politic* of 1640 after a visit to the British Library in 1883, seeing in the thought of the English philosopher the rudiments of a sociological theory of the bases of national and international order—and one that Tönnies also believed could be reconciled in principle with more normative Kantian conceptions of freedom of the moral will. In 1897, Tönnies also published a study of the popularity of Friedrich Nietzsche as a European cultural and intellectual totem, and in 1922, in *Kritik der Öffentlichen Meinung*, Tönnies completed a wide-ranging examination of “public opinion” or “publicity” (*Öffentlichkeit*) in historical-sociological perspective as a possible horizon of realization for eighteenth-century Kantian ideas of the “free use of public reason,” defining public opinion as the regulating cognitive force in a world of *Gesellschaft* that takes the place

of religion in the world of *Gemeinschaft*. Remarkably, this work anticipates by some 40 years Jürgen Habermas's much better appreciated *Structural Transformation of the Public Sphere* of 1962.

Long an opponent of the paternalistic monarchical authoritarianism of the German Wilhelmine Empire, Tönnies passionately supported the Hamburg dock workers' strike of 1896–97, and although he succumbed to nationalistic statements at the outbreak of World War I (like many others of his milieu), he emerged during the Weimar Republic as one of the most outspoken champions of legal universalistic causes and of the legitimacy of the government of the Social Democrats in particular. After 1930, he was by far the loudest and most courageous of opponents of the Nazis among non-Jewish German bourgeois professorial figures of the period, publishing impassioned pleas on behalf of the German Social Democratic Party (*Sozialdemokratische Partei Deutschland*, SPD) throughout the events of 1932 and as late as February 1933 (aged 78) reading out a manuscript on freedom of speech at a meeting of socialist activists in Berlin that was broken up by the Nazi brownshirts.

Totalitarianism

Totalitarianism

806

810

Totalitarianism

Totalitarianism is a term developed in the twentieth century to capture the essence of a new kind of political regime opposed to the pluralism of liberal democracy. The term was first used, in Italy, when applied to Benito Mussolini's fascism. After the end of World War II, which revealed the horrors of Nazism, and the start of the Cold War, which soon brought to prominence horrors under communism, the term was harnessed by both political theorists and political scientists for more general application. Although the predominant tendency is to synthesize a common concept from these various works, and certainly, there is agreement on some points, important disagreements remain. It is agreed that the general term—totalitarianism—applies to pervasively authoritarian regimes both of Left and Right and that it depicts a new phenomenon which has arisen only in modern times. Totalitarianism is viewed as crucially different from the autocratic rule (whether as tyranny, despotism, or absolutism) of earlier times and a phenomenon that could occur only after the rise of mass democracy and modern technology. Nazi Germany and Stalin's Soviet Union are generally viewed as the paramount examples, although there are differences in opinion over the other cases, if any, to which the term can be applied. This disagreement follows from the controversy over the precise meaning of the term, and it is a dispute that also has a bearing on contentions over the nature of terror and the purpose for which totalitarianism developed.

First Uses

The description “totalitarian system” (*sistema totalitaria*) was first used seven months after Mussolini’s March on Rome in October 1922 by a prominent opponent of fascism, Giovanni Amendola, when writing in the newspaper *Il Mondo*, in May 1923, in rejection of the proposed changes to the election laws. The changes, which became law later that year, gave two thirds of the seats in the Chamber of Deputies to the political party that received the largest share of the votes cast in a general election, if it received a minimum of 25 percent of the total number of votes cast. The claimed aim of the new law was to end coalition governments, but Amendola saw it as a fundamental attack on the representative system, an attack on legal opposition and on pluralist opinion. The term *totalitarian* was quickly taken up in various anti-Fascist publications: the word “totalitarianism” itself first appearing in print on January 2, 1924, in *La Rivoluzione liberale*. Under the penname Prometeo Filodemo (Prometheus People-lover), a young socialist, Lelio Basso, decried the “undifferentiated totalitarianism” under which the structures and institutions of the state—the monarchy, the parliament, the law, the armed forces—“are becoming instruments of a single party that makes itself interpreter of the people’s will.”

The turn from totalitarianism’s being used as a term of abuse came in 1925. In June of that year, Mussolini, in a speech delivered at the Fourth Congress of the Partito Nazionale Fascista, used the term not in criticism but in praise of the National Fascist Party’s “fierce totalitarian will.” Just two months previously, Giovanni Gentile, the Hegelian philosopher recruited to the Fascist Party in 1923 and generally viewed as the first philosopher of totalitarianism, had begun to spin the word. Gentile brought the State and individual will together, as one: In so doing, he squeezed out Hegel’s “civil society” and the family. In 1932, in “The Doctrine of Fascism,” published under Mussolini’s name in the *Encyclopedia italiana*, Gentile wrote of the “all-embracing” nature of the fascist conception of the State outside of which “no human or spiritual values can exist, much less have value,” and he added: “Thus understood, fascism is totalitarian.”

The irony of the term beginning life as a criticism of an antiliberal state and later being employed in praise of the all-embracing fascist state is matched by another irony. The case of Italy, rather than being accepted as a classic case, is at the heart of the contentions over the meaning and application of the general concept of totalitarianism.

Totalitarianism as a General Concept: Contending Positions

The contending views of totalitarianism essentially derive from a fundamental disagreement over whether totalitarianism is carried out through the state or from behind a state façade. These contrasting positions reflect the critical divide set by Hannah Arendt in *The Origins of Totalitarianism* ([1951] 1958), who takes the behind-state view, and Carl J. Friedrich and Zbigniew K. Brzezinski in *Totalitarian Dictatorship and Autocracy* ([1956] 1965), who take the through-state view. Among those taking the through-state position, there is some contention over whether it is the dictator's leadership or the single mass party that should be given the greater emphasis. Of those stressing the party, one departs in viewing Jacobin rule in France, March 1793 to July 1794, as a case of "totalitarian democracy." Those taking the behind-state position take the view that totalitarian government differs not only from the tyrannies of earlier times but also from modern dictatorships of any kind.

Arendt and Friedrich and Brzezinski share the position that totalitarianism is an entirely new political form, a twentieth-century phenomenon for which modern technology and mass participation are indispensable. Although the two works are alike in taking Nazi Germany and Stalin's Soviet Union as the classic cases of totalitarianism, Arendt restricts her view of totalitarianism to these two cases; totalitarianism is the totalitarian regime, the last stage of "totalitarianism in power." Mussolini's Italy she rules out, arguing that Mussolini developed a totalitarian movement but never went to this last stage, being "contented" with "dictatorship and one-party rule": ruled, that is, through the state. Furthermore, her classification of "totalitarianism in power" applies only to Nazi Germany from November 1938, marked by *Kristallnacht*, and in the Soviet Union from 1929–30 to

1953. For Arendt, the Soviet Union was not a totalitarian regime under Lenin or during the entire period of the New Economic Policy (NEP, 1921–28), and she acknowledges the “detotalitarianization” that took place after Stalin’s death, in 1953. In contrast, Friedrich and Brzezinski apply their concept of totalitarian dictatorship far more widely. They include the USSR under Lenin, Nikita Khrushchev, and Leonid Brezhnev (and so, logically, through to the fall of communism), Italy under Mussolini, the countries of communist Eastern Europe, Communist China, Cuba under Fidel Castro, and Ghana under Kwame Nkrumah.

The Contrasting Characteristics of Totalitarianism

It is Friedrich and Brzezinski’s six-point “syndrome” of totalitarian dictatorship that is the most widely known. Its six features are as follows: (1) an ideology of a utopian kind for the whole of the world, which justifies the use of violence; (2) a “single mass party,” led by the “dictator”; (3) a system of terror (physical or psychological) through party and secret police, used to generate fear in both actual and potential dissenters, its purpose intimidation; (4) a monopoly of mass communications; (5) a monopoly of weapons; and (6) central control of the economy (state plans).

The purpose of this syndrome is both to delineate the mutually reinforcing characteristics of an entirely new kind of political system (all six points are required) and to provide a scientific definition to be used for comparative purposes. Friedrich and Brzezinski also offer some lessons for the development of totalitarianism; it is not a causal explanation but follows through the idea of a syndrome as an illness that develops in stages. Essentially their argument is that ideology, which produces violence, gives rise to a totalitarian movement that in turn gives rise to a totalitarian party, which, becoming increasingly bureaucratized, takes control of the government (state) and sets up a totalitarian dictatorship.

Arendt’s view of totalitarianism, which predates Friedrich and Brzezinski’s work, contrasts strongly with their image of totalitarian dictatorship. Her position is that the totalitarian regime is not dictatorship in the sense of

through the state: single mass party, bureaucracy, regular army, regular police and secret police, plans, and laws. Rather, “real power” lies not in the institutions and organizations of the state, which has only “ostensible power” but behind the state façade, with the secret police operating independently within a secret society, the whole system characterized by lawlessness. Arendt also emphasizes the “shapelessness” of the system: multiplied offices and duplicated functions, even “fake departments” in Germany; overlapping party, state, and soviets in the USSR; and purges destroying rational coordination.

Furthermore, for Arendt, totalitarianism is not an ideological movement, at least not one based on a wholly new ideology. Rather, existing ideas and beliefs are exploited: Marxism-Leninism, racism (to include modern anti-Semitism), Pan-Germanism, and Pan-Slavism. The whole system, in her view, is based not on the leader’s decisions put into operation by the party intertwined with the bureaucracy and the state coercive forces but on the “leader principle” in which the attraction of the leader is his “prophetic infallibility” based on “systematic lying.” Again, in contrast to Friedrich and Brzezinski, she rejects propaganda as part of the developed totalitarian system, although it plays a role in its development: In the early stage, propaganda together with organization is used in developing the totalitarian movement and in setting up the terror system. Once the totalitarian regime is begun (1938 in Germany and 1930 in the Soviet Union), propaganda is only used for external consumption so as to continue the fiction of a normal state.

Again, in sharp contrast to Friedrich and Brzezinski’s stress on planning, Arendt rejects any functional relationship between totalitarianism and the economy. In particular, concentration camps and labor camps are viewed as anti-utilitarian. Concentration camps are, at one and the same time, the microcosm of the perfect totalitarian society (the secrecy and the perfectly obedient mass under the total domination of the secret police) and the central organizational power of totalitarianism. The “leader principle” is not a dictatorship making people (through the state) do what they do not want to do but total domination over a mass society in which people have been stopped from thinking.

At the heart of these strikingly different views of totalitarianism are contending views of the nature and role of totalitarian terror. For Arendt, its primary purpose is not violence aimed at dissidents to create fear for the purpose of intimidation, as Friedrich and Brzezinski argue; for her, totalitarian terror is directed deliberately at innocent victims. Attacking innocents is the means through which spontaneity is destroyed and perfect obedience achieved, people being stopped from thinking for the purpose of “total domination.” In line with her emphasis on lawlessness, innocents are those attacked without provocation: Terror strikes against people possessing characteristics that no change in their behavior can affect.

Origins and Development

Again in contrast to Friedrich and Brzezinski’s perspective on totalitarianism as a syndrome that develops through set stages, Arendt adopts a comparative historical approach to the “origins of totalitarianism.” As her view of Mussolini’s Italy clearly demonstrates, totalitarianism is not inevitable: It was once in power that Adolf Hitler and Joseph Stalin set about creating the conditions for totalitarian terror, through propaganda and organization. In reflection of her view that existing ideologies are exploited in totalitarianism, the “origins” start from an analysis of the existence of the right kinds of themes to be exploited in the generation of the totalitarian movement. She picks out “race-thinking,” which, she argues, stems from imperialism and is a new development that differs from anti-Semitism, which has a far longer history. Race, substituting for nation, she argues to have been one of the two devices of imperialism used to rule over foreign peoples with the other being bureaucracy, as government not through law but through decree. The difference between race and nation in this imperialist thinking is argued to be politically significant because it undermined the ideas of citizenship within the nation-state that had developed in Europe throughout the nineteenth century. In the “continental” (rather than “foreign”) form that it took in Europe, imperialism both developed the ideas to justify the denial of rights to people within a country and identified the peoples to whom such rights could be denied. Lacking colonies abroad, Russia and Germany, with their respective Pan-Slavism and Pan-Germanism, looked for what she terms “colonies on the continent.”

The result of the growth of the nation-state, which, while developing citizenship rights for some denied them to others, was the growth of “stateless” people whose numbers, crucially, escalated as a consequence of World War I and the postwar treaties that drew artificial boundaries. Drawing on her two themes of imperialism and citizenship, Arendt argues that a political system historically structured around a strong bureaucratic state will be the one best suited to a totalitarian leader: In such circumstances, nationalism is encouraged and class loyalties discouraged. In this mass society, where class allegiances have been destroyed, isolated individuals, seeking to belong, are ready to be mobilized by a totalitarian leader.

Post-1991

During the era of the Cold War, it was primarily Friedrich and Brzezinski’s political-science view of totalitarian dictatorship that held ground, and the term *totalitarianism* was widely applied to singleparty states and most especially to communist regimes. Arendt’s view was judged to be too heavily drawn from the case of Nazi Germany and to have too easily rejected the importance of the economy. The scale of the deaths of the victims of the early totalitarian dictatorships that provided so important a part in the impetus to employ totalitarianism as a general term, relaxed into a greater stress on psychological terror and brainwashing. Important questions about the objectivity and utility of the term were raised after the collapse of communism in Eastern Europe in 1989 and in the Soviet Union in 1991, and some even dismissed the concept as obsolescent.

In particular, some analysts point to the ideological use of the term *totalitarian* by anticommunist governments and ideologues to make their own favored, right-wing authoritarian dictators—such as the Shah of Iran, the apartheid regime of South Africa, and Anastasio Somoza in Nicaragua—look less oppressive than communist dictators. These critics of the totalitarian paradigm also suggest a key difference between aspirations to total power and the inherent limits on the actual power of all regimes. They note the almost timid implosion of the allegedly totalitarian regimes of the former Soviet Bloc.

Moreover, fresh evidence has revealed a clearer picture of the significant differences between the Eastern European countries and governments in the Soviet Union before and after de-Stalinization, begun by Khrushchev in 1956. It may be that in being stretched to reflect changes and used for ideological purposes, the concept of totalitarianism played a part in the failure to foresee the fall of communism. Indeed, it was only the rare social scientist, notably cultural anthropologist Charles Erasmus (1984), uncompromised by connections of regimes or ideologies, who predicted and explained the collapse, marketization, and/or transformation of the communist regimes in the Soviet Union and China.

Since 1991, Arendt's position on totalitarianism has moved more to the fore. Although her account of the origins of totalitarianism is fixed in a particular era of European history, her concept remains valuable in gaining understanding of the nature of the arbitrary, terroristic government in Cambodia under Pol Pot, April 1975 to January 1979. In general, whenever the exercise of total domination is attempted through the destruction of human plurality and spontaneity in various forms of individual and group diversity of opinion and behavior, then the concept of totalitarianism can continue to provide insight.

Trotsky, Leon

Lev Davidovich Bronstein (1874–1940), generally known by his adopted name Leon Trotsky, was one of the most romantic of Marxist revolutionaries, in part because of his compassionate identification as a youth with the workers on his father's estate. Trotsky was active in the 1905 Russian Revolution, and with Vladimir Ilych Lenin led the 1917 Revolution, was head of the Red Army, and became leader of the Left Opposition after the rise of Joseph Stalin, which led to his exile in Istanbul and Mexico City, where he was finally murdered by an agent of Stalin in 1940.

Trotsky was one of the most charismatic of revolutionary intellectuals in the twentieth century. There are two major phases in his thought. The first, early phase, up to 1917, is libertarian in content. Like Rosa Luxemburg, Trotsky before the 1917 Revolution believed that history was driven by the mass spontaneous energy of the masses. From 1917, when he joined forces with Lenin and the Bolsheviks, he viewed the Communist Party as the piston for which the proletarian masses provided the energy of steam. This way of thinking led to his later infamous motto, "my party, right or wrong"—a seed of the original, communist concept of political correctness, later appropriated with an ironic twist by conservatives.

The early Trotsky was a vehement critic of Lenin and the Bolsheviks, supporting the original soviets, or workers' and peasants' councils. After 1917, however, Trotsky became, in Lenin's words, the best of Bolsheviks,

authorizing the violent suppression of the Kronstadt mutiny, in which radical soldiers took their stand against the authoritarianism of the new Soviet regime and were slaughtered on Trotsky's command. The anti-Bolshevik Trotsky thus became ultra-Bolshevik after the Russian Revolution. From October 1917, he projected his personal identity onto the Revolution, from which his fate is no longer separable.

Trotsky's major works are many and varied. The theory of permanent revolution, pioneered by Alexander Parvus and Karl Kautsky but widely associated with Trotsky, spans the two main phases of his thought. First articulated in 1905, and elaborated in 1930, this theory indicates a double dialectic. First, according to Trotsky, the bourgeois revolution everywhere gives rise to the proletarian revolution. Second, all national revolutions develop into international revolutions. Trotsky was the greatest opponent of Stalin's slogan of "socialism in one country." Like other Bolsheviks, he insisted that the fate of the Russian Revolution depended on the success of the German Revolution, whose eventual success he presumed. Trotsky's thinking is animated by this kind of telos, whereby all roads lead to socialism. Yet he was also one of the most acute early critics of fascism.

Trotsky's thinking often contained contradictions. In 1920, for example, he published two books, *Terrorism and Communism* and *Literature and Revolution*. The first defended the militarization of labor, arguing in defense of coercion. The second waxed lyrical about the prospect of a new Faustian utopia in the Soviet Union, reconstructing both nature and human nature. *The Revolution Betrayed*, published in 1936, argued that the USSR was simultaneously an example of socialism (a workers' state) and a Stalinist betrayal of socialism. The Transitional Program of the Fourth International, 1938, simultaneously argues that the conditions for socialism are ripe and that the new Marxist party is the vital agent in the transition to socialism. The vital role of the vanguard party ran contrary to the inevitability of socialist revolution, Trotsky left two major legacies, which overlap. The first is intellectual. Many of the major Marxist thinkers and writers of the twentieth century followed Trotsky, both as a major historian and as an autobiographer and as a kind of halfway house for socialists in the face of Stalinism. Some, like Cornelius Castoriadis and Claude Lefort, broke with Marxist orthodoxy but remained radical. Others, like Christopher Hitchens,

became liberal or contrarian critics of Marxism. Yet others, like Isaac Deutscher, Ernest Mandel, Tariq Ali, and the founders of the *New Left Review*, remained more closely influenced by Trotsky's revolutionary Marxism.

The second legacy is organizational. Trotsky's broader influence extends through the various permutations of the Fourth International, some still influential, as with those that grew out of the International Socialists. Various Trotskyist groups have exerted influence in Latin America, Sri Lanka, much of Europe, and North America. Trotsky's revolutionary romanticism still attracts young radicals throughout the world. The aura of heroism and tragedy attached to his life and death remains, even if his politics remain connected to a world we have lost.

Twentieth-Century Political Thought

New developments in political theory have marked the twentieth century. So many and so diverse are the thinkers, in fact, that their contributions make sense only with reference to particular traditions regarding questions of political authority and social inequality. These two ideas lost the kinds of justification that they had retained in times past. Advocates of liberalism contested the divinely based notions of authority, and of the unaccountable exercise of arbitrary political power, as part of a tradition whose roots reach back to the Enlightenment and John Locke. But the ascendance of these two critiques during what R. R. Palmer termed “the age of democratic revolution” from 1688 to 1789, and then in the international turbulence of 1848, was predicated primarily on establishing the rule of law and the creation of a “watchman state” that would benefit the expansion of capitalism. This dual assumption left issues of social and economic inequality untouched both for the broad masses of working people in Europe and for the victims of imperialism in the non-Western world.

Liberalism has always rested on universal principles, such as the rule of law, which privilege the rights of the individual against the state and the community. Critics view this slant as corrosive of what Niccolò Machiavelli originally termed “civic virtue” or the willingness to participate in the life of society. Communitarians have charged that liberalism also fails to value the historically situated allegiances of political life, especially in the case of threatened cultures like the Inuit. Works like Michael Walzer’s *Spheres of Justice* (1983) and Benjamin Barber’s *Strong Democracy* (1984) call for

invigorating democracy through voluntary associations, neighborhood involvement, and a new concern with educating citizens in the traditions of their community. Other communitarians such as Charles Taylor have deepened related discussions about multiculturalism and have provided new insights into the nature of solidarity and the self as well as into the role of religion in consolidating authentic connections among individuals. Some thinkers, such as Richard Rorty, have gone so far as to privilege “ethno-solidarity” and a “civilized indifference” to other cultures, arguably at the expense of cultural pluralism and cosmopolitanism.

Most liberals around the turn of the twentieth century were preoccupied with civil liberties, free trade, and a secular outlook. They had little to say about the second industrial revolution and the rise of a massive industrial proletariat. Figures like Herbert Spencer and William Graham Sumner promulgated competition and put a moral judgment on “the survival of the fittest.” Liberalism thereby turned into the ideology of the bourgeois gentleman. There were exceptions like T. H. Green. His *Lectures on the Principles of Political Obligation* (1895) insisted that liberty remained incomplete so long as it did not begin “hindering the hindrances of the good life.” But such appeals in theory to a more positive concept of liberty were mostly ignored in practice. Most European liberal parties became content to dispense with a mass base and serve as power brokers. Only in the United States were things different. *The Promise of American Life* ([1909] 1965), by Herbert Croly, arguably the leading theoretician of progressivism, incorporated the idea of state action into liberalism along with many demands originally raised by the socialist movement, foreshadowing the economic programs of the New Deal in the 1930s. This undertaking anticipated the later distinction drawn by Sir Isaiah Berlin between “negative” and “positive” liberty. Especially in the United States, the earlier preoccupation of liberalism with the free play of market forces gave way to policies designed to stimulate demand and provide a safety net for working people. Or, to put it another way, the old emphasis on purely formal, or negative, freedoms was balanced by a new concern with substantive equality.

In Europe, however, liberalism surrendered its revolutionary character after the Revolutions of 1848. Late nineteenth- and early twentieth-century

liberals actually stood in uneasy alliance with a host of monarchical and dictatorial regimes. On the continent, the real-world successor to revolutionary liberalism was the socialist labor movement. It was inspired by a particular interpretation of the writings of Karl Marx and Friedrich Engels that sought to link the creation of a liberal republic with the elimination of economic inequality. Social democracy became a mass movement with a proletarian mass base. But its leaders were unprepared for the outbreak of World War I and the new totalitarian communist and fascist movements that opposed more traditional understandings of political authority and social equality.

Transforming the World

Each of these new movements—socialism, communism, and fascism—would ultimately become a unique expression of a distinctly new form of mass politics, and each of them would seek to make good on the interests of different combinations of classes and groups. The two new totalitarian movements competed with each other vehemently in the aftermath of World War I, and each castigated the other in theory despite their similarities in practice. Each viewed itself as revolutionary and opposed social democracy and the liberal republic either with the communist “dictatorship of the proletariat” or the fascist vision of a homogeneous national/racial community. Indeed, the battle between social democracy and its liberal allies, on the one hand, and these two totalitarian movements was neither illusory nor superficial.

Socialism

The “scientific socialism” of Marx and Engels gripped the working class during the last quarter of the nineteenth century. The theory was deterministic, positivistic, and teleological. But its claims appeared to correspond with reality. Everywhere in Europe, it seemed, an industrial proletariat was growing and organizing itself into the first democratic mass parties. Socialist theoreticians such as Karl Kautsky crystallized and popularized this vision of an international working-class movement on the rise with a politics that linked demands for economic reform with calls for

liberal republics to replace the monarchies then dominating Europe. In widely read works like *The Social Revolution* (1898) and *The Road to Power* (1909), Kautsky insisted that the “proletariat” would keep growing and bring about a new democratic revolution amid the crises and wars endemic to the capitalist system. Waiting confidently for the proletariat to become the great majority of society, and thus mitigate any future prospects of violence, revolution became the long-term goal justified by Marxist theory while reform in the shortterm marked the organizational practice of social democracy.

As the twentieth century began, however, Eduard Bernstein’s *The Preconditions of Socialism* ([1898] 1993) reached the conclusion that the proletariat was no longer growing. If democratic values were to be maintained, therefore, socialist activists would need to compromise with the political representatives of other classes and abandon guarantees of proletarian revolution. Socialism thus became an evolutionary enterprise based on the ethical commitment to bring about a liberal welfare state. But this argument of Bernstein’s was hotly debated. Rosa Luxemburg opposed such “revisionism” in *Reform and Revolution* (1898), and in various other works (Waters 1970), she offered new insights into the complexities of the mass strike as well as into imperialism and the authoritarian dangers of the Russian Revolution of 1917. Nevertheless, the attempt to justify reformist practice by revolutionary theory created bitter disillusionment and a sense of betrayal once socialist parties (now intent on becoming a “partner” in the capitalist/monarchist status quo) supported their respective governments with the outbreak of World War I.

Social democracy at its best was a libertarian movement of protest. None of its major figures would have questioned its commitments to economic justice, republicanism, and internationalism. They also believed that a new sensibility would mark what Oscar Wilde termed the “soul of man under socialism.” Technology used for the benefit of citizens offered a new world of leisure and contentment, which was portrayed by the best-selling utopian science fiction novel *Looking Backwards* ([1887] 1967) by Edward Bellamy, and the movement offered a new sense of dignity and purpose to the worker. Its members took seriously the democratic implications of the great phrase from Chapter 2 of *The Communist Manifesto* (1848), in which

Marx and Engels asserted that “the free development of each would serve as the condition for the free development of all.” The communists ultimately transformed this vision into its collectivist opposite during the 1930s by insisting that “the free development of all should serve as the condition for the free development of each.” This transposition crystallizes what is perhaps the most crucial difference between social democracy and communism. Leon Blum, the great leader of French social democracy, put the matter well when he spoke of a “moral incompatibility” between these two movements of the working class generated by the thought of Karl Marx.

Communism

Communism initially became widespread as a designation of political identity during the years preceding the Russian Revolution of 1917 when Lenin sought to differentiate his movement from social democracy. Already in his pamphlet *What Is To Be Done?* (1902), he insisted that if left to its own devices, the proletariat would always succumb to “economism.” Political consciousness therefore had to be injected into the working class from outside its ranks by a vanguard party of “professional revolutionary intellectuals.” In his view, the democratic mass party identified with European social democracy did not fit the conditions of an arch-reactionary and economically underdeveloped Russian Empire. He believed that a “party of a new type” was required with a centralized underground apparatus to overthrow the regime and bring about a bourgeois republic. If Lenin answered the organizational question regarding the prospects of revolution in a backward nation, however, it was Leon Trotsky who suggested that a “permanent revolution” might enable the working class to introduce its own form of governmental rule rather than remain content with the political form of its class enemy. The merger of these two ideas created the intellectual and practical foundations for bringing about the Russian Revolution with its slogan “all power to the soviets” and a party-stat embodying the “dictatorship of the proletariat.”

Utopian goals were generated in 1917–21 amid revolutionary turbulence in Europe and the shortlived attempts to create workers’ councils. Radicals in the communist movement such as Antonio Gramsci, Karl Korsch, and

György Lukács—also known as “Western Marxists”—called for abolishing alienation and the division of labor. Insisting on the fundamental connection between Marx and Hegel, they highlighted questions of class consciousness and cultural hegemony and envisioned the party’s aiding in the empowerment of the working class over its society. But such radicals constituted a minority within the movement, and with the failure of all European experiments in proletarian democracy, the Soviet Union was left as the only communist state. Once again worth noting is that the Bolshevik seizure of power was undertaken not in an economically developed capitalist nation with a large proletariat, as Marx and Engels had predicated, but in an economically backward nation that had barely moved beyond feudalism. Gramsci, indeed, termed the event “a revolution against *Das Kapital*.” That is precisely what made the communist organizational model so attractive to those engaged in anti-imperialist struggles. They played virtually no role in the conversation of theorists outside the socialist and communist traditions. Even now this topic remains marginal. *Imperialism* (1902), by John Hobson, the liberal socialist and teacher of John Maynard Keynes, argued that “parasitic” capitalist interests, unconcerned with the common good, fostered nationalism and militarism in order to achieve their imperialist ends. *Finance Capital* (1910), by the future Secretary of the Treasury in the Weimar Republic, Rudolf Hilferding, identified imperialism with the rising dominance of the banks over the capitalist system, while Rosa Luxemburg’s *The Accumulation of Capital* (1913) suggested that imperialism was endemic within capitalism—or, better, that capitalist nations required precapitalist territories to dump their goods and thereby create the incentive for reinvestment. Most famously, Lenin’s *Imperialism* (1918) saw “the last stage of capitalism” as having generated World War I, made possible the Russian Revolution, and shifted the potential for revolution from the Western proletariat to the colonized peoples.

The Soviet Union crystallized the problems facing non-Western and economically developed societies. Desperate measures were needed to industrialize the Soviet Union amid the rising fascist movements of the 1920s and to enable it to catch up with the West. Lacking an indigenous capitalist class, the party state wound up as the agent of modernization. As Lenin’s health declined before his death in 1924, Stalin took charge. Communism became identified with a party state in which terror, which

was initially directed only against explicit enemies of the revolution, was ultimately employed arbitrarily against everyday citizens. Thus, it was that the grand utopian experiment degenerated first into authoritarianism, then into totalitarianism, and after the death of Stalin in 1953, into a bureaucratic state lacking in revolutionary purpose and rotting from within—one that became subject to devastating criticism in a tradition of classic disutopian novels ranging from *We* (1921) by Yevgeny Zamyatin to *Animal Farm* (1940) by George Orwell and *The Trial Begins* (1960) by Andrei Sinyavsky.

Fascism

World War I was a “total war” that spawned fascism as well as communism. Both understood the outcome as a product of betrayal. Lenin and his comrades saw social democrats, imperialists, liberals, and remnants of the old order as the culprits who had led the working class to the slaughter. For the nascent fascist movements throughout Europe, it was the “defeatists” who now supported the liberal republics of the 1920s that had denied their nations the fruits of victory whether through what the Nazis termed a “stab in the back” or some other cowardly plots. Fascists everywhere fused xenophobia, and ultimately racism, with imperialist ambitions in an intractable one-party state. They, too, forged their own tradition of political theory. Various thinkers who anticipated fascism, such as Maurice Barrès, Charles Maurras, Houston Stewart Chamberlain, Eugen Dühring, and Richard Wagner, sought to obliterate the Enlightenment legacy of reason and inspire the masses with discipline and vitality, chauvinism, and racism, with an eye on exterminating what they considered the nation’s enemies: traditional liberals and conservatives, socialists and communists, and Freemasons and Jews.

Carl Schmitt, who shifted from being a conservative to a Nazi, understood authority as constantly under siege by “partisan” political enemies. According to his *The Concept of the Political* (1932), therefore, it must always mobilize “friend against foe.” This idea is seen as the foundation for all political thinking. Politics is not war by other means; rather, it employs the same means. Security cannot be achieved without action that may intrude on civil liberties—a necessary and justifiable compromise between the particular interests of citizens and the health of the state. The “will” of

citizens becomes manifest in the state, and the sovereign, or he who decides, manifests its ability to act in the world. The sovereign's ability to make a decision must subsequently remain unencumbered by checks and balances or any moral postulates associated with the liberal rule of law.

Fascism was an international phenomenon that achieved prominence in Austria, France, Germany, Hungary, Italy, Romania, Spain, and various other nations. Its parties were mass-based rather than mere puppets of big business or cliques of disaffected individuals. Its leaders, like Benito Mussolini and Adolf Hitler, were as intent on changing the world as Lenin or Trotsky. Fascists and their forerunners justified violence by insisting on the existence of a mythical national or racial conflict that often had its roots in the beginnings of civilization. Enlightenment rationality, liberalism, and Marxism denied or obscured the need for national or racial solidarity and what fascists considered the need for exercising arbitrary power in rooting out the enemy. Whatever their claims to the contrary, like the communists, fascists also had a military vision of the political party, relied on a “cult of the personality,” and ruled through a mixture of propaganda and terror. They, too, identified the party with the state and sought a rigid form of “coordination” (*Gleichschaltung*) that would unify all institutions under a single command. Both communists and fascists used masses to exterminate masses. The ideological inspirations for the two movements, their political theories, were surely different. Their members died fighting one another in the streets and, later, on the battlefields. But the political structure of their party organizations, their police states, and their styles—their paranoia, their music, their uniforms, their parades, their conventions—were remarkably similar.

The Totalitarian Temptation

Communism and fascism challenged the style of the old order. Neither had any use for its pragmatism, its humanism, and perhaps above all—ironically—its understanding of historical change. The totalitarians brought a new vitality to bear against their older rivals. Neither communism nor fascism had any use for universal ethical values or an “agent” of revolutionary change constrained by history. It is true, of course, that many of the worst crimes perpetrated by the communists were justified by reference to

“historical necessity,” and the Führer always spoke of “destiny.” With respect to communism, however, “necessity” was actually never anything more than an excuse, while for fascism, “destiny” was only what the leader wanted it to be. These movements in their most radical phases, and with respect to their most radical policies, never exhibited a sense of the way reality and ordinary morality might limit their secular-chiliastic ambitions and goals. Their leaders believed that, despite tactical retreats and opportunistic compromises, they could bend history to their will—and whether justified through teleology or a racial apocalypse, it only made sense that the masses should pay the price.

The Flight From Practice

Establishmentarian political theory saw ideologically motivated mass movements as the source of totalitarianism. Its liberal wing subsequently sought to highlight the need for a more rigorous and scientifically grounded understanding of politics while conservatives called for rehabilitating the canon to condemn the excesses of modernity. The focus was less on social justice than on individual liberty on the one hand and far more on interpreting the text than on analyzing the context on the other. The former stance can be understood as an offshoot of positivism, which essentially involves applying methods of the natural sciences to society, while the latter insisted on the continuity of concepts and ideas or, better, a narrow traditionalism. Both wings of establishmentarian-thinking liberals were suspicious of bureaucratic mass society as well as all systematic philosophical approaches to making sense of it. They both insisted that what would later be called “grand narratives” tended to become ideological props for mass movements, authoritarian parties, and overweening states. Interpreting the sources of political conflict and the imbalances of social power became even less of a priority. The study of politics was seen as requiring either scientific neutrality or intellectual contemplation. Thus, political theory sundered its connection with practice.

The Open Society

A new positivistic outlook subjected all forms of historicism, idealism, collectivism, and utopianism to withering criticism. Sir Karl Popper's *The Open Society and Its Enemies* (1950) found the rudimentary assumptions of the "closed society" in Plato and argued that they had been carried into the present through the pseudo-democratic radicalism—or in J. L. Talmon's phrase, "totalitarian democracy"—of Jean-Jacques Rousseau and, most crucially, the dialectical theories of Georg Wilhelm Friedrich Hegel and Marx. Works like *The Road to Serfdom* (1944), by Friedrich von Hayek, maintained that any form of state intervention compromised freedom and dignity, while Sir Isaiah Berlin's *Two Concepts of Liberty* (1958) juxtaposed attempts to impose communal understandings of freedom—or "positive" liberty—against the free exercise of conscience embodied in the liberal and antistatist notion of "negative liberty." Mainstream political "scientists" arguing their own brand of "pluralism" such as David Truman and Robert Dahl warned against privileging participation over order and seemed to justify apathy. At the beginning of the 1960s, it was popular to speak about what Daniel Bell termed "the end of ideology" and a new emphasis was placed on turning normative ideological questions into problems of public administration.

The value-free and supposedly nonideological presuppositions of social scientific reasoning, its pragmatic and "falsifiable" character, appeared to offer a sharp rebuke not only to the metaphysical dogmas of totalitarianism but also, by extension, to all normative theory. Some thinkers, such as the Canadian Christian Bay, criticized the attempt to limit political theorizing to the domain of what is testable by the methods of the natural sciences. They castigated positivists and behaviorists for refusing to deal with the basic speculative questions or the exploitation inherited from the past. They deplored the reduction of politics to a set of techniques and the way in which establishmentarian values crept into supposedly scientific research. Various political theorists concerned with reinvigorating democracy and the grievances of the "new social movements" contested the acceptance of civic apathy. But they were mostly on the outside looking in. Political "science" increasingly drew a sharp division between those who analyzed power and those who judged it.

Preserving the Canon

Fear of institutional manipulation and the abrogation of civic responsibility were widely shared concerns of those resisting the new scientism. It was also a matter of saving the canon of political theory from the incursion of modernity. Leo Strauss and his followers highlighted the ongoing “conversation” between magisterial authors—the “great men” of political theory—who comprise what amounts to a predetermined “canon” of political theory beyond time and space. Such a stance is predicated on the belief in what Karl Jaspers, the mentor of Leo Strauss, termed a “perennial philosophy” whose “traces” or “ciphers” (*Chiffren*) are in need of continual reinterpretation even though they manifest themselves in the great works of every civilization and unite them. Here a classical bias is evident from the start: The future always, and ineluctably, lies in the past. Leftist critics charge that insular approaches of this sort banish history and material interests in favor of imaginative reconstructions of texts. In the process, however, they consign political theory to a museum of the mind. The classics are insulated from the mob and, in culinary fashion, readied for the next Talmudic exegesis by yet another academic “aristocrat” or connoisseur.

In *What Is Political Philosophy?* (1959), Strauss called on political theorists to deal with classic texts less in terms of the relative truth or historical value they represent than as expressions of truth as such. He also viewed the entry of the secular, the critique of the transcendent, as a source of degeneration. Strauss abhorred the decline in “liberal education,” by which he meant education in a preestablished Western canon, and the increasing refusal to recognize the “authoritative” voices of the Western political tradition. The latter he saw as undermined by the relativizing tendencies of mass culture and mass education. Philosophy is essential for the breeding of a “gentleman,” according to Strauss, and conservative political theory must divorce itself from civic concerns to create and preserve an intellectual “aristocracy within mass society.”

Others took a different view. In widely read works such as *The Human Condition* (1958) and *On Revolution* (1963), Hannah Arendt looked back longingly to the polis, the town meeting, and even the workers’ council or democratic soviet. Her aim was to preserve politics from bureaucratic corruption and instrumental definition by highlighting the importance of participation by citizens. Yet she never confronted the concrete problems

associated with decentralization, such as the coordination of interests, patronage, provincialism, or the impact of markets. Her philosophical response to history was to identify politics with “speech” and a “self-exhibition” among equals in a public forum. “Real” politics thus became identified less with mass movements and institutional imbalances of power than with the ideal of participatory democracy with an eye on the polis, the soviet, or states’ rights. From this perspective, liberalism and nationalism, as well as Marxism and fascism, appear as “anti-political.” In *Politics and Vision* (1960), Sheldon Wolin condemned all four of these ideologies for their collusion with the state, their antiparticipatory character, and their suspension of what is “general and integrative to men, a life of common involvements.”

Metaphysics and Politics

From the first, Jürgen Habermas privileged the role of rational discourse for genuine democracy and, later, as a corrective to chauvinistic emotions, a form of “constitutional patriotism.” His first book, *The Structural Transformation of the Public Sphere* ([1962] 1989), highlighted the role of a public sphere that would protect the individual from the state and allow grievances to be aired. *Knowledge and Human Interest* ([1968] 1971), his next major work, maintained that all social knowledge was informed by a “generalizable interest” that would become apparent insofar as communication was “undistorted” by self-interest, propaganda, and imbalances of power. Such communication assumes an egalitarian recognition of others, a willingness to justify positions in a rational spirit based on good will, and an implicit commitment to ultimately accept the better argument beyond any specific set of material or instrumental interests. Habermas’s work highlights the vision of a public realm predicated on the unfettered exchange of ideas as well as on a healthy respect for the intelligence and moral capacity of everyday citizens.

In a somewhat different manner, John Rawls’s immensely influential *A Theory of Justice* (1971) set intuitively attractive notions of social justice in a framework of rational consent whose validity no supposedly reasonable person could conceivably reject. The foundation for this enterprise was the hypothetical “original position” in which individuals are stripped of their

material interests, history, and personal values to illuminate the moral values any self-interested person would accept. This logic is not dissimilar to what Thomas Hobbes employed in viewing a universal interest in survival as the precondition for the pursuit of all other interests. For Rawls, however, the result is a maxim whereby social policy is judged in terms of whether it favors the least advantaged member of society. In the “original position,” where each is cloaked by a “veil of ignorance” and no one knows what social situation he or she occupies, it would seem a matter of prudent self-interest for each to embrace this maxim. The “difference principle” subsequently assumes that any social and economic inequalities are arranged so that they can be expected to help all, with positions and offices open to all. The utilitarian self-interest in security becomes bound with the commitment to reciprocity on which ethical rationalism is founded. The result is a stance that identifies justice with fairness.

But the argument is built on a hypothetical form of judgment that is ultimately rooted in the liberal understanding of the social contract. There, too, an abstract judgment generated by self-interest (“rightly understood”) is rendered by individuals essentially stripped of their empirical characteristics. As far as justice is concerned, Rawls himself conceded in his next major work, *Political Liberalism* (1993), that the notion of justice as fairness is unrealistic. Disagreements over what defines social justice, the public good, and the character of morality are only natural given the number of reasonable, yet incompatible, competing doctrines. In this new work, therefore, Rawls attempts to identify the “ideal of public reason” with a stance whereby the claims as well as the rights and duties of citizens might be determined. An “overlapping consensus” defines what is common to all even as differences are preserved. Here, too, he insists that the foundation for a legitimate ordering of society rests on principles that no reasonable person can reject. Unfortunately, however, the same tautology presents itself: Liberal society presupposes the existence of liberal individuals. Nothing can be said about those who hold what have been termed “illiberal” views and interests. Ultimately, indeed, Rawls philosophically confronts this problem in his unfinished work, *The Law of Peoples* (1999), where he notes that in international relations, it is less a matter of any given people being “liberal” than being “decent.” But there is an extent to which this entire discussion rests on semantics. The argument

rests on intuitively generated ideal types that are immune from any historically critical assessments or conflicting interests regarding the character of decency. There is no consideration of how imbalances of institutional or international power are constituted. Little concern is given to social solidarity or a theory of resistance. It is enough to render the politics intelligible through metaphysics.

New Reactions

World War II and the shock of Auschwitz and the Gulag produced a new concern with critical reflection on modern bureaucratic social structures and the exercise of individuality. Totalitarianism and the emergence of an authoritarian personality, preoccupied with “obeying orders,” produced a new critique of accepted categories and assumptions as well as the responsibility to uncover the totalitarian and barbaric roots of modernity. This extended to the experiences of colonial subjects under imperialism as well as the palpable need to confront anti-Semitism along with racism, sexism, and homophobia. Critical theory, existentialism, and poststructuralism all served to confront the old justifications for imperialism and prejudice. Each after its fashion was deeply skeptical about metaphysics with its universal ambitions, foundational claims, and unexamined biases that supported existing structures of power. These new approaches also crystallized mostly unacknowledged forms of alienation, mistrust of cultural authority, as well as the integration of the revolutionary proletariat and the passing of historical agency. Intractable tensions between humanity and its works became a prominent theme along with a new emphasis on subjectivity as the radical response to totalitarianism and what would later become a conservative backlash.

Critical Theory

Confronting “traditional” theory in both its positivist and metaphysical forms required a new conceptual framework: “Critical” theory supplied it. Associated with what became known as the “Frankfurt school,” the term was first coined in 1937 by Max Horkheimer while he and most of his colleagues were in exile in the United States. Two of his seminal essays

explained the unique character of his approach: “Traditional and Critical Theory” and “Materialism and Metaphysics.” Horkheimer insisted that critical theory should be understood neither as a philosophical system nor as a fixed set of proscriptions. He instead viewed it as a method of liberation, a cluster of themes or concerns that would express an explicit interest in the abolition of social injustice and the psychological, cultural, and political reasons why the international proletarian uprisings failed after the events of 1917 in Russia. Works like these set the stage for a new mode of “dialectical” thinking—a version of Marxism that went beyond economic determinism to deal with totalitarianism, the failure of the proletarian revolution, and mass society in an interdisciplinary manner.

Most notable in this regard was *Dialectic of Enlightenment* (1944), written by Horkheimer and his stalwart and brilliantly multifaceted friend Theodor W. Adorno. This work questioned the virtues of progress, science, and modernity. It maintained that by privileging mathematical reason, the Enlightenment not only assaulted reactionary forms of religious dogma but also, whether intentionally or unintentionally, critical reflection. Capitalism with its attendant employment of scientific rationality and bureaucracy was seen as stripping the individual of both conscience and spontaneity ultimately culminating in the number tattooed on the arm of the concentration camp inmate. Stalinism on the left, Nazism on the right, and an increasingly bureaucratic and robotic mass society emerging in the United States had also seemingly eradicated the prospect of revolutionary transformation. Buttressed by a “culture industry,” which always targets the lowest common denominator for its products, opposition becomes just another commodity while critical thinking and genuine subjectivity are imperiled. Not the philosopher or the political revolutionary but the bohemian intellectual, who challenged society in its entirety, now embodied whatever liberating hopes existed for the future.

But modernity and the eighteenth-century Enlightenment were not the only culprits. Civilization itself had rendered genuine individuality problematic from its beginnings: Ulysses was already forced to hide his identity in order to survive. *Dialectic of Enlightenment* thus introduced an anthropological perspective to highlight the demand for conformity and the subversion of subjectivity. Politics thus made way for a philosophico-aesthetic assertion

of critical reflection in *Negative Dialectics* ([1966] 1973) and *Aesthetic Theory* ([1970] 1997), two monumental works by Adorno, while Horkheimer emphasized a philosophical-religious understanding of resistance in *The Longing for the Totally Other* (1970). Thus, critical theory sought to combat the collectivist strains within advanced industrial society by infusing historical materialism with a new emphasis on the role of subjectivity.

Existentialism and Identity

Still, it was existentialism that truly marked the culture of the postwar era. With their emphasis on authenticity, personal responsibility, and solidarity, Albert Camus, Jean-Paul Sartre, and Simone de Beauvoir became intellectual superstars. Their concern with individuality and facing the “absurd” (an existence without predetermined meaning) fit a time defined by what was known as the “concentration camp universe.” In literary works like *Caligula* ([1944] 1958) and *The Plague* ([1947] 1948), and his major foray into political theory, *The Rebel* ([1951] 1954), Albert Camus confronted the terror justified by the utopian ambitions of totalitarian regimes through articulating the ethical limits on action and the importance of exhibiting a plausible connection between means and ends. As for Sartre and de Beauvoir, they sided (for a time) with the Soviet Union during the Cold War. Nevertheless, their insistence on taking responsibility for one’s situation and personal authenticity also led them to anticipate what would become a new emphasis on identity.

Sartre led the way with *Anti-Semite and Jew* (1948) and his great existential biography of the gay writer Jean Genet, while Simone de Beauvoir intellectually launched the modern women’s liberation movement with *The Second Sex* ([1952] 1953). Inspired by such works, later studies by Carole Pateman, in *The Sexual Contract* (1988), and by Charles Mills, in *The Racial Contract* (1997), made clear how the most basic assumptions of liberal society ignored these marginalized groups. So it was that both the intellectually radical perspective of W. E. B. Du Bois and the confrontational approach of Martin Luther King, Jr., faulted U.S. institutions for failing to live up to their own liberal and egalitarian promises. Likewise, after co-founding second-wave feminism in the 1960s,

Betty Friedan found herself both praised and criticized by an assortment of radical feminists, socialist feminists, eco-feminists, feminists of color, and eventually, third-wave and, as the twentieth century gave way to the twenty-first, even fourth-wave feminists. Conflicts with more conventional views on American history and society provoked by advocates of identity politics of such “new social movements” culminated in “the culture wars” of the 1980s and beyond.

Worth noting also is how Sartre’s *Critique of Dialectical Reason* ([1958] 1976) anticipated many of the political themes of the 1960s while a host of his essays and interviews helped legitimate anti-imperialist resistance movements—and their intellectuals—as well as various dictatorial third-world regimes. In a similar vein, Frankfurt School critical theorist Herbert Marcuse’s *One-Dimensional Man* (1964) pointed to the role of “marginal groups”—intellectuals, women, people of color—as new sources of resistance in advanced industrial society, while *An Essay on Liberation* ([1968] 1969) highlighted the utopian ideals associated with the cultural transformation of everyday life and traditional notions of sexuality.

Overlapping with, but going beyond, issues of race, ethnicity, and gender was the emergence of an interrelated set of postmodernist and poststructuralist tendencies to challenge universals, absolutes, and more specifically, the values and perspectives of Eurocentric, linear, and patriarchal thinking. Postmodernism is an elastic concept that rejects grand narratives and the idea of philosophical foundations. It reflects a world defined by the commodity in which qualitative differences between phenomena have seemingly been obliterated. Whether the most important postmodernists actually contest this “condition” is debatable. But the deconstructive ambitions of its more radical thinkers like Jacques Derrida or Michel Foucault are indisputable. Especially in Foucault’s works like *Madness and Civilization* ([1961] 1965) and *Discipline and Punish* ([1975] 1977), an assault on the power of institutions and linguistic practices becomes evident. It is difficult to speak of a postmodernist or even poststructuralist “school” since the point of this entire enterprise is to highlight the particular. Still, these value-relativizing intellectual trends had important, liberating political implications. Gender, ethnicity, power, violence, and justice were used as analytical tools to question the

epistemology, ontology, and political legitimacy of prevailing modes of thought and structures of power and control.

Conservatism and Neoconservatism

Conservatives were aghast at these developments. Their outlook had always rested on the desire to maintain what has been in the face of what will be. It inherently evinces a commitment to conserve the complex of customs and habits handed down from generation to generation. Conservatism is therefore predicated on both political and cultural assumptions but perhaps less on explicit philosophical principles than what Michael Oakeshott termed in his classic essay “On Being Conservative” (1991) a disposition for pursuing a certain form of conduct. It is a matter of preferring the familiar to the unknown and the lessons of experience to the demands of metaphysics. Change is considered inherently destructive of authority, and if only for this reason, conservatives must logically seek to mitigate it, if possible, and assimilate the new as quickly and painlessly, if necessary. This makes it possible, at least in principle, for conservatives to adapt to any change, to condemn all forms of “prejudice,” and to identify themselves with the interests of minority ethnic groups. As the twentieth century came to an end, however, a new group of “neoconservatives” began their counterattack on the legacy of the 1930s. Journals like *The Public Interest*, formerly edited by Irving Kristol—also known as “the godfather”—and *Commentary*, formerly edited by Norman Podhoretz, framed their general outlook on issues ranging from the need for new censorship laws and the importance of reasserting the capitalist ethos, to the lack of anticommunist vigor on the part of Albert Camus and George Orwell and the importance of combating the “adversary culture” of the 1960s. Neoconservatism was not simply preoccupied with resisting change in the name of some cultural disposition to maintain the status quo. Its advocates were instead proactive in the sense that they sought a radical transformation of American society. Theirs was an attempt to extend anticommunism into antisocialism and then antisocialism into antiliberalism in an attempt to

1. a. give “government” back to the people by attacking “bureaucrats” and “politicians”

2. b. dismantle the welfare state while calling for increased military expenditures
3. c. proclaim the virtues of a new nationalism while combating reforms demanded by “special interests” like women, unions, and minorities
4. d. defend traditional values like “family” and “religion” against the incursions of secular education and the liberal state

Neoconservatives (with conservative support) insisted on a strong executive, security over civil liberties, and the exercise of unilateral actions like the “preemptive strike” in foreign affairs. A particularly influential example of neoconservative thinking is the 1992 Wolfowitz Doctrine (of defense analyst Paul Wolfowitz) that later morphed into the Bush Doctrine used to justify the “preemptive strike” and the “preventive invasion” of Iraq. Neoconservative assumptions about foreign policy are simple: The unassailable superiority of American values makes their extension throughout the world necessary, even if this means ignoring international organizations and insisting on the right to intervene unilaterally whenever and wherever the government believes it must.

The Future of Political Theory

The prospects for new political theorizing in the twenty-first century are both promising and troubling. In recent decades, democracy has emerged as foremost on the agenda of many progressives in Latin America and much of the Third World. The “Arab Spring” is a case in point and so is, in the West, Occupy Wall Street and the great anti-austerity protests in southern Europe of 2012. But its substance, if not necessarily its republican form, remains a subject of debate. New movements are dealing with structural imbalances of political power, deepening class divisions and poverty, religious conflict, prejudice, and the disenfranchisement of minorities. Political theory should not stand on the sidelines. Innovative and cosmopolitan approaches, which recognize and integrate the contributions of non-Western thinkers, are also required to meet the demands of an increasingly global community. Of course, figures like Mahatma Gandhi and Nelson Mandela are lionized. But too little attention has been paid to Aimé Césaire’s *Discourse on Colonialism* (1955), Albert Memmi’s *The Colonizer and the Colonized* (1957), and Frantz Fanon’s *The Wretched of the Earth* (1963).

Environmental challenges, intractable wars, immigration and a global economy, ethnic tensions, and an always looming clash of civilizations all call for a new planetary politics and new ways of thinking about public policy. Political theorists of all stripes will thus need to interpret not merely the canon but also what many still consider radical or exotic approaches in ways appropriate to new political situations and with sensitivity to the way in which an increasingly diverse set of traditions manifest what Ernst Bloch termed an “anticipatory consciousness” linked to the aspirations of the disenfranchised and the exploited.

United Nations, Theories Of The

The United Nations (UN) is an international organization of 193 member states committed to the cooperative maintenance of international peace and security, and to economic, social, cultural, and humanitarian cooperation. The 193 member states seek to achieve these goals through an agreed-to set of restrictions, responsibilities, and mutual obligations as outlined in the 111 Articles of the UN Charter. The history of the UN is not, however, an easy story of achieving these goals. Instead, the UN is a complicated organization of some successes and some failures. UN scholars utilize theory for two primary purposes: to better understand the past and to make credible predictions about the future. A theory provides a specific platform from which to view the past and to look into the future, and for any given topic there can be multiple, and sometimes competing, ideas about which theory affords the most useful viewing platform. The UN defies easy theoretical explanation and is the subject of multiple and often competing theories. As a result, most UN studies shy away from theoretical explanation and are generally empirical and policy oriented; attempts to apply a single explanatory theory to the UN constitutes an eternal (theoretical) reinvention of the wheel. However, an examination of these multiple and often competing theories helps us better understand the limits and potential of the UN to meet its Chartered goals.

Realism and Liberalism at the UN

There are two primary intellectual frameworks in which to consider the UN: realism (concerned primarily with the concepts of power recognition, statehood, and sovereignty) and liberalism (concerned with cooperation and institutional agency).

Realism is generally regarded as the dominant theoretical perspective in international relations and encapsulates assumptions about humanity's propensity for self-interested action above any other consideration, power as the end-all concept in international affairs, and the dominance of the state as a primary and rational actor. Realism can be differentiated into distinct categories including classical realism and structural realism. Classical realists assume that the laws of human behavior are rooted in unchanging human nature and rooted in a person's desire to maximize his or her security. Classical realists such as E. H. Carr argue that the behavior of states reflect this core human condition. However, structural realists, such as Kenneth Waltz, argue that the classical realist concept of human nature is, at best, problematic inasmuch as human behavior is never purely good or purely evil but is instead a complicated mixture of self-interest and altruism. Instead, structural realists look to remove realism from the idea of human nature and relocate it as a purely structural and state-based phenomenon. In terms of realism as a suitable explanatory theory for the UN, it is easy to point to the prevalence of power politics and state-ism at the UN. Indeed, cooperation and institutional agency seems only to exist in the absence of any compromise to member states' sovereign interests. In many ways, the UN points to some obvious realist rhetoric: Classical realists would explain UN behavior as being entirely dependent on the selfish nature of member states who seek only to serve their own interests; structural realists would observe that the existence of cooperation at the UN can be explained from a state-centric perspective in terms of states striving to improve the quality of life and security for their citizens through the avenues offered by cooperation. However, for all the questions that realism is able to answer, there are an equal number left unanswered. If states are interested only in their own relative power and security why are states so often willing to engage in processes and decisions at the UN that are seemingly entirely altruistic and indeed often mitigate their power?

Liberalism is often presented as the primary theoretical competitor to realism. Liberalism is based on what Robert Keohane describes as a faith “in at least the possibility of cumulative progress” (Keohane 1990, 174). Philosophical versions of liberalism can be traced back to Hugo Grotius (1583–1645) and the emergence of the concept of international community. The Enlightenment thinking of philosophers such as Baron de Montesquieu (1689–1755), Jean-Jacques Rousseau (1712–78), and Immanuel Kant (1724–1804) similarly challenged the concept of absolute sovereignty that had been fastened into practice by the Treaty of Westphalia. Rousseau later developed the idea of the social contract, wherein the only way in which humanity can be preserved and can progress is by “uniting their separate powers in a combination strong enough to overcome any resistance, uniting them so that their powers are directed by a single motive and act in concert” (Rousseau 2004, 14). History ultimately disproved classical liberalism as a sole explanation for international relations, but elements of classical liberalism and their idealistic roots continue to inform contemporary liberal thought and remain evident in the UN. Neoliberalism attempts to move beyond classical liberalism to provide a framework for the existence and relative success of international institutions based on the premise that their existence cannot be fully explained by state-centrism and a rational self-interest calculation by member states—instead neoliberals believe that cooperation can emerge through the institutional creation of shared interests and norms. Neoliberals look toward international institutions to improve the quality of cooperation, not to provide a definite and undisputed home for unending cooperation between member states. However, critics have suggested that neoliberalism fails to account for how this supposed emergent cooperation can systematically fail to manage (and sometimes even exacerbate) difficult problems—as is evident at the UN when problems emerge, and often remain unresolved, in politically volatile issue areas.

The differentiation between realist and liberal descriptions of the UN is also evident in how scholars seek to apply specific notions of “instrumental” or “normative” associations to UN studies. Instrumentalist approaches are most often rooted in a state-centric notion of realism that seeks to explain events and circumstances based on a description and evaluation of past events, conditions, and patterns of behavior. The behavior of member states

is understood to be self-serving and self-interested, with the wider cooperative outcomes regarded as secondary to these interests. Normative theory is most often rooted in notions of liberalism and cooperation based on a set of principles or guidelines that contain overt value judgments about how the world should be, rather than how the world actually is. Normative theory prioritizes actions that seek to improve and enhance relations between states within the international system. The efficacy of instrumental versus normative behavior forms the heart of any theoretical discussion of the UN. Is the UN merely a reflection of member states' self-interests played out in an international organization setting, or does the UN engender institutional agency that can override member states' self-interests and shape world events according to a universally applied notion of what is best for the world? The instrumental-normative debate represents a complex and often problematic intersection of values and structures, with the UN representing a venue where the actions of both the individual member states (agents) and the resultant developments that they collectively create (structures) are competitively enacted and interrelated. A fundamental problem with theorizing the UN is that the UN is subject to both normative and instrumental demands. The broadly normative intentions of the organization are articulated clearly in the UN Charter—to save succeeding generations from the scourge of war. However, the real world needs a practical, instrumental map for normative navigation. Realism and liberalism, and instrumentalist and normative theories, all contain the capacity to partially explain and illuminate parts of any individual event or action. But the UN is both part of, and more than, these seemingly dichotomous debates.

Constructivism

According to Adam Roberts and Benedict Kingsbury, scholars of the so-called “English School” “see [the world] as an international society held together by shared norms and values that the UN both reflects and projects” (Roberts and Kingsbury 2000, 62). Constructivists developed English School theory to introduce socially constructed values and norms as variables of international relations. In essence, constructivism posits that international relations are as dependent on social, moral, and historical trends as they are dependent on the perceived inevitabilities of behavior

implied by realism and liberalism. The application of constructivist theory to the UN is to ask how institutions themselves can be the agents of change. Cornelia Navari has identified the UN as both instigator and recipient of normative ideas-based morality—in addition to having a legal, charter-based obligation to act, the UN has developed moral responsibilities. Indeed, there exists a large body of scholarship that would attribute value to the UN on the basis of its being an ideas forum or rules arbitrator (Weaver 1984). Louis Emmerij, Richard Jolly, and Thomas G. Weiss put forward a convincing argument that the UN is uniquely situated to act as an ideas forum. However, in pursuing the idea that the UN exists as a normative ideas-based institution, there is a need for evidence that the institution is capable of meaningful normative behavior beyond the self-interest of member states. Instead, the evidence points toward the UN as only willing to prioritize a normative agenda only when there is no imperative for individual agents within the institution to be bound to a similar normative enterprise. To a large extent, the UN behavior demonstrates that ideas are not enough and that scholars are required to pay due diligence to the more traditional notions of neoliberalism and neorealism that would look for a required convergence of interests and a sufficient power base on which to sustain the desired change.

Functionalism

Theories of the UN must consider the impact of functionalism. Often regarded as a means to try to accomplish a world government, David Mitrany—a major founder of functionalist thought—argued that if states worked together in specific functional tasks or agencies, it would result in larger political cooperation that could ultimately bring about a peaceful international society, that is, that coordination on a specific task would lead to coordination at progressively higher levels of planning and authority until all tasks were governed by the same political authority. However, functionalism ignores the possibility that the conflicts of an anarchical system of sovereign states might merely be transferred to an anarchical system of competing functional agencies. Functionalism, of course, can account for technical cooperation at its highest levels, but it is arguably naïve to assume that functionalism can underlie international politics and international cooperation. The UN can certainly be explained in part by

functionalism—it houses a number of agencies that each seek to solve a particular international problem or task—but there is little evidence of these agencies assuming an authoritative power beyond that of their constituent parts. Each agency remains bound to its members and the sovereign states that they represent. Attempts to identify such agencies as a-political have uniformly failed. Neofunctionalism was born as an attempt to reconcile functionalism and politics. Derived from the experience of European Union integration, neofunctionalism explores the implications and limitations of functionalism and introduces the idea of political spillover, where the effects of surrendering control of technical tasks induce similar behavior on a political level. However, neofunctionalism cannot easily be transported to a global UN level. There have been attempts to suggest that neofunctionalism can offer a limited explanation for the varying degrees of success attached to contemporary UN reform. However, it remains the case that the individual political components of the UN system are too nationally, ethnically, and culturally diverse to be able to replicate the process that was demonstrated at the European regional level.

Conclusion

No single theory has yet been able to account for the entirety of the UN enterprise—instead, scholars must learn what they can from the dominant theories of international organization, each of which play a role in helping us better understand the UN.

Utilitarianism

Utilitarianism

828

833

Utilitarianism

Jeremy Bentham (1748–1832) is commonly acknowledged as the founder of utilitarianism as a systematic theory, employable as a critical tool of analysis and guide to moral action, law, and public decision making. In *A Fragment on Government* (1776), he declared it “a fundamental axiom” that “it is the greatest happiness of the greatest number that is the measure of right and wrong,” and that “the obligation to minister to general happiness, was an obligation paramount to and inclusive of every other” (as quoted in Burns and Hart 1977, 393 and 440–41). In 1781, Bentham coined the name “utilitarian” for this theory. At that time, he had largely completed but not published *An Introduction to the Principles of Morals and Legislation* (1789), in which he delineated the component parts of his “science” of morals and legislation founded on the utility principle, the general purpose of which was “to rear the fabric of felicity by the hands of reason and of law” (as quoted in Burns and Hart 1977, 11).

Although Bentham is usually cited as the originator of the theory, the antecedents of utilitarian principles lie in the philosophy of Plato, Aristotle, and Epicurus, and in early Christian thought. Other significant dimensions of the theory can be traced to the writings of Thomas Hobbes, John Locke, and Richard Cumberland. However, it was the “moral sense” philosopher Francis Hutcheson (1694–1746) who, in his *Inquiry Into the Original of Our Ideas of Beauty and Virtue* (1725), first postulated “*that Action is best, which accomplishes the greatest Happiness for the greatest Numbers; and that, worst, which in like manner, occasions Misery*” (Treatise II, Section 3).

By indicating that quantities of happiness matter in making moral claims, Hutcheson set the agenda for later utilitarian moralists, but he also suggested the limitations of the aggregative approach when he postulated that “the *moral Importance* of Characters, or *Dignity of Persons* may compensate numbers; as may also the *Degree* of Happiness or Misery” (*An Inquiry Concerning the Original of our Ideas of Virtue or Moral Good*, 1725, Treatise II, Section 3).

In the eighteenth century, utilitarian theory was also developed as an accompaniment to Anglican theology. Advocates of the religious variant of utilitarian theory include John Gay (1699–1745), John Brown (1715–66), Abraham Tucker (1705–74), and William Paley (1743–1805). The ethical hedonism developed by these moralists was premised on the existence of a God who would punish and reward individuals in the afterlife according to the degree to which they acted to enhance general happiness in the present life. However, among the religious exponents, only Paley attempted to derive a comprehensive social philosophy from the utility principle, encompassing morals, government, law, and political economy, in his popular *Principles of Morals and Political Philosophy* (1785).

Bentham’s secular version of the theory was derived from a more progressive strain of Enlightenment thought: empirical, analytical, and antagonistic toward religion. David Hume (1711–76) and Claude Adrien Helvétius (1715–71) were especially important in this regard. In *A Treatise of Human Nature* (1739–40), Hume located the source of the rules of justice in general utility, but he explained the psychology of moral conduct in terms of a theory of “moral sentiments” rather than of motives supplied by pleasures and pains. In *De l’esprit* (1758), Helvétius provided a systematic if rudimentary explanation of human motivation in terms of utility perceptions and expectations and some useful suggestions for the application of this knowledge to law and other social questions. Unaware of Hutcheson’s formulation of the utility principle, Bentham attributed it to the Italian law reformer Cesare Beccaria (1738–94) and sometimes to the Nonconformist and natural philosopher Joseph Priestley (1733–1804). In Beccaria’s *Dei delitti e delle pene* (1764), Bentham found a clear statement of the utilitarian formula and its application to an examination of criminal law. The actual phrase “the greatest happiness of the greatest number” is not

found in Priestley's *Essay on the First Principles of Government* (1768). What Bentham would have read there was Priestley's general statement of the need to base policy and law on the principle of utility, which is understood as the general happiness of the community.

The classical form of utilitarian theory encompasses two essential principles: (1) The rightness or wrongness of an action is determined by the goodness or badness of its consequences; and (2) the only thing that is good in itself is pleasure and the only thing bad in itself is pain, and happiness is the net aggregate of pleasures over pains. Based on these elements, the doctrine is then expressed in the form of the greatest happiness principle: The rightness of an action is determined by its contribution to the happiness of everyone affected by it. For Bentham, the relationship between happiness and pleasure and pain was straightforward and did not require elaboration: Pleasure contributes to happiness, while pain detracts from it. In these terms, the public interest is constituted of the aggregate of individual interests, construed in terms of the balance of pleasures and pains experienced by each person. This balance is "the sole end which the legislator ought to have in view: the sole standard in conformity to which each individual ought, as far as depends upon the legislator, to be *made* to fashion his behaviour" (as quoted in Burns and Hart 1977, 34). The legislator has four "sanctions" or sources of pain and pleasure at his disposal, by which to influence individual actions and gain conformity to his decisions: physical, political, moral, and religious. The use of these sanctions explains how an essentially self-interested individual can be encouraged and, where necessary, directed to perform actions that enhance the general happiness of both the individual and others. Bentham may have found these sanctions in John Gay, but contrary to Gay, he did not place the "religious" sanction at the head of the list in terms of efficacy. The physical sanction is fundamental to all motivation, while the political and moral sanctions are the primary instruments of utility, acting principally through the laws and the informal mechanisms of public opinion.

Given the function of the four sanctions delineated by Bentham, it is incumbent on the legislator to understand the "value" of the pleasures and pains he employs as the "instruments" to achieve the end in view. Bentham's felicific calculus describes the elements or dimensions of the

value of a pleasure or pain. To an individual, the value of a pleasure or pain will be more or less according to its “intensity,” “duration,” “certainty or uncertainty,” and its “propinquity or remoteness.” Where the object is to measure the value of a pleasure or pain in terms of the tendency of an act, there are two additional circumstances to be taken into account: “fecundity,” that is, “the chance it has of being followed by sensations of the *same* kind,” and “purity,” that is, “the chance it has of *not* being followed by sensations of the *opposite* kind.” Where there are a number of persons with reference to whom the value of a pleasure or a pain is considered, a further circumstance must be factored into the calculus—the “extent” or the number of persons affected by the pleasure or pain (as quoted in Burns and Hart 1977, 38–39). In sum, these are the dimensions of the value of pleasures and pains that must be considered by the legislator to arrive at the correct law or policy.

One of the most serious challenges to Bentham’s approach to the value of pleasures and pains is found in the later version of utilitarian theory expounded by John Stuart Mill (1806–73), first stated in the essay “Bentham” (1838) and given definitive expression in *Utilitarianism* (1861). The most problematic of the refinements of the theory Mill offered was the distinction between the *qualitative* differences of types of pleasures, an idea found in rudimentary form in Paley’s *Principles* (Bk. I, Ch. VI). Although adhering to the basic hedonism of utilitarian theory and to the Benthamic analysis of motives, Mill argued that certain “higher pleasures,” by which he meant the pleasures of altruism and the cultivation of the higher feelings and the intellect, were intrinsically more desirable or worthy than other pleasures. However, this qualitative distinction seemed to undermine the aggregative dimension of the theory and introduced a questionable elitism in terms of who was the appropriate judge of which pleasures were preferable. Recent scholarship has questioned whether Mill’s distinction was really a departure from Bentham’s theory. It is arguable that Bentham’s discussion of pleasures and pains implicitly recognized that certain sorts of pleasures were preferable to others, and that his strictures on measurement referred to quantitative measures of pleasures that are the same in quality (Rosen 2003, 174–80). However, Mill raised further questions about the integrity of the theory by arguing that the constituent elements of an individual’s happiness might encompass objectives such as the pursuit of

truth, beauty, and virtue, without consideration for the utility they may bring. This view was later adopted by G. E. Moore (1873–1958) in the *Principia Ethica* (1903). Rejecting the hedonism of Bentham and Mill, Moore set forth a “consequentialist” theory now known as *i deal* utilitarianism, in which the “good” to be attained is more expansive than the summation of pleasures, and contains within itself certain objective features of the universe, preeminently, the beauty of its constituent parts.

A common complaint about utilitarianism, at least in its classical form, is that there is an unresolved conflict between the goal of the greatest happiness and the psychological hedonism according to which the motivation for action is explained. Simply put, how can essentially self-interested individuals be expected to pursue the good, that is, the happiness of others? Elie Halévy addressed this issue in *The Growth of Philosophic Radicalism* (1901–4), explaining that we can detect two distinct but compatible approaches to the question in the writings of the classical utilitarians: a “natural harmony” of interests and an “artificial identification” of interests. A “natural harmony” of interests is typically produced in the realm of economic activity when individuals pursuing only their own interests ultimately produce outcomes beneficial to the public interest. This idea has its roots in Bernard Mandeville’s *Fable of the Bees* (1714) and is elaborated in the writings of Adam Smith and others in terms of the operations of an “invisible hand” or the “unintended consequences” of individual actions. Some utilitarians, such as the American Richard Hildreth (1807–65) in *Theory of Morals* (1844), reversed the relationship when they counseled that only by pursuing benevolence will individuals find their own personal happiness—an echo of Plato’s argument in *The Republic*. An “artificial identification” of interests is usually the product of law and its sanctions, which are intended to introduce additional motives into an individual’s consideration of particular actions and dissuade him from conduct contrary to the public interest. Education, particularly moral instruction, was sometimes seen as a way of bridging these two approaches; once individuals properly understand their duty to act in the public interest, then the sanctions of law become redundant. The optimism implicit in this idea led William Godwin (1756–1836) in *An Enquiry Concerning Political Justice* (1793) to envisage a time when societies might be able to function

entirely on the principle of cooperation without the need for law to produce the greatest happiness.

The distinction between “act” and “rule utilitarianism” has frequently exercised scholars. Although sometimes described as an act utilitarian, for Bentham, properly constituted rules, based on calculations of general utility, should be the guides for human conduct. Simply put, it is not realistic to expect an individual to calculate the anticipated consequences of actions in every instance. The function of utilitarian rules of morality and justice is to save the individual from this onerous burden. However, where new evidence suggests that the rules are ineffective, are improperly constructed, or produce outcomes inconsistent with general utility, then the agent must engage in a first-order calculation. However, in the ordinary run of things, we must rely on rules of conduct to guide us. John Austin (1790–1859), a disciple of Bentham’s jurisprudence, is usually cited as the first explicit rule utilitarian. However, in *The Province of Jurisprudence Determined* (1832), he made it clear that he had learned the significance of rules from Paley, from whom he also borrowed the theological elements of his theory. Hume and Tucker were also clear about the centrality of rules. To the criticism that utilitarianism sacrificed principles to expediency, Mill replied that it was expedient to observe the rules associated with general utility and implied that only saints could be utilitarians, able to continually calculate the consequences of their actions. The debate between “act” and “rule” utilitarianism features in the exchange between the modern act utilitarian J. J. C. Smart and his critic Bernard Williams in *Utilitarianism: For and Against* (1973).

The prevailing preference for rule utilitarianism has not prevented critics of the theory from stressing the implications of an aggregate-utilitarian calculation for societies in which unpalatable sacrifices seem to be determined by calculations of optimal utility. In *A Theory of Justice* (1971), John Rawls argued that in counting *only* interests and aggregating *across* persons to arrive at the appropriate action or policy, the utilitarian fails to “take seriously” the distinction between persons. Derek Parfit launched a similar attack in *Reasons and Persons* (1984) when he demonstrated the absurdity of aggregate happiness comparisons between hypothetical future societies in a regressive examination of situations in which increases in

population were matched by decreases in happiness. The logic of Parfit's comparative analysis culminates in the utilitarian's choosing a situation in which hundreds of billions of people experience lives that are hardly worth living over a future in which a far smaller number of people are extremely happy. Paul Kelly offered a vigorous response to these sorts of criticisms in *Utilitarianism and Distributive Justice* (1990). Kelly argued that at the level of private ethics, utilitarian calculations implicitly acknowledge that different and distinct persons are involved in most situations about which individuals have to make moral judgments. And, more especially, a consistent utilitarian will treat the interests of different people affected by his or her actions as of equal importance. In Mill's theory, this position took the form of the "impartiality" requirement, which states that the agent should not give a preference to her own interest over that of others affected by her actions but should treat all interests, her own and those of others, equally. This impartiality suggests that utilitarian theory should not be construed as *merely* aggregative. Moreover, versions of the theory that stress it as a foundation for law, particularly in relation to "indirect" utilitarian approaches to achieving the greatest happiness, offer the most fruitful line of defense. From this perspective, utilitarians argue that legally sanctioned minimum guarantees in the form of basic rights make issues of distribution rather less sensational than critics—who stress the plight of minorities and the vulnerable at the mercy of strict aggregate calculations—commonly suppose.

Utilitarianism has enjoyed a sustained, if at times ambiguous, presence in the liberal tradition, and it continues to have a major presence in economic theory, generally subsumed under the concern with material welfare. Classical economists from Adam Smith and John Mill to Alfred Marshall (1842–1924) and Arthur Pigou (1877–1959) were especially concerned with the situation of "productive labour," the needs of those members of society who, as Mill explained in *Principles of Political Economy* (1848), produced the "utilities fixed and embodied in outward objects," that is, the production of the utilities or pleasures created by "investing external material things with properties which render these serviceable to human beings" (as quoted in Warnock 1962, 45–46). Mill is commonly understood as a *liberal* utilitarian who advocated an "indirect" version of utilitarianism in a more clear-cut way than is evident in Bentham's writings. Since law

involves sanctions and restricts individual liberty, there are always *prima facie* moral reasons against enacting law. Mill developed this concern into the famous “harm” principle in *On Liberty* (1859), according to which the sovereign should interfere with the actions of individuals only when these could be shown to be harmful, or potentially harmful, *to others—and not even in all such cases*. The application of this critical principle of morality was further developed in the positivist legal theory of H. L. A. Hart, particularly in his debate with Lord Devlin in the 1960s concerning the decriminalization of homosexuality between consenting adults. Mill’s theory of justice stressed the utility value of *security*, and his moral philosophy placed the accent on individuals being facilitated by government in the pursuit of happiness in ways of their own choosing, rather than being directed into particular codes of conduct. Both elements required that definable limits be placed on the functions of law and determined a gradualist approach to achieving optimal utilitarian outcomes through social and political reform. However, Mill also stressed the egalitarian character of utilitarianism when he claimed that the maxim “each to count for one, and none for more than one” (attributed to Bentham) should be “written under the principle of utility as an explanatory commentary” indicating that each person possessed an equal right to happiness (as quoted in Warnock 1962, 319). Added to which, in later life he was inclined toward collectivist solutions to social problems, most notably, in the *Chapters on Socialism*. In *Social Statics* (1851), Herbert Spencer (1820–1903), like Bentham and Mill, argued that everyone possessed an equal capacity for pleasure and everyone should, therefore, be counted in calculating social welfare. However, in *Man versus the State* (1884), he employed the utility principle to enhance the liberty of the individual, defend the existing social order, and attack the drift toward socialism and “slavery.” Other reform-minded liberals, like Leonard Trelawny Hobhouse (1864–1929) in *Liberalism* (1911), found in the protean nature of utilitarianism a justification for distinctly nonindividualist policies. Hobhouse incorporated utilitarianism into a new liberal discourse that, in addition to laissez-faire economics, also bridged elements of socialism, Social Darwinism, and the idealism of Thomas Hill Green (1836–82), and out of which emerged the beginnings of Britain’s welfare state.

Henry Sidgwick (1838–1900) also gave voice to “socialist” sentiments in developing his *intuitional* utilitarian theory in *The Methods of Ethics* (1874) and other writings. Often described as the most philosophically sophisticated of the classical utilitarians, Sidgwick was not a utilitarian in an unqualified sense of the term, and on the question of religion, he sided with Paley and Austin rather than with Bentham and Mill. He believed that only some form of theological postulate about the moral harmony of the universe could plausibly resolve the potential conflict between the moral point of view and the personal point of view. He thought the utilitarian perspective was the correct point of view for those in political power and administrative positions in the state—their enlarged responsibilities required it since they are most likely to be able to put such a view into practice—but it is simply not expected of private individuals. This distinction led Sidgwick to develop an ethical theory based on an amalgamation of utilitarian principles with intuitionism. The criterion for utilitarianism is the general happiness; the criterion for intuitionism is the conformity to duty as defined by fundamental and self-evident principles. By comparison, egoism, included by Sidgwick as one of the “methods” of ethics, offers an account of motives in terms of the happiness of the individual alone.

Among the early classical political economists, David Ricardo (1772–1823) is best known for working with the utilitarian standard of happiness as the criterion against which all policy should be assessed, in *The Principles of Political Economy and Taxation* (1817). In *The Theory of Political Economy* (1871), William Stanley Jevons (1835–82) explicitly took his starting point from Bentham’s utility theory, along with the axiomatic proposition that each person acts to maximize his or her own pleasure, and developed a sophisticated examination of consumer behavior in the marketplace. The mathematician and economist F. Y. Edgeworth (1845–1926) integrated the idea of biological progress in his thoughts on social welfare, leading him to question the utilitarian assumption of moral equality (*Mathematical Psychics*, 1881). Just as societies differ in their levels of civilization, so groups or classes of individuals within a society stand at different levels of evolution, with those at the higher levels demonstrably more capable of education and improvement. Concomitantly, this distinction reveals differences in capacities for happiness, and leads to the

conclusion that the objective of social welfare may require that policy makers sacrifice the happiness of the lower classes to the happiness of the higher classes. Contrary to this view, and under the powerful influence of Pigou's utilitarian analysis in *The Economics of Welfare* (1920), Lionel Robbins (1898–1984), who thought of himself as a “provisional” utilitarian, argued that “as a first approximation” in dealing with major policy questions, “the approach which counts each man as one, and, on that assumption, asks which way lies the greatest happiness, is less likely to lead one astray than any of the absolute systems.” This logic was not because Robbins subscribed to the natural-law assumption that all individuals are in fact equal but that “in most cases, political calculations which did not treat them *as if* they were equal are morally revolting” (1938, 635). However, Robbins could not entirely free himself from the thought that Edgeworth may have been right in supposing that some are more capable of happiness than others, a conception that would necessarily undermine attempts to construct cost–benefit calculations based on the assumption of equality. This dilemma led Robbins and other economists to conceive utility calculations in “ordinal” rather than in “cardinal” terms.

The transition from cardinal to ordinal utility calculations in the 1930s and 1940s constituted a revolution in economic value theory. Interpersonal comparison, and with it the tendency to conceive utility or welfare as cardinal and aggregative across individuals, were now generally shunned in favor of ordinal-value theory based on the ranking of states of affairs. This way of looking at the world originated with the *Manuale di economia politica* (1927) by Vilfredo Pareto (1848–1923). In principle, aggregative utility calculations allow us to rank and compare all states of affairs, but where interpersonal comparisons or aggregative calculations are ruled out, then it is much more difficult to make such rankings. Two competing policy options may both produce a positive outcome but for different sections of the population, and this fact makes it ambiguous whether one policy should be preferred over another or whether the status quo is preferable. For this reason, economists have generally adopted the idea of ordinal utility and have employed it as a mathematical tool for ordering noncomparable preferences. Nevertheless, the uncertainties that attend ordinal utility calculations have spawned an extensive literature in game theory, in which

strategic choices are only ever contingently correct or right (productive of an overall good) depending on the choices of others.

Writing in the early twenty-first century, Richard Layard is one of few mainstream economists to turn his back on ordinalism to argue that governments should base economic policy not on its potential for contributing to the country's gross national product but rather on the original Benthamic guide of the maximization of happiness, construed in terms of the average happiness of the population and adjusted to give extra weight to the happiness of the least well-off. In making this case in *Happiness: Lessons from a New Science* (2005), Layard substantially reiterated and defended the positions of the classical utilitarians, most notably, Bentham and Mill.

Utopianism

I have never understood why the charge of utopianism is necessarily thought to be an objection to a theory of politics. One legitimate aspiration of moral and political theory is surely to show us what lines of action we are committed to undertaking by the values we profess to accept.

—Skinner 1998, 78–79

The word *utopia* was coined by Thomas More (1478–1535) as the name of the imaginary country in his 1516 book *Libellus vere aureus nec minus salutaris quam festivus de optimo reip. statu, deq. noua Insula Vtopia* (“Concerning the Best State of a Commonwealth and the New Island of Utopia”), now known as his *Utopia*. The word, Latin but derived from Greek, simply means “no place” or “nowhere” (*u* or *ou* means “no” or “not”; *topos* means “place”), but More played with an alternative prefix *eu*, or “good,” and the word *utopia* has come to mean a “nonexistent good place.” Although More gave a name to the practice of depicting imaginary places, such depictions have been found in all cultures at least as early as the written word and probably earlier.

After More, the word “utopia” seemed almost to take on a life of its own. The Polish philosopher Leszek Kolakowski (1927–2009) noted the process by which a word that

emerged as an artificially concocted proper name has acquired, in the last two centuries, a sense so extended that it refers not only to a literary genre but to a way of thinking, to a mentality, to a philosophical attitude, and is being employed in depicting cultural phenomena going back into antiquity. (Kolakowski 1990, 131)

Today, utopianism is the label for all these phenomena. Specifically, utopianism includes four overlapping but different things (Sargent 1994). First, it is, as Kolakowski notes, a genre of literature, one that in a wide variety of forms has existed from far back in antiquity. Second, many attempts to bring an imagined ideal into practice have been called utopian. These also can be traced as far back into antiquity as Hindu ashrams as early as 1500 BCE, and later Buddhist monasteries, the Jewish community at Qumran, and the early Christian church in Jerusalem, among other early examples. Third, it became, much later but with early roots, what Kolakowski called “a way of thinking,” “a mentality,” “a philosophical attitude,” and can be more generally called utopian social theory. Fourth, there is anti-utopianism, which can be seen as early as Aristophanes (448–380 BCE), a category that includes Kolakowski. And over time all four and the ways they overlap have become more complex.

Utopian Literature

Some texts of utopian literature, like More’s *Utopia*, much of utopian social theory, and anti-utopianism are commonly included within the history of political thought, but much of the literature and most of the practice are not, even when they belong there. Utopian literature and practice reflect the issues of their time and are more inclusive than much political thought because they are not narrowly political but include the political within a broader social context that includes such things as child-rearing and education, religion, economics, and gender relations, among others. This showing of an embedded political either through imagination (literature) or experiment (practice) is one reason utopianism is central, or should be, to the history of political thought.

Utopian literature has always played two roles, critique and proposal, with the first more important than the second. In almost all utopias, a comparison is made between the existing society and the utopia, obviously to the detriment of the existing society. And utopias have always had a strong satirical vein, some of it acting as a critique of the present, and some, in more complex texts, also reflecting on the utopia being depicted.

The earliest post-More utopias in the Western tradition stressed the importance of a strictly defined Christian life, but the genre of literature quickly took advantage of More's multifaceted text and developed in a variety of directions, with utopia as critique particularly important. Other works reached back before More to the Arcadia and the Golden Age and Earthly Paradise, but as early as the beginning of the seventeenth century, utopias presenting specific economic, political, and social proposals were published. Utopianism has, therefore, been marked by considerable variety throughout its history.

Initially, the political role of utopianism was straightforward in that it was a way of making an argument about social improvement that might, because of its fictional form, escape the attention of censors and, for the same reason, attract a wider audience. And to escape the censors, many utopias were published anonymously or under a pseudonym and with false places of publication and publishers. That their authors did not always escape is neatly exemplified by the title page of the 1795 *The Commonwealth of Reason*, which gives the author's name as "William Hodgson, Now confined in the prison of Newgate, London, for sedition."

Utopian literature became particularly important politically at the end of the nineteenth century with the publication of *Looking Backward: 2000–1887* by Edward Bellamy (1850–98). This novel directly inspired new political programs to nationalize industries or municipalize utilities throughout the world. Bellamy's utopia was, like most in the nineteenth century, socialist. Utopian literature has always reflected the dominant (and many minor) questions in any period. As noted, economic issues dominated the late nineteenth century, and socialist or antisocialist utopias were very common. But at the same time, a slightly less common concern with eugenics came to the fore, and many utopias written at the time included some examination of

eugenics, even if it was not central. That concern has regularly recurred in the literature since then, and today, with the advent of the possibility of genetic engineering, it often takes center stage, mostly in dystopias. The middle of the twentieth century was concerned with communism and national socialism or fascism, and many anti-utopias were written directed against them. At the beginning of the second half of the century, utopias focused most strongly on feminism and environmentalism, and in both cases, utopias came to play prominent roles in the feminist and environmental movements.

In the early myths, utopia was brought into being by nature or the gods, but in utopias brought about by human action, some further explanation is needed. Therefore, although often without great detail, utopias generally include some notion of how the utopia is to be achieved. In most cases, it is brought about by evolution rather than revolution. And the primary means of achieving utopia are relatively limited. First, and central to utopianism throughout its history, is religion. In particular, for Christians, utopia can be achieved if people actually follow the church's teachings rather than just paying lip service to them. Second in importance is education, which is important for both achieving and maintaining utopia. Third in importance is law. Changing the laws can help to bring utopia about, and having the right laws in place will be essential to keeping the utopia once it has been established. But, and this is where utopias vary tremendously, the content of the education and the laws is of central importance. Here there simply is no generalization possible. Utopias and dystopias have been written from every imaginable perspective. It is true that there have been dominant images at different times and places, but these were always accompanied by other utopias projected on different bases that reflected the concerns of different groups in society or even just the interests of a particular individual.

As noted, from Aristophanes on, there has been an anti-utopian literature that attacks either specific utopias or utopianism in general. Connected with the upsurge of utopias written after the publication of Edward Bellamy's *Looking Backward: 2000–1887* (1888), an upsurge of works purported to show what Bellamy's future would really be like and why it would be bad rather than good.

Although the word *dystopia*, or “bad place,” was used as early as the middle of the eighteenth century, it became prominent as a literature and concept only in the early twentieth century. Yet it has become the dominant form of utopian literature since then. Even though many dystopias depict a simplistic authoritarianism, the genre is much more complex and less negative than that stereotype in that dystopias act as jeremiads depicting what will happen if the human race does not shape up. This perspective at least implies that humanity can still mend its ways and avoid the depicted future. Thus, many dystopias serve explicitly as warnings against continuing current behavior.

Utopian Practice

In parallel with relevant literature during the Reformation, radical Protestants established communities in which they hoped to lead the lives their reading of the Bible required of them. Few found it possible to do so in Europe and therefore chose to move to the Americas, with the first such community established by Dutch Mennonites in 1659 and others following, particularly from Germany and then from England.

The early communities were religious; some were simply trying to lead the life they thought the Bible required, while others were preparing for the Second Coming of Christ, which they believed to be imminent. But in the early nineteenth century, secular communities became common, often with the idea of showing what could be achieved by following the teachings of some theorist, with quite a few communities established to create the world outlined by the so-called utopian socialists, most often Robert Owen (1771–1858), Charles Fourier (1772–1837), and Henri Saint-Simon (1760–1825), and sometimes including Étienne Cabet (1788–1856). But “utopian socialism” was given its name and was sympathetically criticized but ultimately rejected by Friedrich Engels (1820–95) and Karl Marx (1818–83) and their followers. Marxists faulted the utopian socialists for engaging in wishful fantasies not rooted in actual historical processes—unlike the “scientific socialism” they advocated. None of the secular communities founded in the nineteenth century lasted very long, with fire, a scourge of many nonutopian villages, being a common cause of failure, together with internal disputes, lack of money or skilled labor, and poor or uneven

leadership. Religious communities such as the Shakers and Hutterites lasted longer, with some founded as early as the seventeenth or eighteenth centuries still in existence. The largest network of communities today, now a century old, is the Israeli kibbutzim. And some religious communities have advocated as strongly for nonreligious change as their secular counterparts, with economic and gender equality, direct involvement in decision making, and nonviolence being issues of particular importance.

Such communities, both religious and secular, were often called utopian experiments because the people were experimenting with their own lives, with some schemes being radical. The most common feature of such communities was some version of common property, but many engaged in different sexual relations, ranging from celibacy to forms of collective marriage. Most secular communities and some religious ones aimed at, and some achieved, greater political, economic, and gender equality. Some worked to change how people prepared and ate their food (common kitchens and meals), and some changed what people ate (vegetarian and fruitarian communities). Many tried to mix mental and physical labor, valuing both equally, and many tried to vary work so that no one was required to do the same thing all the time.

Although awareness of such communities varied over time, they continued to be established on a regular basis, flourishing, or languishing for a time, and either continuing to the present or closing; indeed, this pattern continues to the present. The one great break in the pattern occurred in the so-called 1960s (dates vary from country to country) when thousands of mostly secular communities were established, many deliberately temporary and for specific purposes like antiwar activism or producing an underground newspaper, but many had a broader vision. A substantial number of the communities founded in the 1960s still exist, although rarely with the same people. Since then, the community movement has gone in a number of new directions such as environmentally focused ecovillages, communities for seniors, single-sex communities, and cohousing, which combines individual homes with substantial community space. Thus, people are still experimenting with their lives to find a better way of life.

Throughout the history of communal living, opposition has been strong. Some ex-members have concluded that they were misled and mistreated or simply feel that the communities did not meet their expectations. For example, in his novel *The Blithedale Romance* (1852), Nathaniel Hawthorne (1804–64) reflects on his not very happy experience at the Brook Farm Community. Others attacked communities from the perspective of a different vision of how life should be lived, seeing such experiments as a danger to their preferred vision. These contending visions illustrate why utopian practice is appropriately part of the history of political thought, and the texts created by the communities, describing and defending their visions, are certainly contributions to that history.

Utopianism and Social Theory

Although there have been utopian and anti-utopian texts throughout history, it was utopian practice that elicited, in the first half of the nineteenth century, the first systematic anti-utopianism, directed initially at Robert Owen by those supporting the existing economic system and then slightly later against the utopian socialists by Marxists. Since then, Marxists have been divided on the question of utopianism, with many continuing the rejection by Marx and Engels, but with others, like Ernst Bloch, arguing for the central importance of utopianism.

The most sustained attack on utopianism came in the mid-twentieth century from those who equated it with communism and National Socialism. The best-known such attack is Karl R. Popper's (1902–94) *The Open Society and Its Enemies* (1945), whose argument is fairly simple and straightforward. In its most basic form, utopia is said to equal perfection, and since human beings are not perfect, the supporters of the utopia will require force and violence to achieve their ends and in doing so will favor an authoritarian regime. A variant of this argument describes utopias as blueprints of an ideal society that are intended to be constructed in all their detail, which will then similarly require force, violence, and an authoritarian regime. But as George Kateb wrote, "any serious utopian thinker will be made uncomfortable by the very idea of blueprint, of detailed recommendations concerning all facets of life" (as quoted in Manuel 1967, 239).

The argument in favor of utopianism is put as forcefully as that against. If the Popperian position implies the end of civilized life, the position put forth by Karl Mannheim (1893–1947), F. L. Polak (1907–85), Ernst Bloch (1885–1997), and others is that civilization depends on our continuing ability to imagine utopias or, in Polak’s words, “positive images of the future.” Put generally, the argument is that since few if any believe that we now live in the best of all possible worlds, it is essential that we take seriously the need to imagine what a better world might look like. Doing so will allow us to set priorities and create the tools needed to move in the right direction. In his major work, *The Image of the Future* (Dutch 1955/English 1961), Polak traces the history of such images in Western thought.

Ernst Bloch is generally considered the most important modern theorist of utopianism, which is central to his understanding of the world. Bloch sees elements or fragments of utopia everywhere, many such elements compensatory or “abstract” but some expressing the possibility of the “concrete.” And like Polak, Bloch, in his major work, *The Principle of Hope* (German 1955–9/English 1986), develops a history of utopianism.

Much of the twentieth-century debate over utopia has also been seen from the point of view of conflicting ideologies, and the relationship between ideology and utopia has been an important issue starting with Karl Mannheim’s *Ideologie und Utopie* in 1929 and his quite different *Ideology and Utopia: An Introduction to the Sociology of Knowledge* in 1936. Although Mannheim made clear distinctions between the two, as did Paul Ricoeur (1913–2005), the other major theorist of the two concepts, many commentators conflate the two. For Mannheim, ideology reflects the mentality of those in power, and utopia reflects the mentality of rising groups. For Ricoeur, ideology provides legitimation for a group, and utopia challenges that legitimacy. For both, utopia is more important than ideology in that Mannheim contends that if we lose utopia, we lose our humanity, and Ricoeur argues that although both ideology and utopia have positive functions, we need utopia as a constant challenge to ideology.

Thus, utopianism has played an important role throughout the history of political thought. And although the focus here has been on Western political

thought, utopianism has also been important outside that tradition, particularly, but not exclusively, in Chinese and Indian political thought.

Voegelin, Eric

One of the most creative and prolific political philosophers of recent times, Eric Voegelin (1901–85) was born in Cologne on January 3 and grew up in Vienna. He joined the Faculty of Law at the University of Vienna, beginning as an assistant to Hans Kelsen. Following the *Anschluss* of 1938, when Germany occupied and annexed Austria, Voegelin was dismissed because of his books and other work in opposition to Hitler and the National Socialists. Shortly thereafter, he narrowly escaped the Gestapo by fleeing to Switzerland and then the United States, where he resumed his academic career. Along with his wife, Lissy Onken, Voegelin was naturalized as a U.S. citizen in 1944.

Academic Career

In the United States, Voegelin taught at Harvard University, Bennington College, Northwestern University, and the University of Alabama; then, in 1942, he joined the faculty at Louisiana State University, where he remained for sixteen years. He became one of the university's first three Boyd Professors and also taught jurisprudence in the law school. In 1958, Voegelin accepted an appointment as chair in political science at the University of Munich, a position that had been last held by Max Weber. There he established the Geschwister Scholl Institute for Political Science in the hope, he said, of fostering democratic free government in Germany.

In 1968 he retired from this position to become the Henry Salvatori Distinguished Scholar at the Hoover Institution at Stanford University.

His principal writings are gathered in the *Collected Works of Eric Voegelin* (hereinafter cited as CW), which among other things includes the eight volumes of *History of Political Ideas* and the five volumes of *Order and History*. The Eric Voegelin archive of over 76,000 documents is lodged in the Hoover Institution, indexed, and available on microfilm.

Political Philosophy

The hallmark of Voegelin's political philosophy is the quest for political reality and its truth and resistance to reductionist ideologies and deformations, in both theoretical and practical aspects. In pursuing this path, Voegelin elaborates a new science of politics that critically abandons the positivist mode of inquiry in favor of a philosophical science grounded in classical noesis as the new paradigm of inquiry, one empirically anchored in noetic and pneumatic (revelatory) experiences of reality. Philosophizing as the love of wisdom rather than its definitive possession is essentially exploration of the tension toward transcendent divine Being as experienced in noetic and pneumatic modes by individual contemplatives. This opening of the horizon of inquiry reaffirms the salience of commonsense experience in thought and practice and stresses the pertinence of the whole hierarchy of being from Anaximandrian *apeiron* (Depth) to divine *Nous* (Reason) for the realm of human participation and striving. As a result, human nature is understood to be the epitome of being, and every human being participates in all levels of reality from the material to the divine. As a further consequence, a satisfactory political order must take account of this range of reality in its representation of true order in society. To fail to do so or to invert lower dimensions of reality for higher ones leads to deformation of existence through reductionism. For example, such reductionism may elevate materiality as the highest being—over spiritual and intellectual spheres, as in Marxism; by the racial biologism of the National Socialists; or by the Nietzschean egophanic apocalypse of the *Übermensch*, whereby the highest being for man is man himself. This line of analysis obviously involves ontology and epistemology and does so by restoring the full sphere of human reality, on one hand, and by evoking a more inclusive range of

experience so as to include participation in being, on the other. All of this is generally familiar from classical and medieval philosophy, and all of it is occluded or rejected in the reigning scientific mode of analysis and paradigm of the sciences of human affairs as merely phenomenal and concerned with knowledge of things.

In addition to the problems of reductionism, the ideological deformation can occur from a number of other sources, including immanentization of faith symbols as famously sketched in Voegelin's *New Science of Politics* (1952), his first book in English. Here the several aspects of the Christian eschatological faith symbols are treated (immanentized) as though they were intended to apply to temporal political processes rather than to illuminate the tension toward transcendent divine being. Thus, the pilgrim's progress or journey through time in partnership with God yields progressivism, the ultimate state of fulfilment in Beatitude; union with God becomes utopianism; and the immanentization of the entire symbolism yields the revolutionary activism of the Marxian dialectic. In this process of modern "gnosticism," the supplanting of faith by the certitude of knowledge involves moving from uncertain truth to certain untruth. The account is elaborated to include four symbolisms drawn especially from the writings of Joachim of Fiore (born c. 1130–35, died 1202) as typical of the immanentist deformation—the division of history into three ages of increasing degrees of perfection: the intellectual who knows the truth of reality basic to the gnostic dogma; the leader of the new age of truth that will lead humankind to fulfillment; and the culminating third age of history conceived as the brotherhood of autonomous persons (perfected through a free descent of Grace in Joachim) when no governing institutions will be needed and the "perfecti" can live together without coercion. (For Voegelin this narrative was adapted in the secularized narratives of Auguste Comte, Karl Marx, and the National Socialist *Dritte Reich*.) All are characterized by a prohibition against questions that could invalidate the dreamworld second reality's dogmatic truth claims and restore order—as in Marx's injunction *denke nicht frage mich nicht*, since a rational man sticks to the reality under his eyes and doesn't ask questions about the Ground of being (Marx, "1844 Manuscripts").

The matrix of this critique that pronounces gnosticism to be the essence of modernity (later qualified in Voegelin's work to include also a range of additional factors such as alchemy, magic, and apocalypticism) is the constructive philosophy of consciousness and history fundamental to Voegelin's ontology. Here it must be stressed that the reality question is basic to political theory in his view. The core of that comes with the insistence from his earliest writings that an essential part of inquiry is the meditative exploration of the heights and depths experienced and symbolized as an impetus begun in the open inquiry in classical philosophical noesis as it eventually culminates in the Anselmian *fides quaerens intellectum* of faith in search of understanding. The stages of emergence of divine-human disclosure of highest truth are represented in the cosmological foundation reflected in myth; the breakthrough (leap in being) to the transcendent truth in the anthropological truth of the classical philosophers (vision of the *Agathon* or Good beyond being in Plato; the contemplative's rise to *athanatizien* or immortalizing in Aristotle; the substance of society as *psyche* so that society is Man writ large); and the further differentiation through revelation of soteriological truth as elaborated in the First Epistle of John 4 as *amicitia*. There follows Aquinas's great philosophy of man developed from it in terms of *fides caritate formata* or faith formed through love as the climax of the meditative movement of the human response to divine disclosure and truth of the participatory divine-human partnership in being that is paradigmatic and underlies the Anselmian quest ontologically.

Voegelin's path to this vision of metaxic reality (the In-Between of human existence in all times and places), the quest of a lifetime, can only be hinted at here. But the orientation toward it filled his mind and shaped his work from early on, as can be gleaned from further examples arising in his writings and reflecting his conviction of mystical philosophy as the authentic posture of open existence in all the great philosophical meditations in the Western tradition from Parmenides onward (CW15, 279–93; CW18, 102–04).

Already in his 1928 book *On the Form of the American Mind*, the 27-year old Voegelin finds the key to Jonathan Edwards's thought in his departure from Calvinist dogma and the open embrace of a pantheistic mysticism

especially in his late work. Voegelin sympathetically and powerfully relates Edwards's philosophizing to the subsequent thought of Charles Peirce, to William James's pure experience and pluralistic universe, and even to George Santayana's metaphysics, to find it uniquely and representatively American. Thus, Voegelin writes: "In the United States . . . ideas did not follow any skeptical tradition but worked with the '*openness*' of the self; the naive juxtaposition of God and man remains intact" (CW1, 140–42, italics added).

Five years later, in confronting Nazi race theory and its perverse reductionist biologism, Voegelin declares that the knowledge of man has come to grief and looks to Thomas à Kempis for succor. The primal image is evoked in Jesus:

Man must live according to the example of Christ and follow him. . . . Every day is to be lived as if it were the last, and the soul should always be anxious for the world beyond the senses. Perfect calm of the soul can be found only in the eternal gaze upon God. (CW3, *History of the Race Idea*, 4)

Five years later, Voegelin concludes his little *Political Religions* book with a Jeremiah-like evocation of spiritual fervor by quoting the admonitions of the anonymous fourteenth-century mystic known only as the Frankfurter, and his *German Theology* condemning as satanic the new Nazi religiosity (along with similar movements): "The inner-worldly religiosity experienced by the collective body—be it humanity, the people, the class, the race, or the state—as the *realissimum* is abandonment of God . . . [it] is anti-Christian renunciation" (CW5, *Modernity Without Restraint*, 71).

Many other examples come to mind, of course. The very opening line of *Order and History* (written in 1956) glows with the insight of the mystic philosopher and is unintelligible apart from its illumination: "God, man, world, and society form a primordial community of being." In the preface to the book occurs a definition indicative of the meditative scope of the enterprise: "Philosophy is the love of being through the love of divine Being as the source of its order" (CW14, 39, 24).

Nearly a decade later on (1964), in his lectures introducing political science to students in Munich, Voegelin stressed the ontological perspective controlling the discourse and the ambiguity of the term *present*, which can mean a point lying between past and future and the

other meaning of the present, in which the present is always related to the existence of man in his presence under God. [Thus], while existing and acting in immanent time—man [also] exists under God, he has presence [so that everyman lives not only] within the immanent process [but also] under the judgment of the Presence. (CW31, 71)

This abiding dimension of reality is sturdy enough to withstand all human rebellion, as Voegelin stresses. “Even if Hegel, Marx, and Nietzsche thoroughly murder God and explain him away as dead, divine Being remains eternal and man must still get on with living his life sealed by his creatureliness and by death” (CW31, 262).

Finally, twenty years later in his deathbed meditation “Quod deus dicitur” (1985), the old mystic philosopher finds in Anselm’s *Proslogion* the optimal form of philosophizing itself whereby the open inquiry into the heights and depths of reality arrives at the pinnacle moment as the meditative consciousness prayerfully attains the limit of the soul’s noetic ascent: ““O Lord, you are not only that than which a greater cannot be conceived, but you are also greater than what can be conceived.”” Voegelin comments,

The noetic quest of Anselm thus assumes the form of a prayer for an understanding of the symbols of faith through the human intellect. . . . The true source of the Anselmian effort [is] the living desire of the soul to move toward the divine light. The divine reality lets the light of its perfection fall into the soul; the illumination of the soul arouses the awareness of man’s existence in a state of imperfection; and this awareness provokes the human movement in response to the divine appeal. (CW12, 383)

By Voegelin's analysis, a theory of politics if it penetrates to principles must at the same time become a philosophy of history (CW5, 88). This, in turn, is conceived not as an account of pragmatic events but essentially as an account of participatory experience of divine disclosure with the ineffable thereby becoming effable in the metaxic reality of divine-human participation over time and, thereby, an ontology empirically grounded in theophanic events. This differentiating unfolding of experience is the source of truth and order in politics and history as it becomes articulate in the lives and work of the great contemplatives from its mythic beginnings through individual philosophers' noesis and the revelatory experiences—symbolisms of individual prophets and apostles in the Judaeo-Christian horizon—with comparable *equivalent* events discernible in other civilizational horizons. The differentiating movements are not a simple progression but are marked by complex contracting defections from truth through corruption, concupiscential rebellion, egophany, and various other derailments that structure the dynamics of existence including those mentioned as reductionist and immanentist. The open quest for truth-reality produces no system to end all systems but continues into the present as a living search for order in the various modes of participation identified especially with philosophy and revelation in the West and with the great spiritualists of other traditions such as Confucius, the Buddha, and the Hindu meditatives. The privileging of philosophy does not amount to Eurocentrism but to a recognition of the noetic superiority of the life of *Reason* as it emerges from the whole of human contemplative endeavor evinced over time as indispensable in the process of reality-experienced. Of this singularity Voegelin comments,

[T]he *Analytica Posteriora*, the fundamental work on analytical thinking to this day, was created, not perhaps in China or India, but in Hellas . . . the Europocentrism of position and standards cannot be abandoned by the philosopher of history, because there is nothing he could put in its place. History is made wherever men live, but its philosophy is a Western symbolism. (CW15, 90)

Voltaire, François-Marie Arouet

François-Marie Arouet Voltaire (1694–1778) is often considered a leading figure in the French Enlightenment as well as the quintessential Frenchman. This characterization seems odd given that he had to live in exile in England between 1726 and 1729 and that he stands apart from many Enlightenment thinkers in his rejection of pure rationalism and embrace of reasoned action that does not attack traditional mores or cultural norms. Thus, Voltaire is a complex figure whose contribution to political theory is not as widely recognized as that of fellow members of the French Enlightenment but is unique and valuable nonetheless.

Voltaire rejected the idea that there could be a rationally constructed political order that could be applied universally. Instead, he embraced the idea that reason could lead to an improved political order but that all reforms would have to be brought about gradually and done within the context of the nation receiving the reforms. For Voltaire, and as suggested by Aristotle, there simply was no one best regime or set of laws since the best was dependent on the character of the people and the condition of the country. Hence, he could support a monarch in France, a parliament in England, or a republic in Geneva. To drive the point home, Voltaire once quipped, when answering why the liberal parliamentary structure in England could not simply be transplanted to the illiberal monarch in Prussia, “Why then are these laws not followed in other countries? Is that not the same as asking why coconuts flourish in India, but not very well in Rome?” (as quoted in Williams 1994, 61).

Voltaire was a liberal but not a utopian one; he was very much a pragmatist, and yet his admiration for the English system is undeniable. Despite his personal preference for the English system, he was unwilling to universalize its superiority. In his essay "Government," Voltaire wrote, "In the end this is what English legislation has achieved: the restoration to all men of all those natural rights of which nearly every monarchy deprives them" (as quoted in Williams 1994, 60).

Voltaire's political views were influenced by his time in England. During his exile, he became familiar with the English system through his close affiliation with the Tory statesman Lord Bolingbroke; the author of *Gulliver's Travels*, Jonathan Swift; Alexander Pope; the Whig merchant Samuel Clarke; and other self-proclaimed Newtonians. Voltaire recognized that the success of the English system was dependent on its unique history, and that although it had become liberal, it had for centuries been the home of tyranny, civil war, slavery, and religious persecution. The end of these practices did not come about because of some newly crafted law or institutional arrangement but only after a long, gradual transformation. The strength of parliament did not come overnight but began more than 500 years before Voltaire's sojourn in Runnymede. What was first established in the Magna Carta was not a strong parliament but a set of aspirational guidelines and principles that would work their way into the political system eventually.

Voltaire did not just admire what England stood for, nor did he think heritage could do it alone, but he recognized that the proper system would need to be put into place to maintain and implement the desired reforms. Thus, he advocated political representation and the separation of powers much in the same way his fellow countryman Montesquieu did (Montesquieu, incidentally, also endorsed gradual reform that respected the history and character of a nation and its people).

An embrace of a separation-of-powers model demonstrates Voltaire's skepticism with regard to the perfectibility of government through rational means. No government could be expected to capture Enlightenment principles in a consistent and predictable manner. Therefore, he viewed a government that could limit the illiberal tendencies of the power hungry to

be the most desirable. This view does not preclude the possibility of an enlightened monarch or liberal democracy, only that—all things being equal—a system like the one he had observed in England was generally the most desirable. As a pragmatist, however, he entertained the possibility that other types of government could also bring about desirable results if they correctly matched the conditions of the country and the people.

War and Political Thought

War and political thought

845

848

War and Political Thought

The starting points in the subject of war have traditionally been Carl von Clausewitz and his seminal work *On War*, which is the only major philosophical discourse on war we have in the modern era, and Sun Tzu's *Art of War*, which is part of the Taoist canon.

From Clausewitz, we derive two received ideas that still dominate military thinking. Not only does war have a nature that never changes over time, but it also has a character that is always changing over time. Clausewitz tells us that it differs from era to era; the Tartars waged war differently from the Romans, and there were even greater differences in the ways nations during the Enlightenment waged war. For Clausewitz, the idea was a heuristic device that helps us to understand that war is protean, and it adapts to its external environment; it changes from culture to culture and within cultures over time.

Clausewitz encouraged us to draw a distinction between the nature of war and its character because of his own philosophical frame of reference. German idealists such as Immanuel Kant and Georg Wilhelm Friedrich Hegel set out to invest traditional kinds of knowledge such as religion and history with an essential "core" or "nature." Behind every phenomenon there is a conceptual poetry or essence. Long before that, however, metaphysics, in revealing (to its own satisfaction) the relativity of the world as experienced, had also reasoned out an unconditional reality thanks to which the conditioned reality becomes intelligible for the first time.

The distinction between the nature and character of war is central to modern philosophical thinking on war as a social phenomenon, as opposed to just a historical event. It is also essential to the reasoning of the three most important philosophers to theorize about war, Kant, Hegel, and Martin Heidegger.

Hegel

Like Clausewitz, Hegel gave the French Revolution and the rise of Napoleon a seminal role in the genesis and articulation of his phenomenology of political life. Famously, he glimpsed Napoleon under his window at Jena at the precise moment in which the preface to the *Phenomenology of Spirit* was being completed. It served as an iconic coincidence. Philosophy had achieved its purpose at the moment at which history approaches its end.

Hegel had seen the force of ideas—the French revolutionary slogan “Liberty, Equality and Fraternity” carried by force of arms across Europe. Napoleon’s very possibility, thought Hegel, taken in its broadest theoretical and empirical sense, marked the fulfillment of humanity’s historical destiny, the story of freedom becoming conscious of itself. He had witnessed the *Geist* of freedom, as well as the *Volkgeist* of the German nation forged in a war of national liberation against Napoleon. From this perspective, he ingeniously, if implausibly, was able to deduce the invention of firearms. Instead of fighting face to face, in hand-to-hand combat, modern soldiers were now prepared to die anonymous deaths, turning personal valor into a more abstract form (Franco 1999, 333). His bold attempt to make war an agent of transcendent history suggested that both the *Volkgeist* and the *Geist* could ultimately be reconciled through the medium of the state, and that war between states could be mediated through international law. In that sense, war could indeed remain an intensely ethical activity.

After all, it was only through finding the true end of their existence in their relationship to the “civil society” that Europe constituted that its respective states could achieve “a life of self-conscious freedom.” In their discourse of war, grounded as it was in reason, not passion, there could be no place for

hatred or revenge, two of the existential emotions that when given unlimited expression make wars so difficult to control.

In short, Hegel took his cue from Niccolò Machiavelli's view that there are two ways of fighting: by means of the law or by means of force. The first belongs to humankind and the second to animals. What distinguished law from force, Hegel added, was that the possibility of peace is retained. Even in war the peace of family and private life is inviolate (Wyschogrod 1985, 130).

And what of Clausewitz? There is no evidence that he attended Hegel's lectures in Berlin and none that he read any of the philosopher's works, most of which were published posthumously by his students from his lecture notes. In any case, his interest was more modest. For Hegel, war could become an instrument of human transcendence; for Clausewitz, war could become an instrument of the preservation of the state system, provided its logic was understood. In other words, while Hegel tried to force the logic of the state to come to terms with the phenomenon of war, Clausewitz tried to make war conform to the needs of the state. This seems to have been the fundamental meaning of his most famous aphorism that war is, or should be, "a continuation of politics by other means." What neither thinker foresaw was the coming of a war without rules. Yet that is precisely what came to pass in the two world wars that harnessed technology to ideology in a particularly lethal fashion.

Heidegger

Karl Marx had been aware of the new challenge the Industrial Revolution had raised: The world was beginning to change within an individual lifetime. Thinking about the future, especially whether the nature of war might change with the advent of new technologies, had become a response to the demand of the times—the need to think through individual survival. But it took Heidegger, a philosopher from the twentieth century, writing in the shadow of the atomic bomb, to take Marx's critique to its furthest conclusion; it was he who introduced the word "technology" into common usage. Before that, the "practical art" or "applied sciences" or

“engineering” was commonly used to designate what we now call “technology.”

Heidegger recognized that the essence of technology is not *technological*. Its essence is the way it changes our relationship with the world, as well as our relationship with others, and that is especially true of its role in war. It gets us to see the world around us differently. Technology is not an artifact; it is a way of *thinking* about the world and our place in it. The Greeks had a more harmonious relationship with nature than we do. Consider, Heidegger invites us, the contrast between an old wooden bridge that lets the river run its preordained course while we cross it in safety and a modern hydroelectric dam that turns the river into a resource to be used as we wish (Young 2001, 38). What interested Heidegger most was not modern technology itself, although he considered it more violent than the ancient: A bulldozer can do more damage than a spade. Ultimately it is the use to which we put it that constitutes our relationship with the world. What is the ground, Heidegger asks, to the violence we do to the world, the violence of a nuclear war, or the everyday violence to nature? For Heidegger, modern war had been reified at Hiroshima in 1945, where its destruction represented the complete triumph of technical instrumental reason. In the late modern era, the will to power has become the standard of all human conduct. The total rationality of means had been accompanied by the total irrationality of the ends, and that included refashioning of matter that made atomic warfare possible.

It was only made possible by atomic physics, the most radical and specialized science of the day. The A-bomb broke with the past, with the Newtonian killing systems, such as ballistics, chemistry, and aeronautics, all of which can be seen as extensions of the gunpowder “revolution” of the sixteenth century. The bomb that was dropped on Hiroshima did not explode because of the blending of chemicals; it exploded because of a humanly engineered change in the nature of matter.

Like every philosopher since Aristotle, modern philosophers believed that the only purpose of war was peace—a better kind of peace, or peace on one’s own terms. It was Kant’s great contribution to that debate to insist that “no state at war with another shall permit such acts of hostility as would

make mutual confidence impossible during a future time of peace” (Humphrey 1983, 129). Reason dictates that we wage war in such a way that ensures that peace remains within our grasp at all times. We should never release passions and hatreds that cannot be contained.

Kant

Kant’s injunction reflected a major change in thinking: The Enlightenment replaced the framework of a common morality with the framework of a common civilization that was sustained by international law and common codes of conduct in war. With the optimism demonstrated by such Enlightenment thinkers as David Hume and Adam Smith, Clausewitz too had no doubt that the Europeans had finally learned an important lesson from their own history:

If . . . civilised nations do not put their prisoners to death, or devastate towns and the countryside, it is because cleverness plays a larger part in their conduct of war and has taught them more effective ways of using force than such a crude expression of instinct. (Heuser 2002, 51)

Indeed, Clausewitz expected that cleverness in political life would continue to increase as societies developed and learned even more. Adam Ferguson had earlier contrasted the “civilised or polished” nations such as his own with the “barbarous or rude” nations of the premodern era. What made the former more civil was their discretionary use of violence. “We have mingled politeness with the use of the sword. We have learned to make war under the stipulations of treaties and cartels and trust to the faith of an enemy whose ruin we contemplate” (Ferguson 1969, 267).

Kant was expressing two ideas here, both of them modern. The first was that we do not become better people, but history and its study do make us better informed. From a reading of history, we know what consequences will follow from acting badly. “Savage” people, by contrast, are history-less—in both senses of the word. Not only do they not make their own history (it is made for them by others), but also they do not make it because they

have no written records and no great historians to instruct them in the ways of the world. Second, the idea that we do not need to separate ethics from politics (in this case, war) stems from the understanding that ethics inheres in the practice of war itself—it is an idea that comes from the political framework of his age. It also emerges in a famous paragraph from *The Philosophy of Right* where Hegel tells us that the origin of the (modern) state as a “self-organising rational and ethical organization” can be traced back to the breakdown of religious unity in the West (Gillespie 1984, 59).

Conclusion

Therefore, ethical constraints no longer came from without (from God) but from within—from politics. The first and most important precondition of the modern concept of the state is the formation of a distinctive language of politics. In other words, for modern politics to be made possible, it was necessary to accept the idea of the state that presupposed that political society was held together solely for political purposes (Pizzorno 1995, 77). To claim that the “political” was merely another name for the “temporal” (the Middle Ages) or the “royal” (the age of Absolutism) would be wrong. The emergence of the “political” we associate with the emergence of the “citizen” (as distinct from the “Christian” or the “subject”). The political sphere is modern and ethical at the same time. Ethics inheres in the political practice of forging and keeping together a state divided by class and conflicting interests. The aim, claimed Marx, was to create an *i llusionische Gemeinschaft*—an illusory society held together by certain foundational myths (Pizzorno 1995, 77).

Unfortunately, both world wars tested not only the effectiveness of armies in the field but also the viability of entire societies (those “imagined communities,” as Benedict Anderson calls them) and their way of life. What occurred was what Clausewitz had predicted would happen if combat were no longer guided by “the will of a leading intelligence,” but if war were to become “its own independent will.” The outcome would be “a complete, untrammelled, absolute manifestation of violence,” as was to prove the case in the war-torn twentieth century.

849

Washington, George

George Washington (1732–99), known to his contemporaries as the Father of His Country, has also been called the Indispensable Man of the American founding. Indeed, his public career spanned the second half of the eighteenth century. During that time, Washington became the most visible embodiment of the political thought of the American Enlightenment.

Washington's public career began in 1754 when, as a Virginia militia officer serving the British crown, he started a skirmish with French forces on the Pennsylvania frontier that eventuated in the French and Indian War between Britain and France. In 1758, he was elected to the Virginia House of Burgesses, where he remained until 1774. Denied a royal commission in the British army, Washington resigned from the Virginia militia shortly before his marriage to the widow Martha Custis in early 1759 to concentrate on planting and public service, including politics and the Anglican vestry. During the decade 1759–69, he continued these pursuits. By 1769, Washington the burgess had become disaffected with aspects of British rule, and he began to support economic and political resistance. He was elected to the First and Second Continental Congresses in 1774 and 1775, and served as Commander of the Continental Army from 1775 to the end of the Revolutionary War in 1783. Washington resigned his commission in December 1783 and returned to his plantation, Mount Vernon. Worried that the confederation of newly independent American states was weak and unstable, Washington reluctantly accepted appointment to the Federal (Constitutional) Convention in the summer of 1787, over which he

presided. After working behind the scenes for ratification of the Constitution, Washington was unanimously elected the first president of the United States early in 1789. He served two terms and chose not to stand for reelection in 1796, when he issued his farewell address, a compendium of eighteenth-century American political thought. Washington died suddenly at Mount Vernon in December 1799. During his public career, Washington embodied the three dominant political philosophies of the American Enlightenment era: classical republicanism, Enlightenment liberalism, and Protestant Christianity.

To many, Washington uncannily resembled the ancient Roman general-turned-farmer Cincinnatus. In behavior and even appearance, Washington modeled classical republican political and ethical virtues. His seeming disinterestedness, demonstrated by his resignation from the Continental Army, his professed unwillingness to assume the presidency, and his retirement after two presidential terms were supreme examples of his apparent reluctance to hold power. Washington's emphasis on the public good, and political happiness as the end of government, were Aristotelian. His conceptions of individual and corporate happiness were also strikingly similar to those of the Roman Seneca, whose *Morals*, abridged and in English translation, were evidently studied by Washington. His emphasis on disinterested public virtue, or willingness to subordinate personal happiness for the public good, was reminiscent of the virtue praised by Cicero, the first father of his country (*pater patriae*) in Rome.

Washington added the political elements of Enlightenment liberalism to his classical republican political morality and theory. He invoked principles from British liberals such as John Locke and Algernon Sydney to argue against the administration of George III from the mid-1760s to the mid-1770s. By 1774, Washington was labeling administration policies "not only repugnant to natural right, but subversive of the laws and constitution of Great Britain itself" (letter to Bryan Fairfax, August 24, 1774). During the Revolution and his presidency, Washington sought to secure the natural rights recognized by Enlightenment liberals to "life, liberty, and property," as he put it, for the American people.

Washington was a lifelong Anglican, although the evidence for his orthodoxy is ambiguous. Even so, he was a thoroughly religious man who in his political rhetoric quoted the Bible more than any other single source, borrowed liberally from the Anglican *Book of Common Prayer*, and was firmly convinced that a benign Providence ruled the affairs of nations and had presided over the birth of the United States. His Circular to the States (1783) stressed the social benefits of “the pure and benign light of Revelation” and recommended imitation of the characteristics of “the Divine Author of our blessed Religion” for Americans’ political well-being. In his farewell address, Washington memorably insisted that “[o]f all the dispositions and habits which lead to political prosperity, Religion and morality are indispensable supports.”

That Farewell Address contained the core principles of Washington’s political philosophy: union, liberty, and self-government under the Constitution, administered with virtue as an example to the world, all under the superintendence of a benevolent Providence. These principles collectively made up the political polestar of his 50-year public career.

850

Webb, Sidney and Beatrice

In the development of both reformist socialism and British social historiography, Sidney Webb (1859–1947) and Beatrice Potter Webb (1858–1943) were significant individuals, as well as being a married couple (from 1892), intellectual partners from slightly earlier, and the joint authors of many encyclopedic volumes. Their contribution to modern political thought included important reflections on the relationship among liberalism, social democracy, and communism, and on education, public services, and industrial democracy.

The Webbs first met in 1890 and soon established a strong political rapport. Sidney received his early education in London, Switzerland, and Germany, but his lower middle-class family was insufficiently affluent for him to study as a full-time undergraduate, and so, in 1886, he completed a part-time, external degree in law at the University of London while working as a civil servant. He subsequently became a full-time writer. In contrast, Beatrice Potter was the largely self-educated daughter of a wealthy businessman, who achieved financial independence thanks to a significant inheritance from her father in 1892, and she was originally less inclined toward party politics. Beatrice is usually seen as the leader of the partnership, and both her early writings on poverty and her first book, *The Co-operative Movement in Britain* (1891), are classics of their particular genres. However, Sidney was a notable figure in Liberal and Labour politics for more than 50 years; produced a significant, independent body of writing on many subjects; and in later life (the 1920s and 1930s) served as a Labour

MP, a peer (Baron Passfield), and a government minister. He established himself as a significant political writer in the 1880s, largely thanks to his association with the Fabian Society, writing many pamphlets on their behalf, including the most successful early Fabian Tract, *Facts for Socialists* (1887). While the young Beatrice worked closely with Herbert Spencer, Sidney was influenced by another important strand in Victorian social science, and concluded that the moral goals of positivism were better expressed through limited collectivism and municipal socialism than the original Comtean utopia. Subsequently, Sidney served as a London County Councillor (1892–1910), and his interest in secondary and technical education indicated a concern for “culture,” as part of “the good life,” which was often lost on his critics.

Within the Fabian Society, Sidney argued for a policy of “permeation,” which involved seeking to convert the Liberal Party (and other nonsocialists) to various collectivist policies on “practical grounds.” He worked in uneasy tension with “labourists,” who favored closer links between the Society and the organized labor movement. The Webbs originally assumed that the “zeitgeist” favored their pragmatic brand of collectivist politics, but the failure of their campaign to reform the Poor Law (1909–13) led them to reassess the strength of capitalist interests and to look more sympathetically on trade unions. They joined the Labour Party in 1914 and subsequently played a major role in the debate about the 1918 Party constitution, which included the famous (but ambiguous) “Clause Four,” which summarized the parameters of party policy on public ownership.

Webbian history—for example, *English Local Government* (11 volumes, 1906–29)—always had a strong political dimension and was distinguished by thorough empirical work and a sophisticated conception of sociological function, which owed much to Spencer’s synthetic philosophy, although the Webbs disputed his laissez-faire conclusions. Early Fabianism involved a deep respect for the unitary sovereignty of a democratized Parliament as the single legitimate agency of legislative change, and the Webbs subsequently became involved in the debate with the “Guild Socialists” about pluralistic socialism in their “corporatist utopia,” *A Constitution for the Socialist Commonwealth of Great Britain* (1920), where this approach was

questioned. Finally, after the collapse of the second Labour government in 1931, the Webbs became increasingly intrigued and impressed by the Soviet Union and produced the classic text of Western intellectual “fellow-traveling,” *Soviet Communism*, in 1935.

The overall contribution to Western political thought made by the Webbs was by no means original, but their ideas about the organization of social services and the application of the concepts of representative democracy and pluralism to economic life are still worth studying today. Webbian socialism, in all its manifestations, was economically egalitarian but politically elitist; by those on the far Left, it has always been seen as a reformed capitalism and not really socialist at all.

Weber, Max

Max Weber (1864–1920) was born in Erfurt, Germany, on April 26, 1864, and died on June 14, 1920, in Munich, having inspired many through his academic teaching and practical example. Weber's world was a world in flux, and in this he was certainly a man of his times. What many historians have interpreted as an age of bourgeois nervousness or even illness seems apposite to someone whose daily functioning often embodied a mixture of drugs, rigid self-control, sexual dysfunction, and dramatic (even dramaturgic) energy, and who was able to amass a body of work in a short lifetime that surpasses many who might work for twice as long in both range and depth (cf. Marianne Weber 1995; Radkau 2005/2009; Mommsen and Osterhammel 1987). He straddled the technical fields of ancient and agrarian history, medieval trading companies, the historical and conceptual study of law and political economy, and the origins of music, and he conducted path-breaking surveys on rural labor and the psychophysics of industrial work, planning further studies of the press and the state. He also wrote volumes of (often tortuous) prose on methodological problems of interpretation, undertook major defenses of academic freedom, and learned enough Russian to draft political journalism first on the 1905 revolution and then on the revolution of 1917, the former appearing in the major journal he co-edited. And in that journal, he premiered a dazzlingly provocative thesis about the affinity between capitalism and the so-called ethic of Protestantism (Ghosh 2008).

That text, although still much misunderstood, confirmed his status as a heroic founding father of sociology. Yet he lectured and was primarily employed in the fields of finance and political economy and only toward the end of his life thought of taking a chair in sociology. His move toward an obvious and recognizable “sociology,” although he was always interested in the forms of social action, occurred only late in life. It came after he had devised and constructed the framework for an updated handbook on social economy [*Grundriss der Sozialökonomik*] that he wrote much of himself, after conceptualizing a sprawling work on *Economy and Society* [*Wirtschaft und Gesellschaft*], and writing as a practically syndicated journalist on German politics. For the study of political thought, what is of most obvious interest is either Weber’s own politics or his hugely polemical lectures on the vocation of the scientist and the politician (Weber 1946, 1994). It is the latter that this article focuses on. For although he thought himself a signal failure at politics, his reflections on the topic are among his most luminous, and they act as a filter not only to explain his broad thoughts on social and political action but also as a lens through which to reflect on his own political theory (Hennis 2000a, 2000b).

Politics and the Political

The idea of a discrete sphere of the political is a Germanic idiom, which although it has become famous through the work of Carl Schmitt, was actually of central importance to Weber (Kelly 2003). This centrality stems from his attempt to delineate the sphere of the political as part of a desire to anatomize and theorize politics within the wider sphere of social action that concerned him. This focus lends his work a powerful conceptual as well as contextual focus (Beetham 1985). Indeed, Max Weber’s celebrated lecture on the vocation of politics, given during the fiery days of the Bavarian Revolution in late January 1919, sought to do what had by then become typical of his work. He first tried to becalm his audience (or readers) by disabusing them of any apparently political subtext to the sober and scholarly aspects of his theme. What constitutes the proper sphere of politics is a subject with a history, he suggested, and that history can be traced in the rise of the modern, autonomous, bureaucratic state whose rational legal authority has, for the time being, trumped earlier forms of charismatic or traditional political leadership. The central question arising

from this view concerns both why and how this particular form has come to be favored, in what contexts, and with what implications. For if there are certain “objective” tasks that politics in general, and political actors in particular, have to accomplish, then we shall want to know to what extent political form helps or hinders their completion.

Having established that the number of political forms that any “state” (or political association [*Gemeinschaft*]) can take are finite, Weber’s principal attention focused on the specific demands of politics. It involves leadership, and the practice of politics to a large extent must therefore provide an appropriate mechanism of leadership selection. Therefore, political form primarily matters to the extent that certain forms are better able to produce leaders whose skills are appropriate to the demands of political action under particular forms of society. For example, he celebrated the nineteenth-century English Parliament as a school of hard training, where prospective leaders had to acquire the basic skills of politics through committee work, legislative diligence, and political maneuverings. This slow boring of hard boards became a standard against which to measure the failings of contemporary German parliamentarism. For although the sphere of the political was the sphere of leadership, its tasks for Weber also included the need to maintain the honor and glory of the German nation-state (Mommsen 1984). This position was a standard but also a Machiavellian-sounding claim, even if *fortuna* was occasionally redescribed to suggest that the German nation was destined to become a nation of masters. If that claim was accepted, then certain political consequences flowed into Weber’s Nietzschean updating of politics, which can present itself as an obnoxious form of racial and Social Darwinism. Yet this implication was at odds in general with the way he approached questions of race and nation. The fact that these tensions coexist in his scholarly and political work illustrate precisely how the demands of political judgment produce and express values distinct from a more sober, academic calculation of facts.

Weber therefore thought that the principal tasks of politics, once the particular shape of the political sphere had been understood and the basic necessities of practical life were established, had to do with the development of a people and with the cultivation of a particular sort of character. This character type would be suited to the demands of modern

democratic politics, which, however, would have to be reconciled with the specialized demands of a modern and disenchanted world. Democracy was therefore both a problem and a solution to some otherwise intractable problems of politics, and indeed for some time, Weber toyed with the idea of making democracy another of his ideal-types of rule, alongside charismatic, traditional, and rational-legal authority. Yet although democracy could not be avoided in an era of mass politics, Weber recognized that democracy facilitated demagoguery. Demagoguery could be made safe for modern politics only by building charisma into the structural foundations of democratic politics. Even this move, however, came with problems attached, for it was not clear that modern parliamentary democracy could produce leaders with even the minimal skill required. Weber in fact ultimately despaired of the fate of democracy in Germany after he had given his lecture, and he came to prefer instead a view of democracy combined with plebiscitary leadership. For this reason, many have come to think of him as a “realist” political thinker.

Weber and “Realism”

The idea of “realism” has two distinct valences in contemporary thought. One implies a classical view of politics as the hard task of rule, necessarily by elites, within which politics is viewed as a continual struggle for power. This might often spill over into war and violence between sovereign states that exist in what is otherwise a tense, interrelated, but anarchic world. A different interpretation concerns more recent political theory, wherein “realism” has come to represent an opposition to the kind of “ideal theory” inspired by the political philosophy of John Rawls, in which technical political questions are bracketed off from irresolvable metaphysical disagreements. Although the first vision is principally associated with a piecemeal incorporation of certain political thinkers into a canon of international-relations scholarship and thematic concerns, and the second with normative political philosophy, both feature a heavily state-centered vision. In this respect, at least, they both hold closely to Weber’s focus, for his political thinking derived from reflections on the nature of the state as the body possessing a monopoly on the legitimate force within a particular territory. This claim, as much as any of the pieces of apparently timeless wisdom offered by Thucydides, Niccolò Machiavelli, or Thomas Hobbes, is

the basis of Weber's realism. He wanted the grand historical sweep as well as the particular normative detail, a sober assessment of the facts within a general theory of political and social action. In brief, he wanted both sorts of "realism." History, he suggested, showed the importance of power and the "irreducible" element of domination [*Herrschaft*] present in any human social relationship, so that political relationships are those that present a certain form of "legitimate" *Herrschaft* within this wider framework of social action. Only by understanding this perceived rightfulness of rule could one look at political questions with a cool objectivity.

This coolness is a natural disposition of the properly political leader. But it signifies at least three things, the first of which is a skill in applying knowledge to practical tasks. This application incorporated classical wisdom offered by ancient political writers such as Plato and Aristotle, for whom leadership required both the political knowledge to rule in general (*politike*) and the practical wisdom (*phronesis*) to know how to rule well in a particular context. Second, the requisite coolness of leaders embodies what Weber referred to as the "tragic" character of all action generally, and political action especially. This focus has been somewhat neutralized in contemporary political philosophy, which refers to the technical and anemic question of whether there really are moral dilemmas at all. The implication is that if there are, then simply recalibrating one's moral compass might allow them to be rendered meaningless. Value pluralism is a muted reflection of this vision, although as some historians have noted, it is a set of ideas with a classical genealogy that is certainly germane to Weber's concerns. It suggests that there are always moral remainders in decision making and that, therefore, there are likely to be serious remainders in political decision making of a consequential character. Here, many equally valued goods have to be traded unequally against one another, with losses noted and consequences dealt with. Weber's account of this sort of dilemma has the tenor of existential provocation as much as sober assessment. The struggle for the soul of the politician could become literally a matter of life and death. The politician would have to separate his or her—mostly "his" in the Western political tradition—own personality and character from his office, but at the same time use his character to pursue a particular cause. He would have to recognize that ideals would be compromised in the grinding realities of day-to-day political life, and in doing so, he must be

able to live with the consequences both as man and as politician. Few would realistically be able to cope, which is why the focus on training and discipline was so important to Weber. He demanded a twin focus to reconcile the demands of man and politician, and to underpin his celebrated (if theoretically and practically awkward) discussion of an ethics of disposition [*Gesinnung*] and of responsibility [*Verantwortung*]. The former relates to a motivating cause, and the latter to a sober realism in the face of its pursuit, which the vocational politician as opposed to the mere romantic politician, ideologue, or dilettante should take into account.

Putting these ethics in combination thus constitutes something like a third strand of Weberian realism. The politician required both “cause” and objectivity, cool judgment to contain and constrain hot passion, and a sense of how to try and pursue that cause in the face of the necessary compromises, dead-ends, false dawns, tragic conflicts, and unintended consequences that politics provokes. This combination of passion and judgment embodies the ideal political character for Weber, and although it rejects political absolutism absolutely, it nevertheless represents a kind of absolute ideal that the man of vocation has to follow. For Weber, compromise, on the one hand, and the decisive pursuit of national tasks, on the other, went hand in hand. This coupling meant that certain political pursuits were, or should be, already off the table. For example, he vehemently rejected the absolutist tendencies of political radicalism as much as he did the views of those who would reject politics completely. In his lectures on politics, this stance was bound to disappoint a radical student audience. He knew that his savage attacks on Rosa Luxemburg and Karl Liebknecht as political infants were highly charged, as both had been murdered less than a fortnight previously, but this critique was of a piece with his wider position. He thought that politics required a certain view of the world, and what one might today think of as monist (or monomaniacal) political worldviews, whether revolutionary or eschatological, were incompatible with a realistic assessment of politics. The ethics of the Sermon on the Mount, he added in a wry nod to Leo Tolstoy, was a thoroughly honorable ideal, and it had moved mountains in the past. As a political ideal for a godless world, however, it was literally (to say nothing of metaphysically) hopeless. To engage in such a religious rejection of the world was the sort of thing that no self-respecting politician could ever

countenance. One could not turn away from evil in politics, as Weber accused various of his colleagues of doing, for the real politician had to stare it down and match its force with something similar or better. To reject the world as it is required a self-confidence and self-consciousness that few possessed, but it often involved a juvenile form of hubris, or so he suggested. Following an ethics of disposition in fields apart from politics might be enough, but because politics needed responsible conduct that benefitted huge populations, such simplicity was unhelpful. Nevertheless, Weber's particular form of realism, particularly his focus on the relationship between character and vocation, had much more general purchase. He was actually making a general point about the relationship between character and action for anyone who had a passion for life, and this point leads on to a further dimension of Weber's political thought.

The Political Life

If the political life in its most obvious sense is the life led by vocational politicians, Weber's vision of politics has a broader focus than just the figure of the political actor. It suggests, in fact, two angles of vision. One is the exemplary character of political action itself. In balancing the twin ethics of conviction and responsibility, in making that infamous plea that in standing here he can do no other, the politician of vocation lives for and not from politics, and his presentation of self is both heroic and ideal. A second angle focuses more generally on the appropriate relationship between a character type (in this case, the politician) and the particular sphere of engagement (politics). Although this particular illustration is specific, the structure of the argument can be generalized: Social action [*Soziale Handeln*] generally requires an agent to calibrate his or her particular character with the demands of the specific life-order [*Lebensordnung*] or vocation he or she wishes to pursue. Thus, in this second sense, the life led politically might not necessarily refer specifically to a life in politics but could simply designate the appropriate balancing between character and vocation that all agents must ideally seek if they are to find meaning in the world. Distinguishing between the political life and the life led politically seems to fit with Weber's general approach to historical study through the use of "ideal-type" examples, which could generalize abstractly from the mass of particular details, to throw into sharp relief specific issues and

interpretations. Such objectivity was not a form of neutrality because even the most abstract exercise in concept formation requires the analyst to choose what will and what will not constitute appropriate evidence and signal meaning. It is, rather, an illustrative device designed to govern otherwise chaotic material, and the vocation lectures fit well into this perspective. So too does his cognate recognition of the unreality of the figure of *homo economicus*, for example, at the same time as he praises its analytical or heuristic usefulness.

Applied to particular individuals, this view can have valuable analytical purchase. Thus, the figure of the vocational politician might receive some sort of embodiment in certain figures (perhaps Pericles, Otto von Bismarck, or William Gladstone, to use Weber's favored examples), but in a broader sense, the vocational politician is itself an ideal-type and so too are the scientist, the artist, the musician, and so forth. In fact, in Weber's other great "vocation" lecture, concerned with the vocation of the scientific life [*Wissenschaft*], he is clear that the scientist must reconcile his own character to the demands of an intellectual life, and that he cannot pursue political goals directly even though he might, more or less consciously, contribute the new instrumental understandings of how those goals could be achieved. One must not use the academic lectern as if it were a pulpit from which to try and persuade an audience as to what they should think, but instead one must aim only to impart the particular facts of a situation and the various theoretical ways in which one might understand and interpret them. Lying behind this stance was a contemporary rejection of the so-called "socialists of the chair" [*Kathedersozialisten*], which culminated in a passionate defense of academic freedom and the plight of his friend, Robert Michels, whose politics he would himself come to disagree with radically. The vocational demand for truth and intellectual integrity had to stand above political posturing by academics. Weber seemed to foresee the disputes over "political correctness" of a century later.

Like the politician and other character types, scientists have their own inner demons or causes to serve, and once again, only a few possess enough awareness and ability to come close to the ideal of the man (or woman) of vocation. If what Weber had to say was necessarily disappointing to his audience, it was both because he refused to either proselytize or offer easy

answers. Instead, as a scholar, he posed questions and offered interpretations. He could not resist laying out the general challenge, though, of asking how his audience would maintain its own character in the cold-hearted bureaucratic future that lay ahead. In so doing, Weber illustrated a tension at the heart of his architectonic focus on the relationship between character and vocation. By asking about the possibility of upholding character under the freedom-destroying bureaucratic ravages of rational-legal capitalism and the state, Weber brings out his own difficulty in upholding a fact-value distinction he sought academically to maintain. Even if one thinks it possible to uphold the distinction, Weber so often directly contradicts his own tenets, even when talking about dry methodological issues, that it is difficult, without stretching the evidence to the breaking point, to view him as a wholly successful neo-Kantian, as some scholars do. His approach is more traditional, in fact, and much more in tune with an idea of political realism. Indeed, Weber's politics seemed to impinge at all times, even as he endeavored to separate politics, morality, and analysis largely because all of his works took their cue from thoroughly practical problems.

He rejected idealism in all forms, sardonically suggesting that one could follow either Hegel or the way of thinking opened up by political economy. Weber's way of treating things was derived from the classics, from law and political economy, and most especially from the legacy of Karl Marx and Friedrich Nietzsche, neither of whom any modern scholar could hope to avoid, or so he said. Weber followed Nietzsche into an examination of his increasingly specialized, nihilistic world and looked for practical resolutions that did not necessarily require resorting to some kind of superman [*Übermensch*]. His recourse to plebiscitary leadership democracy, in the eyes of many, suggests a failure to resolve the problem, but this criticism is not entirely right because he also followed Marx in seeing the condition of the working class as a central problem both of and for modern mass-based politics. Weber's conclusions suggested that sensible political leadership, rather than revolution, might provide answers, through educating citizens and adapting charisma to democracy. Because he rejected the conclusions and prescriptions of historical materialism while prizing it as a method, the importance of Marx to his thinking is often misjudged.

Combining Weber's political and intellectual radicalism with something approaching an ancient sense of politics might even lead us to locate him in the company of what many today would think of as republican political criticism. An ancient sense of politics according to Weber, though, has more to do with maintaining honor and *fama*, reputation and credit, statesman-like wisdom, than avoiding domination or arbitrary power. He showed no consistent concern over the effects of domination on social policy or social politics [*Sozial politik*]. Given his Machiavellian view of the necessity of politics, of the judgment of consequences rather than of intentions, of the capriciousness of fortune, and of the hard task of keeping a straight course under modern conditions, a politics based on good intentions and the avoidance of domination was no politics at all. Such naïve hope, he argued, simply left the masses open to manipulation by the worst forms of charismatic demagoguery without any plausible defenses, and it left political leaders weakened when the inevitability of compromise, defeat, and rejection naturally came around. What was likely to become of a modern bureaucratic politics in the West he did not know, but he saw its origins as unique, as derived from what modern political scientists came to refer to as a specific path-dependency. The specificities of capitalism as a cultural form engaged Weber's interest precisely for these reasons, and his political thought represents one of the most profound attempts to come to terms with its implications, its limits, and its possibilities (Scaff 1989). His thoughts equally provide a legacy with which we have yet to fully come to terms.

Weil, Simone

Weil, Simone

855

856

Weil, Simone

A significant political philosopher of the twentieth century despite her short life, Simone Weil (1909–43) chronicled the rise of fascism in the 1920s and 1930s and turned critical attention to the concepts of oppression, human compassion, and the need for justice. Her life and work project her uncommon insights into our common life. She was a profoundly original political thinker and educator. *Welfare State, Theories of the Whose Body of Work* is moderately large. Her most sustained and politically provocative works are *The Need for Roots* and *Oppression and Liberty*, while the most personal and penetrating are *Waiting for God* and essays titled “Are We Struggling for Justice” and “The Iliad, or the Poem of Force,” and several essays collected in *Selected Essays* (1934–43).

Although born a Jew, Weil writes that, “From earliest childhood I have had the Christian notion of charity for one’s neighbor, to which I gave the name of justice, as the Gospel does in several places and which is so fine” (Avery 2008, 22, and the preface to Bell 1998, xii).

Weil makes us acutely aware of human abuse of power and the resulting fragile nature of our civic order; she reminds us of the suffering and injustice that accompany our having abandoned any spiritual roots that may have earlier informed our moral and political thinking. Some 50 years after Weil’s death, Václav Havel, writer and president of the Czech Republic, lamented our loss of a spiritual language in which to frame our political discourse. He argued that we have all but destroyed our ability to talk of

politics and public policy in any transcendent idiom. Weil, along with some contemporary thinkers like Havel, provides us with a new, broadly spiritual way of casting our moral and political discourse as it impinges on policy and daily life. It is this reformulation of moral and political discourse and action in a spiritual framework that distinguishes Simone Weil's writing from most others.

In her final London writings, Simone Weil says that the first duty of education is to remind its children "ceaselessly" to be attentive "in order to be just." Attention is primarily an individual act, while justice necessarily involves human relationships at various levels of order and responsibility among their members. Weil would likely critique our rapid-paced, digitized, commercialized society *because* our capacity for attention seems to have greatly diminished. In our haste, we have all but lost the art of listening and attending to one another, and justice and the quality of our civic life are victims of this diminishment.

Attention is one of Simone Weil's hallmarks; it manifests itself in compassion, which in turn evolves toward a new virtue of justice, in which the work of justice goes hand in hand with compassion, which go hand in hand with trust mercy, development, and reconciliation. Unfortunately, Simone Weil's death came early. She refused to eat more than the poorest of her fellow French brothers and sisters were rationed during the war. She died of malnutrition.

Welfare State, Theories of the

Many of the central building blocks of today's economically advanced welfare states were put into place in the late nineteenth century and consolidated in the first decades of the twentieth century. It was, however, during the long period of sustained economic growth between the 1950s and 1970s that these arrangements expanded rapidly and came into maturity. T. H. Marshall (1950), in one of the most influential theoretical contributions of this period, described the emerging welfare state as the key to full citizenship rights for all members of society.

Marshall famously distinguished among three parts of citizenship, the first two of which were civil rights and political rights. The developing welfare state now added the third element, universal *social* rights, to the status of citizenship. One of the central tasks in early theories of the welfare state was to identify the most fundamental driving forces behind the development of social citizenship in the form of rights to income protection and social services such as education, healthcare, and housing.

The Rise of the Welfare State: Economy-Driven Accounts

One influential theory, advanced from the late 1950s, emphasized the importance of structural changes associated with industrialism. Some authors, such as Harold Wilensky (1975), stressed how economic growth

and demographic developments—a higher life expectancy and a larger proportion of older people in the population—led to a greater demand and capacity for public pensions. Others similarly emphasized the many new social risks associated with the industrial society and the needs of the economy for a well-trained labor force. In short, the welfare state was explained as a functional response to economic development.

Neomarxist explanations for the rise of the welfare state shared this emphasis on structural economic conditions. In these theories, however, welfare-state expansion was interpreted in light of capitalism's systemic needs and inherent contradictions. Capitalism, it was argued, must provide conditions for the accumulation of private capital but at the same time legitimize its defining feature of private ownership of the means of production. In the analysis of James O'Connor (1973), the welfare state served this dual need effectively. Although the capitalist welfare state led to undeniable improvements for wage-earners, it was also associated with new forms of repression and social control. Explaining the power dynamics of the welfare state required understanding that it helped to keep the workers in check and avoided the demand for more thorough forms of social transformation that would threaten the interests of the ruling classes.

However, a number of authors found these types of theory deficient or incomplete. How do we, for example, account for the fact that countries facing similar economic conditions seemed to develop in so very different directions? The preceding theories seemed to explain the welfare state as a more or less deterministic reaction to impersonal economic forces. By contrast, attempts to characterize and explain the differences between different welfare states often led to a shift of emphasis from economic development to the role of political movements and politics more broadly.

How and Why Do Welfare States Differ? Welfare Regimes and Working-Class Mobilization

In *Three Worlds of Welfare Capitalism* (1990), Gøsta Esping-Anderson introduced a highly influential typology that remains useful (if partly contested) for describing some of the key dividing lines and development

trajectories of different welfare states. He argued that the welfare states of the OECD countries could be neatly categorized into three broad regime types. The *liberal*, broadly market-based regime, associated with the Anglo-Saxon countries, provides relatively low, universal transfers and/or means-tested social assistance-based payments under strict conditions of eligibility. It connects security tightly to market participation and ascribes great importance to private forms of income protection and social services.

The *conservative* regime type, mainly associated with continental Europe and strongly shaped by religious movements and institutions, combines corporatist structures of welfare-state security—reflecting existing patterns of labor-market stratification—with the encouragement of traditional family arrangements. Finally, the *social-democratic* regime type, represented by the Scandinavian countries, is committed to relatively generous universal transfers and comprehensive state-subsidized public services. Two important aspects of the last type stand out. It emphasizes family and employment policies in support of women's labor-market participation. It also systematically incorporates the middle classes among the beneficiaries of the welfare state, thereby limiting the demand for private services and social-insurance arrangements.

The shift toward a movement-centered explanation of welfare-state development is well exemplified by Walter Korpi's *power-resources model*. Even in a capitalist democracy, there is, he argued, significant room for trade unions and parties of the political left to shape the decisions of the state through the "democratic class struggle." Indeed, the differences between welfare states in the levels of taxation and economic inequality could, essentially, be explained through the differences in *working-class mobilization* and its impact on the power resources available to labor and capital, respectively.

Similarly, Esping-Andersen argued that the most developed welfare states were those of the social-democratic regime type. "Decommodification" was identified as the central indicator of social citizenship, i.e., the extent to which a person "can maintain a livelihood without reliance on the market." Esping-Andersen concluded that the social-democratic regime type

achieved the highest degree of de-commodification and, so, linked welfare-state development tightly to the influence of social democracy.

Another important theme of theories on the impact of movements and their representation on political outcomes concerns the extent to which different welfare states developed in a (to use Helga Hernes's [1987] expression) "women-friendly" direction, and the role played by women and women's movements to serve this end.

Other contributions defended the importance of politics differently by examining the impact of the *political institutions* within which agents and movements operate. "Institutionalists" of various brands, such as Theda Skocpol (1992), aimed to show how state institutions—with their degree of centralization, the presence of checks and balances, the possibility of smaller parties to gain political influence, etc.—contributed importantly to shape the development of welfare states, as well as the balance of power between different groups. For example, the ways in which *electoral systems* create varying opportunities and obstacles for less-advantaged groups to mobilize, form majorities, and vote, may account for many of the differences between welfare regimes.

Is the Welfare State Desirable? Social Justice and the Critique from the Right

An important issue in theoretical debates over the welfare state is, of course, whether welfare-state expansion is desirable from the point of view of social justice and, if so, when and why. The most systematic attempt at justifying efforts to reduce social and economic inequality during these years of expansion was offered by John Rawls, a North American philosopher.

In his influential book *A Theory of Justice* (1971), Rawls combined a vigorous case for the protection of basic liberties and antidiscrimination measures with the argument that inequality of social and economic life prospects could be justified only if they served the interests of the least advantaged in society. In particular, Rawls pointed to the limitations of

arguments about desert by drawing our attention to the fact that we did not choose the family or social class in which we were born, or the talents with which we were endowed. At the same time, however, Rawls also argued that inequalities may sometimes offer useful incentives and thus that an economy with some inequalities would be preferable to more strictly egalitarian arrangements.

Since the mid-1970s, with the oil crises in 1973 and 1979 as key events, the stability of the postwar consensus in favor of the welfare state began to crumble. In this climate of a general slowdown in economic growth and high levels of unemployment, normative theories associated with libertarian and conservative perspectives gained increasing influence. The works of Friedrich A. Hayek (1960) and his followers provided important sources of criticism against the welfare state.

Hayek was not opposed to all forms of redistribution, but he warned against the consequences of lending the state bureaucracy the discretionary powers needed to apply fine-grained and discriminatory distinctions based on “social justice,” such as criteria of desert or equality. Hence, realizing some of the aims associated with the welfare state would concentrate powers in the hands of the state in ways that were bound to collide with individual liberty. Robert Nozick’s *Anarchy, State and Utopia* (1974) developed a libertarian conception, challenging Rawls’s theory, based on the idea of universal rights to self-ownership. He argued that redistributive taxation of labor income violated these rights and was comparable with forced labor.

Some lines of criticism against the welfare state from the right were less concerned about the dangers of uncontrollable bureaucracy or the size of the state than the ways in which welfare programs were designed. Lawrence Mead has argued in a number of influential works, including *Beyond Entitlement* (1986), that current problems of poverty had less to do with the lack of material resources than with the social problems of the “dysfunctional poor.” Specifically, Mead held that welfare programs with lax or no conditions led to dependency and helplessness and so would do nothing to address the reluctance (or lack of capacity) to use available options for work. His prescription was that these causes of poverty were best addressed by linking financial support to behavioral conditions and

supervision, primarily in the form of requirements to work (or prepare for work) to promote responsibility and competence. This kind of thinking was reflected in the welfare reforms of the centrist-liberal Clinton Administration in the United States in the 1990s.

Austerity, Restructuring, and the Resilience of the Welfare State

Even though the general trend toward expansion gradually came to an end during the 1970s and '80s, theories differ in their assessment of whether the development of North American and European welfare states in the past two decades should essentially be described as retrenchment or restructuring. Some theories about economic globalization argued that increasing capital mobility would make lower taxes unavoidable. Theories of postindustrialism emphasized the importance of the shift from manufacturing to services, and the ways in which the differences in productivity growth between these sectors seems to make the funding of welfare services while maintaining wage equality more difficult. Arguments about aging populations and demographic imbalances seemed to lead in the same direction of austerity, thereby leaving limited room for maneuvering through independent political choices in individual countries.

Contrary to some influential predictions of such theories, however, several authors—such as Paul Pierson (2001)—documented the remarkable resilience of many welfare states, and a number of mechanisms through which they have tended to generate stable political support and survive, even in countries where politicians were explicitly committed to reduce the welfare state. While these theories differ in their analyses and conclusions, they were all part of a new shift of focus, this time away from agents (such as parties and other movements) and back to structural circumstances. Thus, many influential theories on this stage of austerity shared the implication that the balance of power between specific movements was ascribed a more limited role for the explanation of different development routes.

Feminist Perspectives and the Challenge of Sustainability

One of the most striking aspects of welfare-state restructuring over the past few decades has been the change in women's labor-market participation and the different ways in which welfare policy has shaped this ongoing reconfiguration of the relations among states, markets, and families. In this context, scholars of gender and politics have argued that welfare-state arrangements have sometimes played a key role in promoting women's personal independence and have contributed to greater economic and social equality between men and women. However, they have also revealed the gendered bias of key concepts in the welfare-state literature and have examined how welfare states have reflected and often reinforced gender inequalities.

Is it, for example, meaningful or attractive to speak of de-commodification as the key to social citizenship considering that many of the contributions of women were not *commodified* in the first place? Is it relevant or fruitful to speak of "welfare-dependency" in the context of transfers to people without employment when society at large depends so heavily on productive activities performed—disproportionately by women—outside the wage-contract? Theories of gender and the welfare state have shown how previous studies have tended to conceal the experiences and contributions of many women and have highlighted the ways in which welfare-state programs and regime types affect men and women differently.

One further theme in welfare-state theory that is bound to become more important in the years to come is the growing awareness of our global environmental challenges. Narrowly focusing on individual nation-states is more difficult to justify if economies cannot grow without having an impact on the prospects of other economies to develop in ways consistent with long-term, global sustainability. From the point of view of political ecology, one of the key structural problems in existing welfare states is that their financial, social, and political feasibility often seems to depend on, and reinforce, environmentally destructive forms of economic growth. Thus, some of these contributions, such as the works of André Gorz and Philippe Van Parijs, have examined the possible role of unconditional basic income

payments and working-time reductions as alternative—less growth-driven—means of addressing unemployment and promoting social cohesion.

Wells, Herbert George

Wells, Herbert George

860

862

Wells, Herbert George

H. G. Wells was born into a lower middle-class family in Bromley, Kent, on September 21, 1866. After a number of abortive starts in life (draper's apprentice, pupil-teacher, and chemist's assistant), he won a scholarship to the Normal School of Science (now Imperial College), London, to study the natural sciences (1884–87). Although he failed to earn a degree at the Normal School, he subsequently did so by correspondence (1890) and became a school teacher for a time (1887–94) before ill health directed his efforts toward journalism and creative writing, and from 1895, he became a successful author. With the publication of such early scientific romances as *The Time Machine* (1895), *The Invisible Man* (1897), and *The War of the Worlds* (1898), Wells established himself as a man of letters, and his resultant wealth permitted him, from 1900, to turn his attention toward sociological and political concerns.

Although Wells had been active in the Normal School debating society, presenting two papers on “democratic socialism” (in 1884 and 1889), his breakthrough as a serious thinker occurred with the publication of *Anticipations of the Reaction of Mechanical and Scientific Progress upon Human Life and Thought* (1901). In this work and in *Mankind in the Making* (1903) and *A Modern Utopia* (1905), Wells developed his eugenic thought, moving from advocacy of sterilization and poisoning for the “people of the abyss”—the inadaptably poor who are incapable of keeping up with modern social and scientific ways of living—to a greater emphasis on educational salvation and welfare provision for the poor combined with

voluntary eugenics based on the presentation of individuals' medical histories and family pedigrees to prospective mates ahead of any commitment to connubial ties. He also emphasized the need for social reform in areas such as housing and healthcare, and he became a pioneering advocate of the "endowment of motherhood," a form of child support paid to mothers for investment in their children's well-being. Given the establishment of a state protective framework for all citizens, where individuals transgress eugenic laws, such as through the transmission of congenital diseases or the founding of a family before financial viability is established, Wells suggests imprisonment and fines, with other antisocial practices such as alcoholism and gambling also being treated through a liberal "island prison" regime.

Wells continued to promote negative eugenics until 1931, with the publication of *The Work, Wealth and Happiness of Mankind*, although when he turned his attention to the question of human rights during World War II, he condemned any involuntary interference with individuals' reproductive choices and so effectively condemned all forms of eugenics in *The Rights of Man, Or What Are We Fighting For?* (1940).

With his membership in the Fabian Society, Wells gave consideration to his socialist philosophy, initially condemning Fabian gradualism, permeation, and small-scale planning in *Faults of the Fabian* (1906) before presenting his own socialist amalgam in *New Worlds for Old* (1908). Acknowledging the tradition of socialist planning bequeathed by the utopian socialists, praising Karl Marx for democratizing socialism, and citing the Fabian promotion of efficient administration as vital to socialism, Wells introduced the importance of a socialist education policy, and advocated the role of "overparent" for the state, making welfare reform and the protection of children central to his socialist philosophy. *New Worlds for Old* became a best seller, and it was revised for publication on two further occasions (1909, 1914).

Although Wells had advocated a kind of global confederation from *Anticipations* onward, it was during the Great War that his world-state thinking came to the fore. In *The War That Will End War* (1914), he called for the establishment of a postwar "Peace League" and in *What Is Coming?*

(1916), he acknowledged the need for the pooling of sovereignty by nations in the postwar settlement, thus, shifting from a confederalist to a federalist philosophy.

In 1917 he became active in the League of Free Nations Association, subsequently joining the League of Nations Union and co-authoring *The Idea of a League of Nations* (1919) and *The Way to a League of Nations* (1919). However, when the League of Nations was established in 1920, Wells condemned it as a talking-shop for foreign office delegates and considered it worse than no league at all.

With his disappointment at the League of Nations, Wells's campaign for a world state intensified until he came to believe that all power that could be removed from nation-states should be so. From 1923, in *Men Like Gods*, he advocated a functionalist form of world government whereby the world would be run by technical agencies responsible for specific functions such as health, education, defense, and transport—a notion later formulated by the political scientist David Mitrany. He further elaborated his functionalist thinking in *The Open Conspiracy* (1928), *What Are We To Do With Our Lives?* (1931), and *The Shape of Things to Come* (1933). Wells felt that a functionalist system of government would prevent the ascendancy of a ruling elite while binding all nations together through the interlocking nature of the technical agencies and the shared interests nations would have in the agencies functioning effectively. With the outbreak of World War II, Wells saw such a functionalist model as prospective through “war-welded federalism,” as he termed it in *The Common Sense of War and Peace* (1940); essentially the extension of American-British-Canadian wartime supply agencies to the postwar world, administering global reconstruction in the first instance, and maintaining such transnational administration into the future.

As a counterbalance to such transnationalism from above, Wells also advocated educational reform from below, seeking both to eliminate nationalist history and to promote a sort of global patriotism. His educational initiatives initially took the form of representing history, biology, and economics in the form of universal textbooks: *The Outline of History* (1920), *The Science of Life* (1930), and *The Work, Wealth and*

Happiness of Mankind. Having produced such presentational models, however, he subsequently turned his attention to the framework of education and modes of widespread knowledge distribution.

From the early 1930s, Wells advocated the creation of a world encyclopedia that would contain all the intellectual raw materials necessary for individuals to make rational judgments and learn about the ways of the world. Such an encyclopedia, most thoroughly presented by Wells in *The Idea of a World Encyclopaedia* (1936), would be an organic project, being supervised by a transnational agency through a network of academic institutions around the world, and being constantly revised based on new evidence and ongoing intellectual debate.

In addition to developing the idea of the world encyclopedia, however, Wells also sought a means of making it easily accessible to all. From the mid-1930s, he began promoting what he called the “world brain,” an early forerunner of the Internet that would allow users to access the most current information through the distribution of texts and objects via microphotography. As he explained in *World Brain* (1938), Wells considered it feasible to produce and distribute primary and secondary source material in very little time through photographing it and supplying it to libraries and even individuals for use on microfiche or microfilm readers. As with the proposed networking of the world encyclopedia, libraries and subscribing individuals could be supplied with new and revised material through a global “brain organization” that would mediate between the researchers on the one hand and the information users on the other. Influenced by contemporary technological developments employed by the British Library, Wells promoted the “world brain” idea through lectures and journalism as well as through such works of fiction as *The Camford Visitation* (1937).

With the outbreak of World War II, Wells came to realize that his socialist thinking, his world government advocacy, and his educational projects were for naught if the rights of citizens could not be protected from national and transnational abuses. In 1939, he therefore launched his “Rights of Man” campaign that he intended as a safeguard for democracy in the highly bureaucratized world that he saw emerging out of the war. Starting with a

series of letters of to *The Times* in 1939, and further popularized in *The Rights of Man*, Wells oversaw a global brainstorm on issues of right, producing draft after draft of his human rights document, and having it translated for world distribution into dozens of languages. In addition to promoting the right to life, work, and police protection for persons and property, Wells also advocated the regulation of global capitalism through the protection of citizens from the restriction of the distribution of necessities, and the buying and selling for profit where no incremental change to the product has occurred. He also condemned the keeping of secret dossiers and the arrest of citizens without charge, as well as the administration of drugs or medical treatment without citizens' prior knowledge and consent. Wells's campaign influenced President Franklin Delano Roosevelt's "Four Freedoms" declaration and contributed to the development of the Universal Declaration of Human Rights, which was presented to the United Nations by Eleanor Roosevelt in 1948.

On August 13, 1946, Wells died at his London home. Although few if any of his specific causes saw fruition during his lifetime, he can be credited with reintroducing human rights to the global political agenda, and in terms of promoting transnational politico-economic agencies, he was surely ahead of his time and a contributor to the spirit of the postwar age, especially within the European context. By tying education to political reform, and seeing technology as vital to the expansion of knowledge access, Wells's influence remains strong to this day, and may well prove to be his lasting contribution to world culture in the decades to come.

Wollstonecraft, Mary

Wollstonecraft, Mary

862

866

Wollstonecraft, Mary

Mary Wollstonecraft (1759–97) is best known as a forerunner of modern feminism. Her extensive body of work participated in contemporary debates in education, social mores, philosophy, and theology. Wollstonecraft's works include educational texts, two novels, book translations, an account of the French Revolution, a travelogue of her journey in Scandinavia, and the political tracts *A Vindication of the Rights of Men* (1790) and *A Vindication of the Rights of Woman* (1792). In addition, Wollstonecraft was one of the first women to support herself by means of professional reviewing. Her work for the *Analytical Review*, a periodical sympathetic to radical causes, is a key part of her opus. In her reviews of hundreds of texts, we see the development of Wollstonecraft's distinct combination of political argument and cultural criticism, primarily in the form of *literary* criticism.

A Vindication of the Rights of Men

A Vindication of the Rights of Men, Wollstonecraft's first explicitly political work, was written as a response to Edmund Burke's *Reflections on the Revolution in France* (1790), which was in turn a rebuke of British radicals and reformists. Although it was completed in six weeks, this text represents a mature engagement with Burke's complex politics and rhetoric (in comparison, Burke's text was composed in less than a year and Thomas Paine's well-known *Rights of Man* in approximately two months). Burke's primary target was Richard Price, the prominent Dissenting minister, moral

philosopher, and political writer who had previously supported the American revolutionary cause. Price was known as a Rational Dissenter. Dissenters in general were members of religious groups who refused to swear to Anglican articles of faith that were required of all who wished to attend Cambridge and Oxford, and subsequently to make a living as clergy or to take up civic posts. Rational Dissenters in particular developed a theology that was antimystical and anti-Calvinistic and that encouraged a high level of intellectual and worldly activity. The Rational Dissenters ran a number of educational academies and were deeply engaged in the politics of the day, generally drawing from a rhetoric of classical republicanism in support of their criticisms of corruption in the representational system of Britain and the colonies. Wollstonecraft met Price when she came to Newington Green in London—where the Dissenters had established a school and chapel—to start a girls' school in 1783. There, she was introduced to a community with a rich intellectual and political heritage. Richard Price, Joseph Priestley, and James Burgh were three of the more influential Dissenters and were crucial to Wollstonecraft's intellectual development. They added their voices to the reformist and radical movements in Britain during the years of the American Revolution, the French Revolution, through the 1790s. The reform schemes developed by a diverse array of groups at this time shared some common features: that the franchise be expanded, that taxation for military expenditures be subject to review, and that irregularities in parliamentary representation—such as “rotten boroughs” and unrepresented population centers such as Manchester—be addressed.

Burke's *Reflections*, ostensibly an epistle concerning the danger of the French Revolution, is a substantive reaction to British radicals and reformists. Burke argues for the prerogatives of the state church and the king, the socially stabilizing mechanisms of hereditary titles and property, and the preservation of the (unwritten) constitution. Burke characterizes the constitution of the British state as essentially conservative in the sense that property and legal precedent are the foundations of a stable society. Legal practices, laws of inheritance, and the representational scheme are reformed slowly if at all, for these constitute the accumulated wisdom of ages. Burke makes these arguments with the assistance of a particularly emotive rhetoric, suffused with a staged nostalgia for chivalry, and with gendered

images of the nation and its protectors. A famous passage in *Reflections* depicts Marie Antoinette as an almost angelic figure whose feet barely touched the ground, while the revolutionaries who roused her out of Versailles are “brutish” and might have raped her had they had the chance. Burke laments that in the old days of high chivalry, 10,000 swords might have leapt to her defense. Burke drew on the language of “sensibility” more frequently found in novels, poetry, and dramatic literature than in political treatises.

Wollstonecraft directly confronts Burke’s rhetoric, employing irony to expose his postures of solicitude for the compromised Marie Antoinette, and his breathless admiration for a quickly vanishing European chivalry. As a self-described philosopher—a term that she uses to mean she is an erudite and analytical writer—Wollstonecraft goes further and deeper than her apparent mockery of Burke’s writing. Wollstonecraft recognizes the source of Burke’s highly gendered images in his earlier work, *A Philosophical Enquiry into the Origins of Our Ideas of the Sublime and Beautiful* (1757), an influential treatise on what would later be called aesthetics, which categorizes sense perceptions as male or female. Beneath the ironic and personal tone that was typical of political tracts of the eighteenth century, Wollstonecraft’s *Rights of Men* undermines the rhetoric of *Reflections* by addressing its philosophical underpinnings.

Wollstonecraft does not restrict herself to a cultural critique of Burke’s work. For Wollstonecraft, Burke’s ultimate concern is the preservation of property. Against this, she advocates for “natural rights,” on the one hand, and the principle of civic duty, on the other. The slave trade and the “pressing” of poor and usually propertyless men—something Burke seems prepared to rationalize within his account of the constitution—would not occur if natural rights were prioritized. Moreover, Burke’s exaltation of local interest in family and property is an abdication of duty to society at large. Thus, *Rights of Men* contains both prototypical ideas of modern liberalism as well as elements of classical republicanism. The text ends by returning to the issue of gender, arguing that exaggerated modes of femininity prevent women from pursuing a robust program of self-development.

A Vindication of the Rights of Woman

In her more extensive political work, *A Vindication of the Rights of Woman*, Wollstonecraft did not press for an extension of the rights found in the Declaration of the Rights of Man of the French Republic or the Bill of Rights attached to the American Constitution. Instead, she asked that women be educated equally. This would allow them to fulfill their traditional domestic duties more effectively but could also potentially prepare them for a life of worldly activity in commerce, literature, or even as single heads of households. The disruption this implied to the patriarchal structure of most Western societies at this point—whether monarchist or republican—was still in the realm of political fantasy for many of her readers. *Rights of Woman* makes its case by means of an acute cultural analysis. Wollstonecraft describes how gender roles are established through a double standard in education and childrearing in which little girls are debilitated from the start, cut off from the more rigorous physical and intellectual activities that boys took part in, and thus losing a chance at developing their full potential. These practices had been condoned and reinforced by generations of writers in education, philosophy, and theology, among other genres. Wollstonecraft's role as a reviewer for the *Analytical Review* put her in an ideal position to approach her subject in this way. By 1792, she had written more than 300 reviews, and *Rights of Woman* contains many of the elements found in these reviews, including close reading, comparison of passages, and discussions of the intent of the author and social context of a text. This background translates directly into politically charged criticism of texts in *Rights of Woman*, where her primary targets are the works of John Milton, Jean-Jacques Rousseau, and John Gregory, a selection that represents different periods, genres, and nationalities. The range of this selection implies that a patriarchal regime that keeps women from attaining their full development persists over time, in different cultures, and across categories of writing.

One of Wollstonecraft's central ideals is a society that allows for the self-determination of the individual, a concept later associated with modern liberalism. Wollstonecraft—nominally an Anglican but greatly influenced by Dissenting religious writing—was practically alone among the reformist and radical thinkers of her time first in extending this ideal to women and

second in grounding her argument on religious principles. The presence of religious principles in *Rights of Woman* has only begun to be investigated. The influence of anti-Calvinist thought, primarily as it was expressed by Rational Dissenters such as Richard Price and the Latitudinarian thinker Joseph Butler, led her to adopt the principle of “earthly probation,” that is, the idea that life on Earth is a period of trial and the fate of the soul is not predestined. Wollstonecraft argued explicitly and directly from this principle to demand that women be allowed the fullest possible liberty in pursuing worldly activities. It is through worldly engagement that women can encounter the challenges that ultimately improve the soul. To block women’s access to the larger world of activity, as Barbara Taylor explains, is tantamount to denying them heaven. Although some cultural historians have long argued that Protestant hermeneutics lie at the roots of modern conceptions of political and economic identity, it is unusual to find a contemporary of Wollstonecraft who makes this explicit, and it is even more unusual to see individual liberty extended to women on this basis.

Wollstonecraft’s Uniqueness

The placement of *Rights of Woman* in its historical and political context has been a controversial topic among historians. One widespread theory states that *Rights of Woman* was not considered genuinely radical when it was first published. A strong reaction to her ideas set in only after the publication of William Godwin’s *Memoirs of the Author of the Vindication of the Rights of Woman* (1798), published after Wollstonecraft’s premature death following the delivery of her second child, the future writer of *Frankenstein*. In Godwin’s *Memoirs*, readers discovered that Wollstonecraft had had a child out of wedlock and became pregnant with another before marrying Godwin. They also read of her two suicide attempts after being rejected by the father of her first child. The revelations in *Memoirs* may have provided encouragement to her opponents, but her stature as a political and social thinker rested on the subversive nature of her ideas. This is clear in the many responses to Wollstonecraft in the years following her death, responses that may have been somewhat hysterical and vehement but also intellectually thorough. Wollstonecraft was a writer to be reckoned with. Although it is true that other writers before Wollstonecraft called for better education for women, and even declared the intellectual equality of women,

these schemes were usually gendered; that is, education for women was to be distinct from that of men because it was considered a preparation for a domestic life. Conversely, Wollstonecraft's definition of woman as a social and political being is more progressive than that of many of her predecessors: In *Rights of Woman*, she writes that women's "first duty is to themselves as rational creatures, and the next, in point of importance, as citizens, is that, which includes so many, of mother." This was an inversion of priorities that only a few of Wollstonecraft's contemporaries, and indeed generations of readers afterward, could accept.

Wollstonecraft's politics have also been identified with one strand of classical republican discourse, but she adapted this line of thinking to a pro-woman agenda that had not appeared in the works of her predecessors. For Wollstonecraft, women should cultivate physical robustness, stoic courage under hardship, and most significant, a sense of civic duty. In the writings of Burgh and Price, an individual develops a sense of civic duty from education in politics and history, and from the fact of being the head of a household, where mutual duties and obligations within the family are a basic training in those duties and obligations incumbent on every citizen. Here is the point, however, where Wollstonecraft breaks new ground. In many social models grounded in republican thought, women's role in the polity consisted in remaining within the family as the primary educator of future (male) citizens and providing stout support to their husband. This is the ideal of "republican motherhood" that formed an important part of the culture of the early American republic for instance. Although Wollstonecraft agrees that domestic relationships are the proper matrix for civic identity, and that motherhood is a desirable and natural role for women, she insisted that public and domestic roles for women were not mutually exclusive. Even though many women of her time found the means to overcome the barrier between domestic and public spheres of activity, Wollstonecraft argued for the utter reformation of social models that envisioned women's primary sphere of activity outside of the public. Throughout her work, Wollstonecraft is concerned with women's potential public functions. This, as well as her analysis of gender, and how it profoundly influences the establishment and stability of sociopolitical systems, places Wollstonecraft among the key founders of modern political thought.

Young Hegelians

Young Hegelians

867

868

Young Hegelians

The Young or Left Hegelians were a loose association of students and followers of Georg Wilhelm Friedrich Hegel (1770–1831), who were active especially in the 1830s and 1840s. Often embroiled in intense controversy with conservative adversaries, and among themselves, their disagreements acquired systematic expression in debates about religion. In 1837, responding to accusations that Hegel's system was pantheistic, David Friedrich Strauss (1808–74) distinguished “Right,” “Center,” and “Left” Hegelianism: While Center Hegelians like Karl Rosenkranz (1805–79) sought compromise, Right Hegelians such as K. F. Göschel (1784–1861) defended Hegel's orthodoxy, and Left Hegelians like Strauss re-interpreted Christian doctrines. Politically (although these lines are porous), the Hegelian Right stressed accommodation with existing authorities; the Left demanded extensive reforms. With their shifting alliances, mutual polemics, and regional differentiations, the Young Hegelians never presented a united front. Typically, southern Germans like Strauss assumed liberal-constitutionalist positions, while those in the Prussian territories became increasingly radical in response to the militantly conservative, anti-Hegelian offensive of the so-called “Christian state” of Friedrich Wilhelm IV (ruled 1840–61).

Strauss's *Life of Jesus, Critically Examined* (1835–36) depicted the Christian doctrine of the incarnation as a mythical expression of the *unity* of the human and the divine. Strauss interpreted this doctrine in Hegelian

terms as the realization of reason in the world, not through Christ as unique mediator, but as a collective task of the human species.

Bruno Bauer (1809–82) rejected Strauss's idea of a collective mythic consciousness. He interpreted Christianity to symbolize not the generic *perfection* of the human race, but individual *freedom*, the ability of each person to transcend immediate interests and promote a general good. Defined as “universal self-consciousness,” this was a positive freedom in which particular interests were voluntarily sacrificed if incompatible with universal emancipation. Such rational autonomy was a uniquely modern possibility, opened by the collapse of traditional social hierarchies. The alternative was the stagnation and conformism of mass society. Bauer increasingly identified religion with alienation, inimical to personal and political freedom. Debating Jewish emancipation, he argued that the solution was the mutual renunciation of religion. After the defeat of the 1848 Revolutions, Bauer wrote anti-Semitic works. In the 1840s, however, he defended republican popular sovereignty.

In *The Essence of Christianity* (1841), Ludwig Feuerbach (1804–72) described the divine attributes as an alienating projection of collective human powers; religious orthodoxy fetishized these powers, constructing a transcendent, divine person, and diminishing possibilities for earthly happiness. Religious alienation contributed to the egoism and dualism of modern society, the split between mind and body, self and other, and self and nature. Rejecting Hegel's idealism as symptomatic of this split, he developed a sensualistic naturalism and an ethic of love and ecological restraint. He influenced Karl Marx (1818–83), Friedrich Engels (1820–95), Moses Hess (1812–75), and the composer Richard Wagner (1813–83).

Many Young Hegelians stressed the economic dimensions of alienation. Eduard Gans (1797–1839), a progenitor of the Hegelian Left, synthesized Hegel with French social thought, describing poverty and concentrated wealth as limiting the progress of freedom. He advocated workers' associations to counterbalance the bargaining power of capital owners, while rejecting socialist ideas of collective property. He stressed the importance of an institutionalized political opposition to maintain freedom.

Viewing alienation as the reduction of workers to instruments of others' wills for purposes of private accumulation, Karl Marx argued for the transformation of capitalist economic relations, rather than for exclusively political reform. Friedrich Engels's markedly Feuerbachian 1845 text, *The Condition of the Working Class in England*, attributed the emergence of urban poverty to capitalist industrialization and heralded the overcoming of alienation through recognition of species-consciousness or common interests.

After lengthy imprisonment for republican political activities, Arnold Ruge (1802–80) edited numerous publications and promoted collaboration among the Young Hegelians. Ruge defended the Enlightenment heritage of the Prussian state against advancing conservatism, and after 1840, he censured the regime for succumbing to irrationalist Romantic and pietistic influences. He advocated popular sovereignty, criticizing Hegel's theory of the state for its irresolute republicanism. He promoted Franco-German cooperation as the key to political progress. A republican-democratic delegate to the Frankfurt National Assembly in 1848, he remained committed to progressive politics in exile.

In *The Ego and His Own* (1845), Max Stirner (1806–56) rejected republicanism, democracy, and socialism in favor of anarchism. Rather than castigating egoism, his concept of "ownness" or uniqueness extolled it. All universals or ideals were mere fetishes; particular interest alone defined freedom. Stirner viewed the state not as a Hegelian ethical community but as an obstacle to self-affirmation, and he advocated evasion of all political restrictions and the overcoming of conventional morality. Echoes of Stirner recur in Friedrich Nietzsche.

The Young Hegelians diagnosed problems of freedom and alienation in modern life, the politicization of religion, and social and economic exclusion. Although frequently dismissed as mere transitional figures between Hegel and Marx, their distinctiveness is recognized in recent research. Their influence extends from theology to philosophy to economics and political theory.

Zionism

Zionism

869

872

Zionism

Zionism is an ideology that seeks to apply the universal principal of self-determination to the Jewish people. It was born in Europe at the end of the nineteenth century based on the realization that Jews would not be able to become free and equal citizens within the emerging European political order, nor would they be physically safe there. Jews would be able to become free, early Zionists reasoned, only if they formed a national liberation movement of their own and strived for their own nation-state. The political logic at the heart of Zionism thus led from the desire for liberty and equality to the ideal of a democratic nation-state for the Jews and, finally, pointed to the land of Israel. In this Zionism differed from the age-old yearnings of Jews to return to the ancient homeland—Israel was Zionism’s conclusion, not its point of origin—but it did follow closely in the footsteps of, and was a reaction to, the general trends of European politics and political thought.

Historical Background

Before the emergence of Zionism, many Jews staked their hopes on the Enlightenment’s ideals and believed that the general march of human progress toward liberty and equality would solve the predicament of dispersed Jewish minorities. Universal civil rights, detached from questions of identity—states indifferent to race, religion, and culture—would dissolve old religious prejudice against Jews. Jewish citizens would be able to

preserve their unique identity in the private sphere, while in the public sphere they would just be citizens like all others. “Be a human being outside and a Jew in your own home,” wrote the Jewish Enlightenment poet and thinker Yehuda Leib Gordon.

But the formula failed: first, because it was designed to accommodate religious identities, while many Jews were becoming secular and were searching for nonreligious—cultural or even national—terms to redefine Jewish peoplehood. Second, it turned out that the political underpinnings of modern liberty were for the most part not at all detached from identity. The question of liberty and equality for Jewish minorities became an intersection where the relations between identity and liberty were tested, producing some of the most progressive, as well as some of the most reactionary, consequences.

Modern conceptions of liberty were increasingly grounded in the realization that individual freedom is dependent on a political order in which citizens share in political sovereignty and retain control over their common fate. Liberty, in this view, would only be secure in democratic forms of government. But when democracies emerged, it turned out they were highly dependent on bonds of national identity. It was the national sentiment that produced the patriotism that, alone, could secure a public spirit. Without it there was nothing that could guarantee that citizens would use the vote with the common good, not just the private interest, in view. The modern democratic state in Europe was not an alternative to the order of nation-states; it was part and parcel of it.

Progressive Jews in the nineteenth century therefore had to revise their hopes to accommodate this emerging national order. It would not do to be a Jew in the private sphere and only a general human being outside it. If Jews were to become truly equal citizens, then outside their private homes they would need to be German, French, English, Russian, and so forth. Thus, Jews would be Jewish at home and members—indeed patriots—of the nations in which they resided outside it.

These fond hopes were soon crushed. Jews were often not seen, and many of them did not see themselves, as fully German, French, English, Russian, and so forth. Unless their identity was defined in strictly religious terms—

which for many was no longer the case—then it would not be easy to reconcile it with that of the nations of Europe.

Herzl and the Birth of Zionism

Theodor Herzl, the founder of political Zionism, clearly grasped this problem. He also saw why liberal and democratic tendencies in Europe, tied as they were to the nation-state, would increase rather than decrease the Jewish predicament: He witnessed how democracy bred a new and virulent form of anti-Semitism in Vienna where the first democratic municipal elections brought a populist anti-Semitic mayor to power; he saw how easily French republicanism gave rise to anti-Semitism at national crises and how French popular sentiments blamed the Jews as alien subversive elements. This was because Jews were conceived, indeed often conceived themselves, as having a collective identity that nation-states failed to accommodate.

Herzl's conclusions were complex, and his thought did not stop at the obvious conclusion that nationalism can turn into virulent xenophobia, from which Jews, especially, will suffer. He also came to believe that the problem had no solution within the existing order because, in his view, Jews were themselves a nation, and nations cannot reside within nations.

Conceiving Jewish identity in national terms, which Herzl began to argue for in his 1895 treatise *The Jewish State*, was neither trivial nor uncontroversial. Many Jews still saw their identity in religious terms, and some were seeking some intermediate cultural identity, neither religious nor national. But the force of Herzl's argument lay in its clarity and consistency: The Jewish Question had no answer within the existing nations of Europe because, Herzl thought, Jewish identity was of the same kind as that of the other nations. Any other answer to "the Jewish question" only led to paradox.

To the extent that national identities rest on historical narratives (to use our own contemporary terms), fully accepting a German, English, or Russian historical narrative would mean forsaking the historical narrative that defined Jewish identity in terms that were clearly collective. One finds it

hard to tell (and others find it hard to accept) two simultaneous different stories of one's origin. What Europe called the Emancipation of Jews did not fail because of anti-Semitism only. It failed, so Herzl believed, because in practice it forced Jews into a dilemma that they could not solve: Full assimilation (and the rights and liberties that come with it) would mean forsaking Jewish identity. Thus, it seemed Jews would be forced to choose between equal rights and Jewish identity; they would not be able to be free and equal as Jews.

If nation-states posed a new problem for Jews, Herzl came to believe, they also pointed in the direction of its solution. If Jews are a nation, then what suits other nations should suit them too. Like many other nations, the road to Jewish liberty lay in a national liberation movement. The logic was thus solidified: If liberty depended on a democratic form of government, and democracy depended on a national identity, then a Jewish democratic state seemed to Zionists to be the logical solution. There, just as gentiles were free to be gentiles, so would Jews be Jewish both in private and in public; only in such a state would they be able to be free as Jews.

But then came practical problems, which were by no means slight. The first of these would be finding a territory. Many different ideas for such a territory, practically all around the globe, rose and fell. Eventually it became clear that Israel was the only feasible location because if Zionism sought to make Jews free without giving up their Jewish identity, that is, without giving up their historical narrative, Israel was so central to that narrative that giving up all ties with it amounted to abandoning Jewish identity. Jews can live in many places, but a Jewish state can only come about in the old homeland. Thus, the political logic of self-determination led Zionism to converge with the old religious dream of returning to the holy land.

The founding of Zionism as a political movement followed closely on the heels of its political logic. It began with democracy. Indeed Herzl called the first Zionist congress, convened in Basel, Switzerland, a "national assembly," a term clearly intended to resonate with the French Revolution. This first congress installed a mechanism for democratic transference of power by instituting a membership fee that entitled members to vote. The

Zionist Organization became a kind of stateless democracy, which would then need to find a way to form a territorial nation state.

The Founding of the State of Israel

Faced with an unprecedented task, its subsequent political history was turbulent. But in 1947, Zionism received wide international recognition for the right of Jews to self-determination in the form of the United Nations partition resolution, which divided Palestine into two nation-states, one Arab and one Jewish. The Zionist leadership accepted the resolution, but its Arab counterpart did not. Thus, the founding of a Jewish nationstate in 1948 was achieved amid a brutal conflict with the local Arab population and the armies of the neighboring Arab states who waged a war to annihilate it at its birth.

Israel's declaration of independence bore the marks of its political origins. It inscribed the foundations of Zionism in the universal right of self-determination as the moral grounding of the state: "[It] is the natural right of the Jewish People," the declaration states, "to be like all nations, masters of their own fate in their own sovereign state."

The declaration also promised universal civil rights to all its citizens, regardless of race, religion, and gender, thus, detaching individual civil rights from questions of identity. Based on the Jewish experience in Europe, it also sought to avert the predicament of minorities in Europe's nation-states and added to individual civil rights collective rights for minorities that enable them to preserve their identity in the public as well as the private sphere, thus, elucidating a constitutional way for a nationstate to accommodate national, not only religious, minorities (eventually Europe followed suit in the European Union's Framework Convention for the Protection of National Minorities).

Recent Developments

Israel has not always remained faithful to these principles in its actual policies, most poignantly in the territories it has occupied since the 1967

Six Days War (most of which were never annexed and still retain the temporary legal status of Belligerent Occupation, outside Israel's international borders). A competing ideology, which, unlike the original creed, sought to define Israel's national identity along blood-and-soil lines, grew along with the attempt of the hawkish political Right to sustain the occupation. It was spearheaded by a religious messianic settler movement that struggled to replace the original Zionist creed. Although this movement and its many supporters managed to partially populate the occupied territories with Jewish settlers, it was never able to alter the constitutional structure of the state, which remains faithful to the original principles of Zionism. These principles are also what led the majority of Israelis—since the Oslo Accord of 1993—to support a two-state solution to the Israeli Palestinian conflict, a solution that, if implemented, would finally fully realize the 1947 United Nations partition resolution, and would further the same ideal that is the moral foundation of Zionism: the universal right of all nations to self-determination.
